QUESTION 2. On page 3 of your written testimony, you indicate that most States do not desire to assume responsibility for regulating wetlands use without assistance from the Federal government and that some States would be reluctant even with assistance. Why do you believe this is the case?

Answer. Based on the responses of 48 States to an OTA questionnaire about wetlands, twelve States have evaluated or are evaluating the possibility of assuming responsibility for administering a portion of the 404 program. Four are administering pilot programs to gain practical experience prior to possible program assumption. However, over two thirds of the States do not have the capability or desire to take on this responsibility without additional resources from the Federal government. Even with additional resources some States would be reluctant due to a desire to promote development and an opposition to land use controls. Another possible reason for State reluctance may be the requirement for States to develop their programs in accordance with EPA regulations that they may see as being too stringent. In addition, the scope of the areas that States would be given jurisdiction over may be too restricted to generate State interest. Since regulating the use of wetlands is often controversial, many States see few advantages in getting involved in this Federal program.

QUESTION 3. To what extent do you believe there exist opportunities to reduce unnecessary delays in reaching 404 permit issuance decisions? What suggestions do you have in this connection?

Answer. Over the past three years the Army has focused a great deal of attention on decreasing the delays in issuing 404 permits. According to one source, in 1980, the average permit processing time was about 130 days. However, Army Corps of Engineers' data for the last quarter of FY 1983 indicate that average processing time has decreased to about 70 days. It may be possible to decrease processing time even more over the short-term by further encouraging applicants to take advantage of pre-application consultations with the Corps, by improving coordination between the Corps and other Federal agencies and State regulatory programs, and by increasing the number of Corps personnel that are assigned to the program.

Over the long-term, permit processing time could be reduced by developing an integrated approach to wetlands management. This would involve three steps. First, the Fish and Wildlife Service's ongoing inventory of wetlands would be continued or accelerated. Second, the wetlands in an inventoried area would be categorized according to their relative values. And third, the 404 permit processing procedures could be "tailored" or adjusted based on the relative value of different wetlands. In this way, agency funding and personnel attention could be focused on high-value wetlands in different regions of the country instead of all wetlands in general. Regulators, developers, and the public would be aware of the status of wetlands in their particular region prior to any proposals to convert them to other uses and could plan accordingly. Thus, in addition to reducing permit processing time for a permit application, decisions about the use of wetlands would be more predictable and consistent.

QUESTIONS 4 AND 5. It has been suggested to the Committee that wetlands exemptions under section 404 should be granted for the following types of wetland areas: (1) lands adjacent to streams that either flow or overflow as a result of runoff waters; (2) lands adjacent to isolated lakes, potholes,

20-955 O—84——114

arroyos, intermittent streams and other waters that are not part of the tributary system to interstate waters or navigable waters; and (3) land areas containing wetlands-type vegetation as a result of irrigation practices. What recommendations do you have, either here or for the record, concerning this suggestion? It has also been suggested that the definition of navigable waters for purposes of section 404 should be narrowed to eliminate (4) artificial and/or seasonal wetlands. What comments would you have concerning this proposal?

Answer. If section 404 is intended to protect only the quality of the Nation's waters, then lands adjacent to isolated lakes, potholes, arroyos, intermittent streams and other waters that are not part of the interstate tributary system could be exempted, as could most wetland areas resulting from irrigation practices and artificial and/or seasonal wetlands. However, if section 404 is intended to protect other wetland values, such as food and habitat for wildlife, then none of the types of wetland areas described in questions 4 and 5 can be generically excluded without the risk of exempting some high value wetlands along with those of lesser value.

QUESTION 6. Approximately what percentage of the converted wetlands that you discuss would have required permit action under section 404? That is, which were lost because of deposition of dredged and fill material and which were lost for other reasons?

Answer. Between the mid-1950's and mid-1970's, wetlands were being converted to other uses at a rate of about 550,000 acres per year. About 80 percent of these coversions were for agricultural uses and generally not regulated by either 404 or State programs. In fact, normal farming activities are specifically exempted by section 404. The remaining 20 percent were converted by activities that involved the disposal of dredged or fill material and in all likelihood would have fallen within the jurisdiction of the Corps' 404 program had it existed during that time period.

Please let me know if you or your staff have any further questions about the use of wetlands in the United States or about the responses to these questions.

Sincerely,

William D. Barnard

William D. Barnard
Director, Wetlands Project

cc. Mr. Joseph A. Italiano
Public Works Committee Editor

Mr. McNULTY. Thank you. Dr. Barnard, thank you.

Dr. BARNARD. Thank you very much.

Mr. McNULTY. Thank you for submitting to a certain amount of mischievousness here this afternoon. We are grateful for your testimony. How long have you been at OTA?

Dr. BARNARD. Approximately 5 years, sir.

Mr. McNULTY. If you have suffered mischievousness at the hands of anyone else named McNulty, I owe you an apology.

Dr. BARNARD. OK, thank you.

Mr. McNULTY. Our next witnesses are from Texas, Carson H. Hoge, general manager, Brazos River Authority, Waco, Tex., and I. M. Rice, executive vice president of the Trinity Improvement Association from the home of the Dallas Cowboys and testifying in behalf of the National Water Resources Association.

Mr. Hoge, Mr. Rice, good afternoon and welcome.

The full text of yor prepared statements will apear in the record at this point.

[Statements referred to follow:]

STATEMENT OF BRAZOS RIVER AUTHORITY, IN SUPPORT OF AMENDMENT OF SECTION 404 OF THE FEDERAL WATER POLLUTION CONTROL ACT

The Brazos River Authority is an agency of the State of Texas created in 1929 and given statutory responsibility for conservation and development of the surface water resources of the Brazos River Basin in Texas, an area of about 42,000 square miles. Although it is a political subdivision of the State of Texas, the authority does not levy taxes and does not receive appropriations from the State, but is entirely self-supporting, utilizing revenues from its own operations to pay all of its costs.

In carrying out its statutory responsibilities, the Authority has financed, built and operates three major reservior projects of its own, and has contracted with the Federal government for use of the conservation storage space in nine Corps of Engineers reservoirs in the Brazos Basin. These reservoirs are operated as elements of a basin-wide water supply system to meet municipal, industrial and agricultural needs. This reservoir system has a total conservation storage capacity exceeding 2.1 million acre-feet, and a total long-term dependable water supply yield exceeding 600,000 acre-feet. Utilizing this system, the Authority supplies water from reservoir storage for municipal use to more than 60 cities, towns and water districts througout the Brazos Basin. The Authority also owns and operates more than 200 miles of canals through which it can supply up to 237,000 acre-feet of Brazos River water for municipal, industrial and agricultural uses in the Gulf coastal area south of Houston.

Water quality enhancement and protection are also primary objectives of the Brazos River Authority. The Authority owns and operates three regional sewage systems to help protect the quality of surface waters in the Brazos Basin. The Authority has developed and helped to implement the State's water quality management plan for the Brazos Basin and is presently engaged in a number of studies and management programs to identify and control non-profit sources of water pollution, both man-made and natural, in specific areas throughout the Brazos Basin.

The Section 404 permit program, as currently applied, results in needless delay and expense to agencies such as the Brazos River Authority in the development of vital water resoure projects at a time when the States and their political subdivisions are being urged by the Federal government to undertake greater responsibility for meeting the needs of their citizens.

Two actual Brazos River Authority projects, one now in planning and one in operation, best illustrate how the Section 404 permit program results in needless waste of both time and public funds.

The project in planning is Lake Bosque about 40 miles northwest of Waco, Texas, on the Bosque River, a tributary of the Brazos River. Planning on this project was initiated at the request of the City of Waco and nine smaller municipalities in Bosque and McLennan Counties. All of these cities other than Waco are presently dependent on dwindling groundwater supply sources. The City of Waco currently obtains its water supply from Lake Waco, a Corps of Engineers reservoir project, under contract with the Brazos River Authority. The combined municipal needs of the area are projected to exceed the dependable yields of Lake Waco and the area's groundwater sources in the relatively near future.

The Lake Bosque project will involve no expenditure of Federal funds whatsoever. The project will be financed entirely by Brazos River Authority through the issuance of revenue bonds based on water supply contracts with the participating cities. Because of the limited financial resources of the relatively small cities and rural areas it will serve, it is essential that Lake Bosque project costs be kept to the minimum consistent with sound development.

When completed, Lake Bosque will cover about 4,500 acres and will have a long-term dependable water supply yield of about 16,000 acre-feet per year. The project site is in the upper Bosque River watershed, barely within the prescribed reach of the Bosque River where a Section 404 permit is required.

The total estimated cost of the project in 1983 dollars is $33,200,000, including direct costs for obtaining the 404 permit. It is estimated that the direct costs associated with obtaining the 404 permit will be $800,000, not including any allowance for possible mitigation costs, which cannot be estimated at this time. The time required to obtain a 404 permit is estimated to be 305 calendar days more than that required to obtain all necessary State and local approvals. The increase in construction costs caused by this delay in beginning actual construction is estimated to range from a low of $1,660,000, assuming a 6 percent inflation rate, to a high of $2,766,667 at a 10 percent inflation rate. Taking a middle rate, 8 percent inflation, the permitting delays will cost the project participants an extra $2,213,333. Coupled with the $800,000 in direct costs, the total of the costs that will be added to the project just to obtain the 404 permit are estimated to be $3,013,333, or a 9.1 percent increase in estimated project costs, not including any allowance for mitigation costs which may be imposed on the project under the terms of the 404 permit.

Based upon amortizing the revenue bonds issued to finance construction of the project over a 25-year period at 9 percent interest, the estimated additional $3,013,333 direct and inflation costs imposed on the project to obtain the 404 permit will cause a $306,776 increase in the annual payments required of the users of water from the project.

The very substantial cost burden cited above is just for preparing, submitting and following through on the processing of the 404 permit application. If mitigation requirements are imposed as conditions for issuance of the 404 permit, their costs will be in addition to those summarized above. While these additional costs, in both time and public funds, are not quantifiable at this time, the Authority's past experience in the development of its Lake Limestone project indicates that they can be substantial.

In 1973 the Authority began planning for the construction of Sterling C. Robertson Dam and Lake Limestone on the upper Navasota River, a tributary to the Brazos River, to furnish water supplies needed to develop and utilize extensive lignite reserves in the area for thermal generation of electricity. Since no federal funding was involved in the financing of the project, and since the Navasota River, with flows of less than five cubic feet per second more than 25 percent of the time and zero flow for periods of up to 100 consecutive days, is not now nor ever has been navigable, no Federal interests were considered to be involved in the project. In fact, the Authority asked the Corps of Engineers whether any Federal government permits or approvals were required, and by letter dated July 19, 1974, the Corps informed the Authority that none was needed.

In accordance with State law, the Authority applied to the Texas Water Rights Commission for a permit to construct the project, and, after a public hearing by the Commission, a State permit was granted on October 1, 1974.

In June 1975 the Authority advertised for construction bids, sold $30 million in revenue bonds to provide the first increment of financing for the project, and on July 21, 1975, awarded a contract for construction of the dam and related facilities.

Subsequent to the initiation of construction, the Corps of Engineers was required by court order to publish revised Section 404 regulations, making its permit program for discharge of dredged or fill material into navigable waters applicable to the Navasota River beginning July 1, 1976. Accordingly, on October 9, 1975, the Authority submitted an application for a Section 404 permit for Sterling C. Robertson Dam and Lake Limestone. The Authority also agreed to pay an estimated $35,000 to underwrite the expenses of the Corps of Engineers to approve and reissue an Environmental Assessment previously prepared by the Authority and considered by the Texas Water Rights Commission before issuing the State permit for Lake Limestone.

The Corps circulated the Authority's permit application to a myriad of Federal agencies for comment, and no objections to the issuance of the permit were received from any of them until February 2, 1976. At that time the U.S. Fish and Wildlife Service recommended that the permit be denied unless the Authority agreed to pur-

chase 15,800 acres of land (in addition to the 15,000 acres required for the dam and lake) for use as wildlife management areas to be administered by the Texas Parks and Wildlife Department. The Authority strenuously objected to this recommendation on the grounds that taking an additional 15,800 acres of farm and ranch land out of private ownership to create a wildlife management area where none had existed before was contrary to the public interest, that the Authority had no source of funds to pay the enormous costs that such an acquisition would require, and that, other considerations aside, the Brazos River Authority has no legal authority to take land from private ownership for such use. The Authority's position on the matter was strongly supported in writing and in public statements by the citizenry of the project area, by numerous local governmental units and by the Governor of the State of Texas.

In December 1976, the U.S. Fish and Wildlife Service reduced its demands from 15,800 acres to 5,000-6,000 acres and demanded that construction of the project be halted pending resolution of the Section 404 permit question. In view of the strong State and local support for the project and the fact that the requirement for a 404 permit was applied to it retroactively, the Corps of Engineers allowed the Authority to proceed with construction while the Section 404 permit dispute was elevated from the District Engineer to the Division Engineer to the Chief of Engineers and finally to the Secretary of the Army for resolution.

As the project neared completion, the Authority's Board of Directors was faced with the possibility that Lake Limestone could not be placed in operation to perform the water supply function for which it was designed because of the continuing dispute over issuance of the 404 permit. To eliminate this threat, the Authority's Board reluctantly agreed in October 1977 to the terms of a Section 404 permit which required the Authority to commit and set aside $500,000 from its working capital to be used for acquisition of land or interests in land for wildlife mitigation purposes, on the basis of advice from and subject to the concurrence of the U.S. Fish and Wildlife Service and the Texas Parks and Wildlife Department. Finally, in April 1978, more than 900 days after the permit application was submitted, a Section 404 permit for Lake Limestone was issued.

This issue is still unresolved. It has thus far not been possible to obtain lands for wildlife mitigation in accordance with criteria established by U.S. Fish and Wildlife Service and Texas Parks and Wildlife Department. Five hundred thousand dollars of the Authority's working capital is unavailable for use and enormous amounts of public and private time and money have been wasted because of mitigation demands imposed in obtaining a permit under Section 404 of the Federal Water Pollution Control Act. The bureaucratic permit requirements imposed on the project were totally unrelated to water quality and no justification based upon the public interest was ever established.

The problems encountered by the Brazos River Authority on these two projects in connection with the Section 404 permitting process are typical of those faced by the Authority and similar agencies throughout the nation on every project undertaken to meet the water supply needs of their citizens. The Federal Clean Water Act urgently needs to be amended to eliminate the unnecessary delays and expenses that Section 404 of the Act in its present form presently imposes on needed water resource development.

The National Water Resources Association, of which the Brazos River Authority is a member, has long called for amendment of Section 404 to alleviate the problems it causes to the Association's members. The Association has adopted a resolution which sets forth specific proposals for amending Section 404 to help achieve this objective. The Brazos River Authority endorses and urges that the proposals of the National Water Resources Association be incorporated into amendments of the Clean Water Act.

STATEMENT OF DR. I. M. RICE, EXECUTIVE VICE PRESIDENT, TRINITY IMPROVEMENT ASSOCIATION

Mr. Chairman and Members of the Committee, my name is I. M. Rice, of Irving, Texas, and I am speaking in behalf of the Trinity Improvement Association. This is a basin-wide organization of citizens who are dedicated to the wise use and development of the Trinity River basin in Texas.

I am most grateful to appear before you in order to recommend amendment of the Clean Water Act, particularly Section 404. I will present to you our views as to problems arising from the present language of the Act, comment briefly on H.R. 3282 and make suggestions as to how the Clean Water Act might be improved.

You have just heard testimony from Mr. Carson Hoge concerning specific problems he has encountered with the Act. When I appeared before this committee on July 28, 1982, during the last Congress, I cited a number of specific examples in Texas and throughout the nation where the requirement to comply with Section 404 has resulted in needless costs without commensurate benefits. I will not repeat this testimony but will update those earlier comments in the light of developments since a year-and-a-half ago.

Next, I would like to address what are perceived to be undesirable features of H.R. 3282. By way of background, in 1980, over 10,000 Section 404 permit applications were submitted and more than 8,000 permits were granted. The cumbersome review process was far too slow. Overlapping agency jurisdiction and repetitive reviews by each layer of the federal hierarchy nullified adherence to any reasonable time schedule. For controversial applications, the processing time averaged 271 days.

H.R. 3282 would amend Section 404(b) making the guidelines regulatory in nature. This has the effect of establishing a presumption that a proposed discharge will be prohibited unless the guidelines are met. It is recognized that the guidelines should and will be followed, but if they are made regulatory, it opens up any alleged variation from the guidelines to third party litigation. Adherence to the guidelines should be a matter for executive department to decide, not offer a fertile hunting ground for project opponents to find ways to transfer the decision to federal court and, if noting more, delay the project.

One of the goals of this administration has been to reduce paper work and streamline government procedures. Assistant Army Secretary Giannelli was assigned the task of preparing a memorandum of agreement on the processing of applications for Section 404 permits. Significant accomplishments of Mr. Giannelli's rules included setting an objective of processing a permit in 60 days unless an environmental impact assessment was required. Agencies were given specific time limits in which to respond to an application. Moreover, it had become customary to delay issuance of permits by reraising the same issues at the successive hierarchical levels of government. The general permits:

Section 404(e)(1)—Authorize the Secretary to issue general permits for head waters and isolated waters.

Section 404(e)(2)—Rather than automatically expiring at the end of 5 years, general permits should be subject to review at the end of 5 years.

Lastly, and most importantly, it is urged that Congress clarify the wetlands issue. The Clean Water Act has been used to impose federal control of land use on the individual property owners. Any unbiased person recognizes that some of the partially or periodically inundated lands in this country are a national resource whose total destruction would be a national loss. The problem is to define or delimit wetlands in a way that the ordinary citizen can understand. Surely not every damp spot in the United States warrants federal control.

Determination as to what constitutes a wetland is an uncertain process. It varies from district to district, from biologist to biologist. Some developers would want a definition that left them free of any control. Some no-growth advocates and ardent environmentalists would preserve every inch of land that could possibly be defined as a wetland. The federal government can bring enormous resources to bear in a disputed case and, to some federal agencies, the amount of time and, effort consumed on an application review is not a consideration. Sometimes the owner gives up on what he believes to be just because of the inability to cope with the federal forces ranged against him.

Mr. McNULTY. Please proceed.

TESTIMONY OF CARSON H. HOGE, P.E., GENERAL MANAGER, BRAZOS RIVER AUTHORITY, WACO, TEX.; I. M. RICE, EXECUTIVE VICE PRESIDENT, TRINITY IMPROVEMENT ASSOCIATION, IRVING, TEX.

Mr. HOGE. Thank you, Mr. Chairman, members of the subcommittee. I am Carson Hoge, general manager of the Brazos River Authority of Texas. I am appearing here today both in that capacity and on behalf of the National Water Resources Association to urge amendment of the section 404 of the Federal Clean Water Act.

In addition to this oral statement, we are submitting more extensive written testimony on behalf of both the Brazos River Authority and the National Water Resources Association, and I ask that this written testimony be incorporated into the record.

Mr. McNulty. It has been made a part of the record. Thank you.

Mr. Hoge. The National Water Resources Association, which was founded in 1932, is a confederation of State water users associations in the 17 continental Western States and Hawaii. The objectives of the association include promotion of the development, control, conservation, preservation, and beneficial utilization of the water resources of the Nation; development of irrigated lands for present and future generations; cooperation with and assistance to Federal water resource development agencies in securing authorization, appropriation of funds, and construction of Federal water resource projects which meet with the approval of the States and localities affected; assistance to States and their water users in the economic development and operation of water improvements; preservation of the rights and interests of the States in their water resources; and the promotion of legislation in furtherance of, and opposition to legislation detrimental to, these purposes.

For a number of years, the association and its individual members have consistently urged amendment of section 404 of the Federal Clean Water Act and adoption of administrative reforms to the section 404 permit program to reduce the costly and time-consuming burdens they impose on State, regional, and local water resource development agencies in their efforts to complete water resource projects necessary to meet the needs of their citizens.

The problems faced by the Brazos River Authority in connection with a project it currently has under development is typical of the burdens imposed by the section 404 permit program on all of the members of the National Water Resources Association and on water resource development and management agencies throughout the Nation.

The Brazos River Authority is an agency of the State of Texas created in 1929 and given statutory responsibility for conservation and development of the surface water resources of the Brazos River basin in Texas, an area of about 42,000 square miles stretching across the heart of Texas from the New Mexico border to the Gulf of Mexico. Although it is a political subdivision of the State of Texas, the Brazos River Authority does not levy taxes and does not receive appropriations from the State of Texas, but is entirely self-supporting, utilizing revenues from its own operations to pay all of its costs.

I might digress from the written statement here, Mr. Chairman, to point out and emphasize that the Brazos River Authority and others who are members of the National Water Resources Association support completely the objectives of the Clean Water Act, including the objectives of section 404 of that act. We spend a great deal of our time in the field in the expenditure of time and effort and money to achieve those purposes.

The authority itself is engaged extensively in water quality protection activities throughout the Brazos basin. And I am sure that is true of other members of the association as well. Our concern is with the problems that we feel are unnecessary impediments to

water resource development that result from the way in which section 404 now is interpreted and administered. And my testimony today, my oral testimony, will concentrate on bringing to you an example of how that has occurred, an actual example of how that is occurring at this present time in connection with a project we are trying to develop that we think will show the impact of 404.

Dr. Rice, who represents the Trinity Improvement Association here today will then give you some elaboration. He will supplement my testimony by elaborating on what we think could be done to improve this situation.

Mr. McNULTY. All right.

Mr. HOGE. In carrying out its statutory responsibilities, the Brazos River Authority has developed a basinwide water supply system consisting of 12 major reservoirs with a total conservation storage capacity exceeding 2.1 million acre-feet and a long-term dependable yield of more than 600,000 acre-feet of water per year. The authority also owns and operates three regional sewerage systems and engages extensively in other programs directed toward enhancement and preservation of water quality.

Problems experienced by the Brazos River Authority with the section 404 permit program are typical of the needless delays and added expenses encountered by water resources development agencies throughout the Nation in trying to meet the water supply needs of the citizens they serve.

The authority is currently engaged in planning for the development of a lake on the Bosque River, a tributary of the Brazos River, to furnish the water supplies needed to meet the near- and long-term future needs of the city of Waco and nine smaller municipalities and rural areas in Bosque and McLennan Counties in central Texas. This project will involve no expenditure of Federal funds whatsoever; it will be financed entirely by the Brazos River Authority through the issuance of revenue bonds based on water supply contracts with the water users. Because of the limited financial resources of the relatively small cities and rural areas it will serve, it is essential that the Bosque project costs be kept to a minimum consistent with sound development.

The total estimated cost of the project in 1983 dollars is $33,200,000, including the direct costs estimated for obtaining the section 404 permit. It is estimated that the direct costs associated with obtaining the 404 permit will be $800,000, not including any allowance for possible mitigation costs, which cannot be estimated at this time. The time required to obtain a 404 permit is estimated to be 300 calendar days greater than that required to obtain all necessary State and local approvals, and the increase in construction costs caused by this delay in beginning actual construction combined with inflation is estimated to be more than $2 million.

Coupled with the $800,000 in direct costs, the total of the costs that will be added to this project just to obtain the 404 permit are estimated to be more than $3 million, or a 9-percent increase in estimated project costs, not including any allowance for mitigation costs which may be imposed on the project under the terms of the 404 permit. Based upon the estimate that the revenue bonds issued to finance the project will be amortized over a 25-year period at 9-percent interest, the total estimated additional costs imposed on

the users of water from this project just for preparing, submitting, and following through with the processing of the 404 permit application will be $7,670,000.

If mitigation requirements are imposed as conditions for issuance of the 404 permit, their costs will be in addition to those summarized above. While the additional costs of mitigation cannot be quantified at this time, actual experience on other authority projects in the past would indicate that they could be very substantial both in time and in expenditures of public funds.

Both the written testimony of the National Water Resources Association and the testimony of the Trinity Improvement Association of Texas at this hearing include specific proposals for amendments of section 404 of the Clean Water Act. The Brazos River Authority endorses these proposals and respectfully urges that they be incorporated into amendments of section 404 in order to relieve the water resources program of this Nation of the unnecessary burdens of delay and expense that the section 404 permitting program presently imposes on it.

Mr. McNulty. Mr. Hoge, thank you.

Mr. Rice, we would be pleased to hear from you now.

Mr. Rice. Mr. Chairman, members of the committee, my name is I. M. Rice, of Irving, Tex., and I speak on behalf of the Trinity Improvement Association. You have my remarks in front of you.

I may digress from time to time for amplification.

This association is a basinwide organization of citizens. It is publicly supported, nonprofit, and we are devoted to the wise use and development of the Trinity River basin in Texas.

I would like to present to you our views as to problems arising from the present language of the act, comment briefly on H.R. 3282, and make suggestions as to how the Clean Water Act might be improved.

You have just heard testimony from Mr. Carson Hoge concerning specific problems he has encountered with the act. I appeared before this committee on July 28, 1982, during the last Congress. At that time I cited a number of specific examples in Texas and throughout the Nation where the requirement to comply with section 404 has resulted in needless costs without commensurate benefits.

I will not repeat this testimony. I have a copy of it with me, if you would care to have it.

I would like to update where we stand today.

First, the Clean Water Act. There is confusion and uncertainty which accompanies Federal enforcement of section 404. I would like to cite a recent example to you. That is the case of the Avoyelles Sportsmen's League versus Secretary of the Army John Marsh. The case involved the clearing of a 20,000-acre tract on the Avoyelles Parish of Louisiana. It is a part of the Bayou Natchitoches basin. There are about 140,000 acres in that basin and about 60,000 had already been cleared.

The owners of the 20,000-acre tract which still had forest on it wanted to convert that to agricultural land. They wanted to raise soybeans. They started this conversion action in 1978 but on August 25 of that year, the Corps of Engineers ordered the owner

of the land, Mr. Prevo, to halt his operations pending a decision on wetlands.

The corps made a study and their expert determined that 35 percent of the 20,000 acres constituted wetlands and would require a 404 permit. But, following that, the sportsmen's league brought suit claiming that section 404 of the Clean Water Act was being violated.

This was taken before the court of Judge Scott in the western district of Louisiana.

He granted an injunction against any further clearing pending determination of the EPA as to the extent of the wetlands.

About a year later, in March 1979, EPA determined that 80 percent of the tract was wetlands. We had 35 percent; now we have 80 percent. But the court then decided that 90 percent of the tract was wetlands and required that before any more clearing of any of that 90 percent of the tract could be undertaken, a 404 permit was required.

This case was appealed to the fifth circuit court in New Orleans, which overruled the judge, stating that he should leave it up to the administrative agencies to determine the extent of wetlands, which had the effect of leaving the 80 percent in control.

The point I am trying to make is this. Three presumably competent and sincere entities viewed an identical problem and came up with three different answers: 35 percent, 80 percent and 90 percent.

That is really too big of a spread. Surely it would be beneficial to the citizens if Congress would clarify its intention as to what is and what is not wetlands within the meaning of section 404.

I will later suggest a remedy.

Now, to address for a moment H.R. 3282, I am going to talk about just that part of H.R. 3282 that has to do with section 404.

By way of background, in 1980, over 10,000 section 404 permit applications were submitted and more than 8,000 permits were granted. The cumbersome review process was far too slow.

Overlapping agency jurisdiction—but more important, repetitive reviews of the same comments at each successive level of the Government hierarchy, starting with the district engineer and coming all the way to Washington were the causes of delay.

As a result, the average processing time for any controversial action was 271 days.

H.R. 3282 would amend section 404(b), making the guidelines regulatory in nature. This creates a great problem. This has the effect of establishing a presumption that a proposed discharge will be prohibited unless the guidelines are met.

We recognize that the guidelines should be and are followed, but if they are made regulatory, it opens up the review process to third party litigation.

We believe that adherence to the guidelines should be a matter for the executive branch to decide, not offer a fertile hunting ground for project opponents to find ways to transfer the decision to Federal court and, if nothing more, delay the project, hopefully to the point where the sponsor of the project would give up.

One of the goals of this administration has been to reduce paperwork and streamline Government procedures. What I am saying

now has to do with the question Mr. Stangeland asked the previous witness.

Assistant Army Secretary Giannelli was assigned the task of preparing a memorandum of agreement for the processing of applications for section 404 permits.

Significant accomplishments of Mr. Giannelli's rules included setting an objective of processing a permit in 60 days unless an environmental impact assessment was required.

Agencies were given specific time limits in which to respond to an application. Moreover, it had become customary to delay issuance of permits by reraising the same issues at the successive hierarchical levels of the Government but the memorandum of agreement limited the appeal process to only one reclama and that was at the Assistant Secretary level.

We believe there has been no demonstrated need to alter this memorandum of agreement, but H.R. 3282 would add 30 to 60 days to the normal processing time, raising that objective to 90 or 120 days from the present 60 days.

A 30-day delay would be imposed even when a permit was not opposed by anyone.

An additional automatic 30-day delay would be imposed by any agency commenting on the permit.

H.R. 3282 would also reinstate the repetitive reviews at successive agency levels. It is poor management to have more than one agency in charge of a program. Statutory imposition of automatic rights will, in our opinion, only serve to further confuse an already confused procedure.

H.R. 3282 also transfers final decisionmaking from the assistant department secretary level to the secretary. We do not believe that the public interest will be better served nor will the Secretary of the Army welcome this additional burden. Had I been asked the same question, Mr. Stangeland, I would have said if the procedure of processing which is now imposed by the Giannelli reforms, were adopted by the statute, I think that would be excellent.

If you are not already aware, those reforms are under attack in court also.

Now, for proposed changes to the Clean Water Act.

Rather than the proposed amendments of section 404 contained in H.R. 3282, beginning on line 13, page 15 and continuing through line 24, page 18, we would suggest three changes or clarifications.

With regard to section 404(b), make it clear that the guidelines developed under this section shall not be regulatory criteria but rather advisory guidance for the Secretary.

With regard to section 404(e)(1), authorize the Secretary to issue general permits for headwaters and isolated waters.

Third, section 404(e)(2), rather than automatically expiring at the end of 5 years, general permits should be subject to review at the end of 5 years.

Lastly and most importantly, I want to urge that Congress clarify the wetlands issue.

The Clean Water Act has been used to impose Federal control of land use on the individual property owners. Some of the partially or periodically inundated lands in this country are a national resource whose total destruction would be a national loss. The prob-

lem is to define or delimit wetlands in a way that the ordinary citizen can understand. Surely not every damp spot in the United States warrants Federal control.

Determination as to what constitutes a wetland is an uncertain process. I have cited the case in Louisiana. We know from experience that it varies from Corps of Engineering district to district. Different biologists have different decisions on wetlands. We know that some developers would want a definition that left them free of any control and I don't believe that is right.

We know some no-growth advocates and some ardent environmentalists would preserve every inch of land that could possibly be defined as a wetland. There has to be some happy medium in there.

Now, the Federal Government can bring enormous resources to bear in a disputed case and to some Federal agencies the amount of time and effort consumed on an application review is not a consideration.

Sometimes the owner is forced to give up what he believes to be right because he just can no longer contend with Federal forces ranged against him. So again I would say we respectfully urge that Congress clear up the ambiguity concerning wetlands. If development of wetlands is to be controlled, let them be defined, let them be demarcated by metes and bounds or on maps. Let the owners be reimbursed for taking of property rights or otherwise compensated when their use of the land is inhibited by Federal rulings.

The present situation is unsatisfactory, leaving decisions too much to junior Federal officials, thereby inviting the courts to take over the management of the permit process.

One final word, dredging and filling, construction operations, are not the only ways a wetland is destroyed or altered. Withholding water supplies, drainage resulting from actions taken at other locations, introduction of new plant species, either accidentally or by design, can change; grazing and just plain eutrophication or changes by nature, all these things can affect welands and do not involve a section 404 permit.

Mr. Chairman, thank you for this opportunity to express these views.

Mr. McNULTY. Mr. Rice, thank you.

Members of staff, have you questions for Mr. Hoge or Mr. Rice?

Well, we thank you for coming clear up here from Texas to talk about these things, and we are grateful for your testimony, the lucid way you presented it.

Mr. HOGE. Thank you very much.

Mr. RICE. Thank you.

Mr. McNULTY. Here is our friend from Minnesota. I don't know whether he might have questions.

Mr. STANGELAND. Thank you, Mr. Chairman, I have no questions.

I do want to join the chairman in commending you on some excellent testimony and thank you for coming and contributing to the hearing process as we move forward with this very important piece of legislation. I think your comments will be very helpful.

Mr. RICE. Thank you.

Mr. HOGE. Thank you, sir.

Mr. MCNULTY. From the American Association of Port Authorities, Alfred Hammon, chairman, AAPA Committee on Harbors and Navigation and supervisor of the Harbor Planning, Port Authority of New York and New Jersey. He is accompanied by Peter Gatti, his counsel. You two gentlemen are here. Mr. Hammon, good afternoon.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF ALFRED HAMMON, CHAIRMAN, HARBORS AND NAVIGATION COMMITTEE, THE AMERICAN ASSOCIATION OF PORT AUTHORITIES

Mr. Chairman and distinguished members of the Committee, my name is Alfred Hammon. I am appearing here today as Chairman of the Committee on Harbors and Navigation of the American Association of Port Authorities, a professional and trade association comprised of more than 130 public port agencies as corporate members and an additional 250 firms and individuals as contributing, associate, or honorary members. The Committee of which I serve as Chairman is responsible for responding to the increasing difficulties that have confronted AAPA member ports in the disposal of dredged material and for recommending needed legislative and regulatory changes in programs that affect port activities.

I would like to express AAPA's appreciation at the opportunity to testify here today in the consideration of H.R. 3282, the "Water Quality Renewal Act of 1983." This bill proposes water quality amendments and changes in the Sec. 404 program and other matters relating to dredged material that will have a direct effect upon ports and their navigation needs.

Our Nation's ports have a deep involvement in the 404 permit process. The maintenance of adequate water depths in the channels, berths and basins of this country's ports is critical to the proper and efficient operation of port facilities. In addition, the development of efficient modern port facilities on a continuing basis is necessary to maintain our national security, economic stability, and the appropriate import and export of commodities. The extent of this country's reliance upon ports is illustrated in the Summary Fact Sheet prepared by AAPA, a copy of which is attached to this statement.

Port dredging involves a continuing need to dispose of dredged material. The 90 public port agencies of the U. S. are faced with obtaining disposal permits on an almost continuing basis. Over the past five years, this experience has called attention to very fundamental aspects of the 404 program that have failed to meet the need of the U. S. port industry, and that therefore urgently require change. The regional, national, and international interests that depend upon port activities can be served only through a permit system that allows a full and fair consideration of dredging projects, and provides for expeditious decisions. This need, however, has generally not been met. To the contrary, ports have often found the 404 program to be characterized by delay in the processing of permits, uncertainty over the scope and meaning of the criteria and standards for evaluation, interagency disputes as to permit decisions, and disagreement (and litigation) as to how environmental concerns are to be brought together with this country's equally important economic, governmental, and defense needs.

In this testimony, the AAPA wishes to commend the Committee's recognition of a need for changes in the 404 program and to express support for a number of features in H.R. 3282. We also wish to identify other areas of the bill that are of concern and as to which the AAPA requests change. Our recommendations are not designed to interfere with the goal--shared by all of us--protecting our Nation's waters from unreasonable degradation. Port interests are not unresponsive to environmental concerns. The two can and must be accommodated in a fashion that takes realistic account of navigation needs that must go on. In our testimony, we have tried to present such an accommodation.

1. Sec. 6, amending Sec. 303(c),(2), pp. 7-9

AAPA supports the approach taken in proposed Sec. 303 (c) (2) (B) (p.7) of allowing States flexibility in revising water quality standards to allow less restrictive uses based upon realistic "attainability" limitations. The AAPA feels, however, that such flexibility should also apply where existing water quality standards were established on the basis of insufficient information regarding naturally-occurring parameter levels, requirements for environmental health, or where a change in designated uses is sought by a State for economic, governmental, commercial, social or other "public interest" reasons. This type of latitude is essential for the orderly planning of future growth and development.

AAPA is also concerned about the proposal in Sec. 303 (c) (2) (C) (pp.7-8) that, where water quality exceeds the levels necessary to support uses designated in an existing standard, upward revision of the standard is required to preserve the higher quality of the water. Where a designated use is being met, this additional water quality level should not be imposed upon a State without any consideration of social, economic, navigation, and commercial needs and consequences.

AAPA supports the principle expressed in new Sec. 303 (i) of allowing a state to modify water quality which exceeds the levels necessary to support propagation of fish, shellfish, wildlife and recreation "because of essential economic and social development for which there is no feasible alternative." However, AAPA would recommend substitution of the word "practicable" for the word "feasible" on p.9, line 4, as related to alternatives, to take account of the decision of the U. S. Supreme Court in American Textile Manufacturers Institute, Inc. v. Donovan, 452 U.S. 490, 509 (1981). There, the Court held that use of the word "feasible" in Sec. 6(b) (5) of the Occupational Safety and Health Act of 1970 meant "capable of being done", without consideration of costs and benefits. Use of the word "practicable" would also conform with the approach taken in regard to alternatives on p.15, line 20, in the proposed amendments to Sec. 404(b).

AAPA is also concerned about the provision in Sec. 303(i) (p.9, lines 5-7) that "(i)n no event, however, may degradation of water quality interfere with or become injurious to existing instream water uses". This would appear to largely negate the authority given the State to modify water quality standards for such waters. If existing instream water uses cannot to any extent be "interfered with" for overriding reasons, then the ability of a State to make meaningful choices as to future growth and development is seriously impaired.

From the standpoint of ports, it is essential that a mechanism be provided in Sec. 303 to allow change in the designated uses of a waterbody. Expansion of critically needed port facilities and the development of new channels will at times justify such a redesignation of uses (e.g., from propagation of fish and shellfish to navigation needs).

2. Sec. 9, adding new section 319 ("Estuaries")

AAPA has a number of concerns about proposed Sec. 319 relating to "Estuaries". The definitions of the terms "estuary" and "estuarine zone" in Sec. 319 (e) are unclear. If, on the one hand, they are limited to waters having a measureable salinity content (as provided in Sec. 104(n) (4) of the Clean Water Act), then Sec. 319 would apply to a very limited number of "estuaries", and it is difficult to discern the reason and need for the section. On the other hand, if extension of the term "estuarine zone" to include "the estuarine basin or estuarine watershed, consisting of the estuary and all tributaries that are within that basin of water" is in fact intended to include all fresh waters, it would include so many states that the program would be unworkable. If there are existing needs for this type of management in specific areas, they should be identified and disclosed to allow an informed evaluation of and comment upon the proposed new section.

Section 319 is also unclear as to the extent of the requirement for development of a "comprehensive master plan". There are often practical and political disagreements between states, and differences in state goals and policies, that may present very real difficulties in achieving final development of such a master plan. Such difficulties, however, should not be allowed to interfere with, impede, or otherwise adversely effect the continued conduct of needed port improvements and operations, such as channel improvements and landside terminal facilities.

Section 319 also does not take port concerns and needs into account in its proposal for development of a master plan. The emphasis is upon "... the attainment or maintenance of that water quality in an estuary which assures protection of public water supplies and the protection and propogation

20-955 O—84——115

of a balanced, indigenous population of shellfish, fish, and wildlife, and allows recreational activities, in and on the water,...". No consideration is given to navigation needs and other port uses of these waters. Indeed, the listed fish, wildlife, and recreational uses might be construed (or asserted) to preclude new port operations.

Given that estuaries frequently sustain port activities, we believe that any true "comprehensive master plan" must also consider economic, commercial, navigation, or trade needs. The failure to consider such port-related concerns has been a fundamental problem with "standard-setting" in the past. It has often resulted in unrealistic and one-sided standards that fail to take into account important elements of the total "public interest" that should have been considered.

3. Sec. 10, amending Sec. 404(b), p.15

AAPA has serious concerns with new language proposed in Sec. 404 (b) (1) (B). It creates a presumption that all discharges of dredged material are unacceptable and must be prohibited, and requires that this presumption be "disproved" in the permit process. In the view of AAPA, discharges of dredged material associated with navigation needs should be presumptively allowed unless a finding ismade that the discharge will have an unacceptable adverse effect. This determination should include a consideration of all factors affecting the public interest--either by inclusion of such factors in the 404(b) (1) Guidelines, or by separate public interest review.

Under the proposed language, even if there will be no unacceptable adverse effects from the discharge, a permit applicant must still show that there is no practicable alternative which will have less adverse effect on the aquatic environment, and will not have other significant adverse environmental

consequences. AAPA feels that this further showing is unnecessary and inappropriate. The consideration of alternatives should not be required where a discharge will not have an unacceptable adverse effect. In that event, the discharge should be allowed. It is in cases where adverse effects would be produced that consideration of alternatives becomes crucial. This consideration becomes a fundamental part of the determination of "acceptability" of the discharge from the standpoint of the overall public interest. In that determination there should be no bias against the acquatic environment as a disposal medium. The recent scientific evidence and experience indicates equal consideration should be given to all disposal options.

4. Sec. 10, amending Sec. 404(q), pp. 16-18

AAPA supports a number of the changes proposed in the amendment to Sec. 404 (q). The general tightening of the time limits for "comment" by other Federal agencies, and for "elevation" of a disputed decision to issue the permit, has been long overdue. AAPA would, however, urge the Committee to make certain modifications in the proposed language.

(a) The language should clarify that the interagency notice required to be given by the District Engineer (p. 16, line 7-10) of the filing of a permit application must be within the fifteen (15) day period specified in Sec. 404 (a) for issuance of public notice. Any further delay in the giving of such notice would unnecessarily extend the time for permit review, decision, and coordination.

(b) The reference to "the heads of other appropriate Federal agencies" (p. 16, lines 9-10) is vague and could lead to disputes as to what other Federal agencies are "appropriate". The other agencies should either be

specified, or their appropriateness should be determined by the Secretary of the Army.

(c) Other agencies should not have a right to an automatic extension of the comment period for an additional period of thirty (30) days (p. 16, lines 13-15). The right to the extension should be allowed only for "just cause".

(d) The AAPA is concerned about the requirement (p. 16, line 20 and p. 18, line 10) that the District Engineer and Division Engineer give "full consideration" to the comments of other Federal agencies. This implies that greater consideration will be given to these comments than to other relevant factors in the permit process. AAPA would recommend that this provision be deleted, or else that the phrase "along with all other relevant factors and information" be added to these two sections to make clear that "full consideration" is to be given to all pertinent information.

(e) The Administrator, the Secretary of the Interior, and the Secretary of Commerce should not have an automatic right of "elevation of a dispute" simply "upon request" (p. 17, lines 24-25 and p. 18, lines 1-4). The right to request elevation should be allowed only for narrowly defined reasons, such as for insufficient interagency coordination at the district level, development of significant new information not previously available or the need to resolve environmental issues of national importance requiring policy level review. These are limitations contained in the current Memoranda of Understanding executed between the Secretary of the Army and the heads of these other Federal agencies, and they reflect the recommendations of the Presidential Task Force on Regulatory Relief for simplifying the 404 permit process. We believe these limitations should be continued.

* * *

This concludes the AAPA testimony upon H.R. 3282. We have tried to offer constructive suggestions for changes that the ports of this country feel are clearly needed. We do not comment from the standpoint of an idle observer. Ports are involved day-in and day-out with the 404 permit process. Our appreciation of its shortcomings is based upon direct experience.

In an effort to offer a sense of direction to the basic structure of the 404 permit program, AAPA has prepared a more comprehensive statement of principles that was contained in a letter to Senator John Chafee. We strongly feel these principles should guide and govern any amendments to Sec. 404. A copy of this letter (yellow insert) is attached to my testimony for inclusion in the Hearing Record. These principles entail no sacrifice of environmental protection; but they would achieve a more manageable, workable, and balanced regulatory program. We ask that they be reviewed and carefully considered by the members of the Committee in these Clean Water Act hearings.

Thank you.

THE AMERICAN ASSOCIATION OF PORT AUTHORITIES

SUMMARY FACT SHEET

U.S. SEAPORT INDUSTRY--STRUCTURE

-- 189 deepwater ports on the Atlantic, Gulf, and Pacific coasts and the Great Lakes capable of handling vessels with drafts of 14 feet or more.

-- 1,456 marine terminals including 2,939 ship berthing facilities. Approximately 51 percent are publicly-owned by state and local government entities and 51 percent are privately-owned.

-- Actual cash value and estimated replacement cost of all marine facilities in the U.S. is $40.4 billion and $54 billion respectively (in 1977 dollars).

-- Total facility investment by public port authorities of $4.86 billion, in the period 1946-1978, including $1.6 billion for 1973-1978.

-- Projected port capital expenditures for 1980-1990 will be in excess of $5 billion.

-- An industry that is overwhelmingly the product of local and private initiative and investment.

U.S. SEAPORT INDUSTRY--ECONOMIC IMPACT

-- In 1980, U.S. ports accounted for:

- more than one million jobs
- $86 billion in gross sales within the nation
- $35 billion of Gross National Product
- $23 billion in personal income
- $7.9 billion in business income
- $5.0 billion in state and local taxes
- $10 billion in federal tax and customs revenues

-- The value of foreign trade equates to more than 20 percent of the value of the U.S. Gross National Product.

-- Oceangoing vessels carry more than 95 percent of the tonnage in

U.S. overseas foreign trade, all of which moves through seaports by necessity.

-- U.S. waterborne foreign commerce in 1981 totaled 886.3 million short tons valued at $318.8 billion.

-- U.S. seaports provide essential services to the nation's transportation system.

U.S. SEAPORT INDUSTRY--THE NATIONAL INTEREST

-- Provides the necessary transportation infrastructure to transfer cargo and passengers efficiently between ship and shore.

-- Facilitates movement of U.S. exports and thus helps the nation's balance of payments.

-- Provides means of entry for imports of strategic materials essential to national security - petroleum, metallic ores, etc.

-- Maintains facilities needed for the deployment of U.S. military forces and for the reinforcement and support of U.S. allies in time of war or international emergency.

THE ROLE OF GOVERNMENT

STATE AND LOCAL GOVERNMENT

-- Public port agencies are established, administered, and operated under state and local laws.

-- Public port agencies are generally self-supporting, with revenues coming from user fees, property rentals, etc.

-- Public port agencies act as local sponsors for navigation projects undertaken by federal government.

FEDERAL GOVERNMENT

-- Historically has provided anchorages, harbors, main shipping channels, navigation aids, harborworks (such as breakwaters).

-- U.S. Army Corps of Engineers and U.S. Coast Guard have been traditionally involved in port matters, with the Corps' involvement dating from 1824.

-- The policy of non-discrimination between ports is rooted in the U.S. Constitution and various shipping acts.

-- Federal investment in deepwater navigation projects is a fraction

of federal customs and vessel tax receipts collected from commerce generated by the ports. Fiscal year 1981 collections at U.S. seaports amounted to $5.6 billion from customs duties and $14 million from vessel tonnage fees contrast with total expenditures by the Coast Guard and Army Corps of Engineers for navigation projects of some $700 million.

-- Federal investment in deepdraft navigation from 1824 through FY 1979 amounted to around $4.4 billion; investment in port facilities by non-federal entities amounted to at least $5 billion for the 1946-1980 period.

THE COSTS OF SEAPORT OPERATION

-- Seaports are largely dependent on revenues generated by operations and to a lesser extent, on state and local tax monies.

-- Many are required to be financially self-supporting under state law.

-- Most seaports have only marginal returns, ranging from +2 to -2 percent.

-- Inflation has significantly raised the cost of land, equipment, construction, fuel, and all other aspects of marine terminal expansion and operation. The high cost of capital also affects the ability of ports to provide new or expanded facilities.

-- Compliance with federal health, safety, security and environmental protection has added significantly to the burden of public port costs - $194 million in the period 1970-1976 alone.

-- Excessive delays in the processing of federal permits needed to proceed with essential terminal and navigation projects mean even higher costs, economic losses, and actually threaten to shut down some U.S. ports.

Senator John H. Chafee, Chairman
Subcommittee on Environmental Pollution
61 Capitol Hill Apartments
128 "C" Street, N.E.
Washington, DC 20510

Dear Mr. Chairman:

In connection with the Subcommittee hearings on reauthorization of the Clean Water Act (33 USC §§ 1251 et. seq.), the American Association of Port Authorities (AAPA) urges the Subcommittee to consider fundamental changes that are urgently needed in Section 404 (33 USC §1344) and that are, from the standpoint of ports, long overdue.

This nation's ports have a deep involvement in the 404 permit process. The maintenance of adequate water depths in the channels, berths and basins of this country's ports is critical to the proper and efficient operation of port facilities. In addition, the development of efficient modern port facilities on a continuing basis is necessary to maintain our national security, economic stability, and the appropriate import and export of commodities. The extent of this country's reliance upon port operations is perhaps best illustrated in the Summary Fact Sheet prepared by AAPA, a copy of which is attached.

These port operations involve a continuing need to discharge dredged material in our nation's waters. The 90 public port agencies of the U.S. face the challenges of obtaining Section 404 permits on an almost continuing basis. The experiences of these AAPA members with the 404 permit program have been fraught with difficulty and are characterized by unnecessary delays, increased project costs, worsening bureaucratic red tape, endless disagreements among federal agencies who "comment" upon 404 permit applications, and needless expenditures which bear little relation to the goal of environmental protection. These concerns require legislative action to correct effects which, AAPA believes, were never intended by Congress in its passage of Section 404. The administrative process has simply not proven adequate to correct its own abuses. It is time for the Congress to speak directly to port concerns.

In this letter, AAPA presents a statement of principles that

represents the basis for the changes which we believe are necessary.

Statement of Principles

- Section 404, as presently worded, does not specify the "standard" upon which permit decisions are to be made. In practice, decisions have been based upon confusing and often conflicting applications of the Corps of Engineers "public interest review" and the EPA 404(b)(1) Guidelines. This uncertainty must be removed. Section 404 should be amended (i) to specify "unreasonable degradation" as the "standard" to be applied (i.e., a 404 permit will not be issued if it would result in "unreasonable degradation" of "waters of the United States"), and (ii) to provide that this determination is to be based upon a "balancing" of all factors affecting the "public interest"--not just certain concerns (such as environmental or economic) to the exclusion of others.

- Section 404 should specify the relationship between the Section 404(b)(1) "guidelines" and the "standard" for permit decision. AAPA supports the view that the guidelines should not be "binding" compliance requirements, but "guidelines" to be considered with other relevant factors in determining whether "unreasonable degradation" will occur. If the "guidelines" are to be binding, they should not be restricted to environmental concerns alone, but should include appropriate consideration of other relevant factors in determining the question of "unreasonable degradation."

- The special recognition of port concerns in Section 404(b)(2)--i.e., "economic impact of the site on navigation and anchorage," which includes defense, employment world trade and tax revenues--should be retained to assure full and adequate consideration of the major national, regional, state, and local interests which ports serve.

- Consideration of "alternatives" (i.e., other means or methods of disposal) should be required only in those cases where a proposed discharge has a potential for causing significant adverse effects. If the discharge is essentially innocuous, there should be no rote insistence upon consideration of "alternatives."

- The Section 404(c) "veto" authority of the Administrator should be related to the standard of "unreasonable degradation" (including the consideration of all factors affecting the "public interest") i.e., a "veto" should be authorized only where the Administrator finds that the specified environmental concerns "outweigh" other factors relating to

the public interest and will result in "unreasonable degradation."

- Provision should be made for the issuance of permits for recurring maintenance dredging activities for a period of up to 10 years--either in connection with the individual permit process, or as general permits. Moreover, permit periods for construction activities should reflect time rather than arbitrary and possibly disruptive time limits. The Secretary can assure sufficient review and supervision of such activities by including appropriate monitoring and reporting requirements as conditions to the permit.

- The "general permit" procedure of Section 404(e) should be amended to specifically authorize "general permits" (i) for geographic areas, (ii) for categories of activities which, while not necessarily "similar," are appropriate for authorization by general permit, and (iii) as a means of avoiding duplication of effort and reducing unnecessary bureaucratic red tape. The Secretary can maintain adequate supervision and control over activities covered by such general permits through establishment of appropriate advance notification or reporting requirements.

- Expansion (or clarification) of Section 404(f)(1)(B) exemption from permit requirements to include shoreside structures such as piers, docks, wharves, and marine terminals.

- Section 404(q) should require that final decision be made upon a Section 404 permit application to the maximum extent practicable within 60 days, and in no event later than 90 days from the date of the Public Notice, with provision for only a single extension of time, not to exceed 30 days, when the Secretary finds "just cause" for the extension.

- Section 404(m) should specify that the right and opportunity of other federal agencies to comment upon 404 permit applications is subject to the time specified for <u>final</u> permit decision. Section 404(m) and (q) should further provide that "comments" upon 404 permit applications must be based upon "criteria" and "standards" established by the commenting agency that implement clearly defined statutory authority and are not inconsistent with the 404 program.

- Where "comments" upon 404 permit applications include recommendations for <u>affirmative action</u> to be undertaken by a permittee (<u>e.g.</u>, mitigation, compensation, or enhancement), the recommending agency should be required to show that the

action (i) will achieve significant benefits for resources within the statutory authority of the commenting agency, (ii) is reasonably available to the applicant, and (iii) under the circumstances is feasible and practicable.

- Other federal agencies should have no "right" to force referral of "unresolved" objections to the permit to higher levels of the agencies involved. Only the Corps of Engineers, as the permitting authority, should have the "option" to seek referral or to grant the permit.

- Specific provision should be made to confirm that the final permit authority under Section 404 remains with the Corps of Engineers, limited only by the EPA's Section 404(c) "veto" authority.

We urge the Subcommittee to expand its examination of the Clean Water act to include a review of the present Section 404 permit program. We pledge to you any assistance that you may require in addressing this most important area of concern to our nation's ports.

Sincerely,

J. Ron Brinson

Alfred Hammon

Alfred Hammon
Chairman, AAPA Committee
on Harbors and Navigation

Mr. McNULTY. Please proceed.

TESTIMONY OF ALFRED HAMMON, CHAIRMAN, AAPA COMMITTEE ON HARBORS AND NAVIGATION AND SUPERVISOR, HARBOR PLANNING, PORT AUTHORITY OF NEW YORK AND NEW JERSEY, ACCOMPANIED BY PETER GATTI, COUNSEL FOR GOVERNMENT RELATIONS

Mr. HAMMON. Good afternoon, Mr. Chairman.

Mr. McNULTY. The floor is yours.

Mr. HAMMON. Thank you, sir.

Mr. Chairman, and distinguished members of the subcommittee, my name is Alfred Hammon. I am appearing here today as chairman of the Committee on Harbors and Navigation of the American Association of Port Authorities.

With your permission, I would like to omit certain elements of my statement with the request that they appear in the full transcript as part of the record.

Mr. McNULTY. It has been made a part of the record.

Mr. HAMMON. Thank you.

I would like to express AAPA's appreciation at the opportunity to testify here today in the consideration of H.R. 3282, the "Water Quality Renewal Act of 1983." This bill proposes water quality amendments and changes in the section 404 program and other matters relating to dredged material that will have a direct effect upon ports and their navigation needs.

In this testimony, the AAPA wishes to comment the subcommittee's recognition of the need for changes in the 404 program and to express support for a number of features in H.R. 3282. We also wish to identify other sections of the bill that are of concern and as to why AAPA requests change.

The AAPA supports the approach taken in proposed section 303(c)(2)(B), page 7, of allowing States flexibility in revising water quality standards to allow less restrictive uses based upon realistic attainability limitations. The AAPA feels, however, that such flexibility should also apply where existing water quality standards were established on the basis of insufficient information regarding naturally occurring parameter levels, requirements for environmental health, or where a change in designated uses is sought by a State for economic, governmental, commercial, social or other "public interest" reasons. This type of latitude is essential for the orderly planning of future growth and development.

AAPA is also concerned about the proposal in section 303(c)(2)(C), pages 7 and 8, that, where water quality exceeds the levels necessary to support uses designated in an existing standard, upward revision of the standard is required to preserve the higher quality of the water. Where a designated use is being met, this additional water quality level should not be imposed upon a State without any consideration of social, economic, navigation, and commercial needs and consequences.

AAPA supports the principle expressed in new section 303(i) of allowing a State to modify water quality which exceeds the levels necessary to support propagation of fish, shellfish, wildlife, and recreation "because of essential economic and social development for

which there is no feasible alternative." However, AAPA would recommend substitution of the word "practicable" for the word "feasible" on page 9, line 4, as related to alternatives, to take account of the decision of the U.S. Supreme Court in *American Textile Manufacturers Institute, Inc.* v. *Donovan*, 452 U.S. 490, 509 (1981). There, the Court held the use of the word "feasible" in section 6(b)(5) of the Occupational Safety and Health Act of 1970 meant "capable of being done," without consideration of costs and benefits. Use of the word "practicable" would also conform with the approach taken in regard to alternatives on page 15, line 20, in the proposed amendments to section 404(b).

AAPA is also concerned about the provision in section 303(i) that "(i)n no event, however, may degradation of water quality interfere with or become injurious to existing instream water uses." This would appear to largely negate the authority given the State to modify water quality standards for such waters. If existing instream water uses cannot to any extent be "interfered with" for overriding reasons, then the ability of a State to make meaningful choices as to future growth and development is seriously impaired.

AAPA has a number of concerns about proposed section 319 relating to "Estuaries." The definitions of the terms "estuary" and "estuarine zone" in section 319(e) are unclear. If, on the one hand, they are limited to waters having a measurable salinity content, as provided in section 104(n)(4) of the Clean Water Act, then section 319 would appear to apply to a very limited number of "estuaries," and it is difficult to discern the reason and need for the section. On the other hand, if extension of the term "estuarine zone" to include "the estuarine basin or estuarine watershed, consisting of the estuary and all tributaries that are within that basin of water" is in fact intended to include all fresh waters, it would include so many States that the program would be unworkable. If there are existing needs for this type of management in specific areas, they should be identified and disclosed to allow an informed evaluation of and comment upon the proposed new section.

Section 319 is also unclear as to the extent of the requirement for development of a "comprehensive master plan." There are often practical and political disagreements between States and differences in State goals and policies that may present very real difficulties in achieving final development of such a master plan. Such difficulties, however, should not be allowed to interfere with, impede or otherwise adversely effect the continued conduct of needed port improvements and operations, such as channel improvements and landside terminal facilities.

Section 319 also does not take port concerns and needs into account in its proposal for development of a master plan. The emphasis is upon "* * * the attainment or maintenance of that water quality in an estuary which assures protection of public water supplies and the protection and propogation of a balanced, indigenous population of shellfish, fish, and wildlife, and allows recreational activities, in and on the water, * * * ." No consideration is given to navigation needs and other port uses of these waters. Indeed, the listed fish, wildlife and recreational uses might be construed, or asserted, to preclude new port operations.

Given that estuaries frequently sustain port activities, we believe that any true "comprehensive master plan" must also consider economic, commercial, navigation, or trade needs. The failure to consider such port-related concerns has been a fundamental problem with "standard-setting" in the past. It has often resulted in unrealistic and one-sided standards that fail to take into account important elements of the total "public interest" that should have been considered.

AAPA has serious concerns with new language proposed in section 404(b)(1)(B). It creates a presumption that all discharges of dredged material are unacceptable and must be prohibited and requires that this presumption be "disproved" in the permit process. In the view of AAPA, discharges of dredged material associated with navigation needs should be presumptively allowed unless a finding is made that the discharge will have an unacceptable adverse effect. This determination should include a consideration of all factors affecting the public interest, either by inclusion of such factors in the 404(b)(1) guidelines, or by separate pubic interest review.

Under the proposed language, even if there will be no unacceptable adverse effects from the discharge, a permit applicant must still show that there is no practicable alternative which will have less adverse effect on the aquatic environment and will not have other significant adverse environmental consequences. AAPA feels that this further showing is unnecessary and inappropriate. The consideration of alternatives should not be required where a discharge will not have an unacceptable adverse effect. In that event, the discharge should be allowed. It is in cases where adverse effects would be produced that consideration of alternatives becomes crucial. The consideration becomes a fundamental part of the determination of acceptability of the discharge from the standpoint of the overall public interest. In that determination there should be no bias against the aquatic environment as a disposal medium. The recent scientific evidence and experience indicates equal consideration should be given to all disposal options.

AAPA supports a number of the changes proposed in the amendment to section 404(q). The general tightening of the time limits for comment by other Federal agencies and for elevation of a disputed decision to issue the permit, has been long overdue. AAPA would, however, urge the committee to make certain modifications in the proposed language.

First, the language should clarify that the interagency notice required to be given by the district engineer of the filing of a permit application must be within the 15-day period specified in section 404(a) for issuance of the public notice. Any further delay in the giving of such notice would unnecessarily extend the time for permit review, decision and coordination.

Second, the reference to "the heads of other appropriate Federal agencies" is vague and could lead to disputes as to what other Federal agencies are appropriate. The other agencies should either be specified, or their apropriateness should be determined by the Secretary of the Army.

Third, other agencies should not have a right to an automatic extension of the comment period for an additional period of 30 days. The right to the extension should be allowed only for just cause.

Fourth, the AAPA is concerned about the requirement, page 16, line 20 and page 18, line 10, that the district engineer and division engineer give full consideration to the comments of other Federal agencies. This implies that greater consideration will be given to these comments than to other relevant factors in the permit process. AAPA would recommend that this provision be deleted, or else that the phrase "along with all other relevant factors and information" be added to these two sections to make clear that full consideration is to be given to all pertinent information.

Fifth, the Administrator, the Secretary of the Interior, and the Secretary of Commerce should not have an automatic right of elevation of a dispute simply upon request. The right to request elevation should be allowed only for narrowly defined reasons, such as for insufficient interagency coordination at the district level, development of significant new information not previously available, or the need to resolve environmental issues of national importance requiring policy level review.

These are limitations contained in the current memorandums of understanding executed between the Secretary of the Army and the heads of these other Federal agencies, and they reflect the recommendations of the Presidential Task Force on Regulatory Relief for simplifying the 404 permit process. We believe these limitations should be continued.

This concludes the AAPA testimony on H.R. 3282. We have tried to offer constructive suggestions for changes that the ports of this country feel are clearly needed. We do not comment from the standpoint of an idle observer. Ports are involved day in and day out with the 404 permit process. Our appreciation of its shortcomings is based upon direct experience.

In an effort to offer a sense of direction to the basic structure of the 404 permit program, AAPA has prepared a more comprehensive statement of principles that was contained in a letter to Senator John Chafee dated April 18, 1983. We strongly feel these principles should guide and govern any amendments to section 404.

A copy of this letter is attached to my testimony for inclusion in the hearing record. These principles entail no sacrifice of environmental protection, but they would achieve a more manageable, workable, and balanced regulatory program. We ask that they be reviewed and carefully considered by the members of the committee in these Clean Water Act hearings.

Thank you.

Mr. McNulty. Thank you, Mr. Hammon.

Had you proposed to testify, Mr. Gatti?

Mr. Gatti. No, I had not.

Mr. McNulty. On page 2 of your testimony, Mr. Hammon, talking about section 303(c)(2)(C), you said that where the water quality exceeds the levels necessary to support use and designating an existing standard that there should not be an upward revision of the standard to preserve the high quality of water. Why not?

Mr. Hammon. You are referring to the bottom of the page, sir?

Mr. McNulty. At the bottom of the page.

Mr. HAMMON. What we are saying is that upgrading should not occur unless there is also consideration of social, economic, and commercial navigational needs. There are instances where it might be appropriate to upgrade, and there might be instances where these other factors should be considered in a decision for such upward revision.

We would not be opposed, per se, to the upward revision. We would simply ask that these other factors be considered in such a step.

Mr. MCNULTY. You are suggesting, then, there might be social, economic, navigational, or commercial needs of a nature that would make it appropriate that the quality of the water be somewhat reduced?

Mr. HAMMON. It could be, sir. For example, in a harbor where elevation of the quality of water to say, recreational swimming levels, was comtemplated, the commerce of the harbor could be impacted. This might be a situation where, you certainly would want to consider those factors in deciding upon the wisdom of elevation.

Mr. MCNULTY. Mr. Stangeland?

Mr. STANGELAND. Thank you, Mr. Chairman.

In your discussion of water quality standards, you mentioned the need to provide a mechanism in 303 to allow change in the designated uses of a water body. If the existing law and regulations were left in place, are they adequate to address your concerns?

Mr. HAMMON. If the existing mechanism——

Mr. STANGELAND. Existing law and regulations were left in place.

Mr. HAMMON. No. As a matter of fact, I think we are quite pleased that the bill does have some mechanisms for change. We are only emphasizing the fact that the bill should include full consideration of social, commercial, economic, and navigational factors in deciding such change.

For example, in Section 303(c)(2)(B)(iii), a less restrictive water quality standard requires "substantial and widespread adverse economic and social impact." This suggests a need for nearly catastrophic circumstances. There are significant adverse impacts to justify revisions below such a level that warrant consideration.

Mr. STANGELAND. So you would like to see some changes in section 303 then.

Mr. HAMMON. Yes.

Mr. STANGELAND. But perhaps not to the extent the legislation addresses?

Mr. HAMMON. One of our standing concerns here and in previous testimony has been a need for more consideration of economic commerce, trade, and navigation factors in the matter of aquatic disposal of dredged materials as these affect the total public interest.

Mr. STANGELAND. On page 5 you express concern about the definitions of the term "estuary" and "estuarine zone" and that estuarine zone would concern me as well because Bemidji would be an estuarine zone to New Orleans and the Gulf of Mexico.

Mr. HAMMON. Chicago might also?

Mr. STANGELAND. Well, yes, I think it would be.

Mr. HAMMON. That has been the concern expressed by some of our members.

20-955 O—84——116

Mr. STANGELAND. If the definition was limited to waters of a certain salinity, would that limit the concern of AAPA?

Mr. HAMMON. It would certainly narrow the geographic scope. At least it would confine participation in comprehensive master planning to those States that generally are adjacent to the harbor and port area, and thus would hopefully have a more direct concern with the outcome of the plan.

What would be of great concern could be "way up-river" interests far removed from the port and harbor benefits of the plan in contrast to the surrounding States.

Mr. STANGELAND. If there were no legislative changes in section 404 of the act, what is AAPA's views of that provision and existing regulations?

Mr. HAMMON. We have a series of problems, some of which have already been covered in this statement. Perhaps I could quickly go over some of them.

One is that we would like to see more use of general permits, especially for maintenance dredging. We also continue to be concerned over the possible timing and scope of comments of the various other agencies on permit applications, comments which may not always be pertinent or within agency mandates.

The elevation of permit disputes needs careful discipline to avoid undesirable delays. Disposal alternatives should be explored only when aquatic disposal would result in unreasonable degradation of the marine environment..

Extensions for additional review time should be limited to just cause. We also believe that longer permit periods could be allowed in certain instances. A more balanced approach between consideration of environmental and economic factors in the issuance of dredged material disposal permits if also needed. Some of these are expressed, in the AAPA statement of principles that has been appended to this statement.

Mr. STANGELAND. OK.

Mr. HAMMON. They will be made available for you.

Mr. STANGELAND. Very good. Thank you.

Mr. MCNULTY. Mr. Hammon, Mr. Gatti, thank you for your testimony here this afternoon.

Mr. GATTI. Thank you.

Mr. HAMMON. Thank you, Mr. Chairman.

Mr. MCNULTY. Kenneth Spear and Frank Browne are the next two witnesses, but I am sorry to say that the two lights on the clock—are you Mr. Spear—have told us that we must cast a record vote. We have got about 9 minutes to do that.

If you and Mr. Browne would not mind staying here, I think Mr. Stangeland and I can be back here in 15 minutes or less. We apologize for the delay.

[Recess.]

Mr. MCNULTY. Well, our much-recessed meeting will reconvene. We will begin with you, Kenneth Spear, from Infilco-Degremont, Richmond, Va. We are sorry for the many delays today and are grateful for the many hours that you have been here. The floor is now yours.

TESTIMONY OF KENNETH SPEAR, INFILCO DEGREMONT, RICHMOND, VA., ON BEHALF OF WATER & WASTEWATER EQUIPMENT MANUFACTURERS ASSOCIATION, INC.

Mr. SPEAR. Thank you, Mr. Chairman.

Mr. Chairman and members of the subcommittee, my name is Ken Spear of Infilco Degremont. I currently serve as a board member of the Water & Wastewater Equipment Manufacturers Association, Inc. [WWEMA]. I am very pleased to have the opportunity to offer the association's view about the state of America's clean water program. We recognize and appreciate the role of your committee and its excellent staff in shaping the important water pollution control policies of this country.

WWEMA is an association comprised of major corporations that develop technology, manufacture and supply equipment, materials and services in the water and wastewater industry. At the outset, we wish to emphasize that our organization carries a very positive attitude about the accomplishments of the clean water program and, in contrast to what the subcommittee may have heard from other sources, we remain optimistic about the opportunities that lie ahead.

This is not to say that we are unaware of the complexities and ambiguities of problems that have plagued the national effort to improve water quality. WWEMA is pleased, therefore, to be able to share the following views and comments with you.

In 1982 WWEMA submitted its recommendations concerning amendments to the Clean Water Act. We are providing for the record our full statement on our position on select sections of the Clean Water Act (attachment A). However, at this time WWEMA would like to voice its very strong opposition to EPA's proposed water quality standards.

First and foremost is the fact that the pre-1972 water quality approach was ineffective at reducing water pollution. Congress recognized this frailty and in its wisdom changed from "water quality" to "limits on pollutant" parameters, subsequently embodied in the Clean Water Act of 1972. Decidedly, the Federal Government superseded the State's role in setting, implementing, and enforcing water pollution controls in order to provide nationwide uniformity. Do we wish to return to "pollution shopping" where industry can measure the economic feasibility of plant location predicated on State standards?

The underlying principle of a water quality-based program is that the environment exists to receive waste, rather than the more reasonable approach of how to avoid release of waste. More importantly, the proposed changes are unnecessary. The current regulations governing State water quality standards strike a reasonable balance between protection and flexibility—insuring good water, while allowing States the freedom to make exceptions in those rate cases where the attainment of environmental goals would cause substantial economic hardship.

The proposed water quality standards would undermine this Nation's water pollution control efforts by allowing and encouraging States to weaken their water quality standards and would make economically hard-pressed States vulnerable to pressures from pol-

luting industries. Existing regulations have the flexibility necessary to make any exceptions needed in water quality standards without exposing the States to pressure from industry. In fact, since 1974 fewer than a dozen changes in State water quality standards were disapproved by EPA.

WWEMA believes that the proposed changes should be deferred for several years. Priority should be shifted to organizing a nationwide water quality monitoring program that will provide an accurate account of water quality levels for all bodies of water. Then, and only then, can informed judgments be made possible.

Finally, since States can only downgrade designated uses if they have not yet been attained, these proposals reward States and firms that have done a poor job of cleaning their waters by allowing and encouraging them to easily downgrade designated uses. Downgrading designated uses of water bodies will certainly increase the cost to process drinking water from the same source. States that have done a good job of setting and meeting water quality goals will not be able to downgrade.

According to recent polls, the American people are firmly in favor of a strong and continued water pollution control effort. If such drastic changes in the clean water program are to be made, we feel that the EPA should let them come from the Congress. One other area WWEMA strongly supports is the increased authorization level for the EDPA's construction grants program, as found in Representative James Howard's bill, H.R. 3283, calling for an authorization level of $4 billion for fiscal year 1984, $4.5 billion in 1985, and $5 billion for fiscal years 1986–88.

Mr. Chairman, in addition, I would like to express WWEMA's support for remarks that Mr. Goldman made previously concerning private construction and ownership of treatment plants. We feel that that is an issue that we also can support.

Thank you for allowing us to comment on this important subject. We feel confident that your committee will again provide sufficient oversight to make only the necessary adjustments and corrections to the act maintaining consistent scope and continued momentum toward achieving its environmental goals.

Mr. McNULTY. Mr. Stangeland?

Mr. STANGELAND. Thank you, Mr. Chairman.

Just to touch quickly on downgrading, are you saying that we ought to not allow downgrading?

Mr. SPEAR. Yes, sir.

Mr. STANGELAND. Isn't there a possibility that that can be counterproductive? I will just put it this way. We have got a Federal standard set and established, and the State sets its standard equal to or higher. If we don't allow any adjustment, don't we tend to have the State only set the minimum Federal standard, and not try to achieve the higher standard?

And if we allow them to adjust, and we had testimony yesterday where a State had set substantially higher standards at a time when there really wasn't a state of the art, they just kind of set up theirs real high, and the companies had made their best effort to achieve. They didn't achieve the State standards, but they were far superior to the Federal, and all they asked a State was to bring your designated use and standard down to where we are.

The State agreed to do that, and doesn't that encourage States to set a higher standard, to shoot for a goal, but if that goal isn't attainable in a cost-benefit fashion, then they can come down, just so long as they are superior to the Federal standard?

Mr. SPEAR. I believe, sir, that we are primarily interested in seeing that uniform standards be applied throughout the country, that industry is not allowed to go "pollution shopping," if you will. If a State chooses or has chosen to set some higher standards, then I think that it might be that they might be allowed to downgrade those, but as long as they maintain the Federal standard.

Mr. STANGELAND. Oh, yes. When we speak of downgrading, I think we are not talking about downgrading the Federal standards, unless, of course, those Federal standards have been set at a level that are just unattainable.

In your statement you support creation of a nationwide water quality monitoring program. Will you expand on your concept for this program and provide the committee information on cost scope and length of such a program that you believe is needed?

Mr. SPEAR. Yes, sir, we would be glad to. Very briefly, there is technology available to monitor the water quality of rivers and streams, and there is also the technology to do a computer mathematical modeling, that based on the data would allow a prediction of the effect on a river or stream from adding additional pollution. We feel that before the pollution is added, if we are going to go to water quality standards, that we need that data, and we would be glad to expand on that further.

Mr. STANGELAND. I gather that WWEMA is interested in maximizing the dollars available for the largest volume of construction that we can get on line and get going out there. Do you have any feelings for privatization, or any feeling for switching from the construction grants program to a loan program?

Mr. SPEAR. We would support a loan program, and the privatization, sir. We are interested in seeing that the program moves ahead as rapidly as possible, that the waters of this country are cleaned up as rapidly as possible, and if some other method other than a grant program can be used we are very much in favor of it. We are very much in favor of the privatization.

Mr. STANGELAND. Thank you, Mr. Spear. Thank you, Mr. Chairman.

Mr. MCNULTY. Mr. Daub.

Mr. DAUB. My ranking member asked my questions. I would just be clear in my own mind. You are saying essentially the rules and regulations currently in existence are adequate and reasonable and no change needs to be made?

Mr. SPEAR. Yes, sir.

Mr. DAUB. Thank you.

Mr. MCNULTY. Mr. Spear, staff has suggested to me that the standards to which you are objecting are last year's version, and that the stuff that is in the mill now may be a good deal more stringent. I think those are going to be along very shortly, and I commend them to your consideration. I would appreciate your views on this new draft, when it is known to you.

Mr. SPEAR. I would be glad to, sir. Thank you.

Mr. McNULTY. Mr. Spear, thank you very much. We are sorry for the long delay and consumption of your time here today, but the process would not admit anything otherwise. Thank you very much.

Mr. SPEAR. I understand. Thank you, sir.

[The following was received for the record from Mr. Spear:]

WATER AND WASTEWATER EQUIPMENT
MANUFACTURERS ASSOCIATION, INC.

Position Paper on the

1982 Clean Water Act Amendments

Legislative Goals

WWEMA fully appreciates both the effort and dedication of the Congress in securing the successful passage of PL 97-117. The signing of the construction grants reform bill marked a rededication of federal funding under Title II more toward environmental goals than a public works oriented program which tends to promote construction without regard to environmental results. The Clean Water Act in this reauthorization, however, does not require modifications anywhere near the magnitude of the construction grants amendments of 1981. Most of the problems still associated with today's clean water program result from the way in which the act has been implemented, not from the act itself. WWEMA believes the Clean Water Act including its overall goal to restore and maintain the integrity of the nation's water is fundamentally sound and does not require structural changes. It has been our experience in the past that any modification has resulted in a slowdown or backsliding of the entire program. The clean water program cannot afford further slowdowns and extensions of time if the industry is to maintain the quality, quantity, and technical expertise that presently exist.

However, if the Congress feels compelled to make minor adjustments to the act, then WWEMA suggests no change to the technology-based effluent standards and continued tight control of discharges containing toxic pollutants from either municipal/industrial sources. Technology should remain paramount to any water quality based control approach that might be advocated by some during this reauthorization. We further urge the Congress to view the tight control of toxic pollutants as an utmost urgent environmental goal. While we support technology-based effluent standards,

we also recognize that legislation cannot be tailored to a narrow base to cover all site-specific environmental conditions. Therefore, any variations requested of this type are a regulatory matter requiring no legislative input.

Extension of BAT Compliance Deadlines

The Clean Water Act requires industries to reduce their discharge of pollutants to water bodies by installing progressively more controls complying with the more stringent BAT requirements. In our opinion, the current BAT compliance date of July 1, 1984 cannot be met since the EPA is yet to issue BAT effluent limitation standards for direct discharges from 34 major industries involving 129 chemical or other toxic substances which require regulation under the act. This same tight compliance scheduling is present in the municipal construction grants program. However, in the 1981 Clean Water Act Amendments, the POTW secondary treatment compliance schedule was extended to 1988 for those POTW's experiencing reduction in financial assistance under the act or where changed conditions go beyond the control of the owner affecting the current compliance date. WWEMA agrees that the current BAT compliance schedule cannot provide for orderly industrial implementation by the 1984 deadline. We believe that an extension is warranted to a certain date between 1986-1988, as set by Congress.

It has been proposed to extend the deadline for issuance of regulations covering BAT effluent limitation guidelines to July 1984 including the national categorical pretreatment effluent limitation guidelines. WWEMA believes that the July 1, 1983 deadline should be maintained for major industrial categories such as organic chemical, pesticides, petroleum refining, etc. Maintaining the current compliance date for these industries would create an optimum impact on pollution and paralleling the water quality impact priority policy established by

Congress in P.L. 97-117 emphasizing projects that address water quality management considerations to achieve optimum water quality consistent with public health and water quality goals. We suggest the EPA be allowed to segment the issuance of these regulations with the major categories by July 1, 1983 and the balance by July 1, 1984.

NPDES Permit Life

Consideration has been given to providing for a ten-year NPDES permit life compared to the present five year. WWEMA believes that granting of said extension should be based on a demonstrated need by the permit holder. While we agree the extension of the permit term will reduce the annual permitting workload and provide more certainty for a long period making investments in pollution control more economical, the granting of such extension should not be a common or routine practice without a demonstration of need. A ten-year permit covers a long time which, as we have observed from the past, can include a multitude of national trend changes in financial, social and environmental priorities.

Civil Penalties

Section 309 provides the administrator with authority to administratively assess civil penalties up to $10,000 per day. WWEMA supports this provision as the minimum level to be levied upon a violator, provided civil penalties are enforced equitably between municipal as well as industrial violators of the Clean Water Act.

# # #

Mr. McNULTY. Our next witness is Frank Browne of the American Society of Civil Engineers and the chairman of the professional coordination committee, accompanied by Clyde Wilber, member of the professional coordination committee, will make the last presentation of the day.

Messrs. Browne and Wilber, the same apology to you; I know you spent long hours here today, and we are sorry that the process has eaten up as much of your time as it has. I had a client once that was given 25 years, and as he left the courtroom he said, "That guy is getting mighty reckless with other people's time." And I kind of feel like maybe that would be an appropriate thing for us to say to you here now. In any event, the floor is yours.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

COMMENTS ON THE CLEAN WATER ACT AMENDMENTS OF 1983

PRESENTED TO THE

SUBCOMMITTEE ON WATER RESOURCES
COMMITTEE ON PUBLIC WORKS AND TRANSPORTAITON

NOVEMBER 2, 1983

BY

FRANK BROWNE, PH.D., P.E.
CHAIRMAN
PROFESSIONAL COORDINATION COMMITTEE
AMERICAN SOCIETY OF CIVIL ENGINEERS

American Society of Civil Engineers

Members of the American Society of Civil Engineers (ASCE) do not just design buildings and bridges; many ASCE members are environmental engineers actively involved in the design and operation of municipal and industrial wastewater treatment plants. They provide the public with a safe water supply, and they protect them from hazardous wastes. ASCE members perform conprehensive nonpoint source and watershed management studies. They also perform water quality studies of lakes, streams and estuaries. ASCE members, therefore, play a primary role in the environment while working in consulting firms, industries, universities, and governmental agencies. A large percent of the 92,000 ASCE members are involved in environmental affairs. It is this involvement that brings us to these hearings on the Clean Water Act Amendments.

Primary Areas of Concern

The primary areas of concern in the Clean Water Act Amendments include:

- Nonpoint Sources
- Construction Grants Program
- NPDES Permits
- Enforcement/Civil Suits
- Operator Training

Nonpoint Sources

Discussion

Nonpoint sources of pollution include all pollutant sources related to rainfall, stormwater runoff, soil erosion and groundwater movement. Typical nonpoint sources include:

agricultural runoff
construction erosion and runoff
urban runoff
roadway runoff
septic tank effluents and
streambank erosion.

In order to properly manage nonpoint source pollution, we must first evaluate the magnitude of the nonpoint source problem. We must look at the magnitude of three elements of the problem:

1. What is the magnitude of nonpoint source relative to point sources?

2. What is the magnitude of the impact of nonpoint sources on water quality?

3. What is the magnitude of the nonpoint source clean-up effort needed?

Point vs. Nonpoint Pollutants

It is estmated that more than half of the pollutants reaching our waters are from nonpoint sources. Agricultural activities cause an estimated 5 billion tons/year of topsoil erosion. The total suspended solids concentration in some urban runoff is 100 times the concentration in raw sewage. The lead concentration is sometimes 1000 times greater than the lead concentration in domestic sewage. Livestock produce 1.2 billion tons of wastes each year.

From a quantity viewpoint, the magnitude of nonpoint sources are significant.

Impact on Water Quality

The impact of nonpoint source depends on the receiving water. In general, nonpoint sources have a minor impact on small and medium-size streams; they have a significant adverse impact on lakes, impoundments, large slow-moving streams, and sensitive areas. Since they are caused by rain events, nonpoint sources usually occur during high flow conditions and are flushed out of the stream system. Poor water quality conditions occur for small periods of time. The recently completed EPA Nationwide Urban Runoff Program (NURP) concluded that nonpoint sources from urban areas cause temporary violations of water quality criteria but, in general, do not adversely impact beneficial uses of the streams and rivers. The imapcts of nonpoint sources on stream biota are not well documented because the NURP studies and most past 208 studies concentration on physical and chemical water quality parameters rather than on biological parameters such as macroinvertebrates and fish.

Lakes, unlike streams, are significantly adversely affected by nonpoint sources. Nonpoint sources cause siltation, loss of capacity, eutrophication, and impaired water supply. These problems are caused by excessive amounts of sediments, nutrients and toxics entering and remaining in lakes, impoundments and large slow-moving rivers.

The following table presents a comparison of annual point source and nonpoint source loadings for total phosphorus and suspended solids for seven watersheds:

Watershed	TOTAL PHOSPHORUS % Point Source	TOTAL PHOSPHORUS % Nonpoint Source	TOTAL SUSPENDED SOLIDS % Point Source	TOTAL SUSPENDED SOLIDS % Nonpoint Source
Lake Nockamixon, PA	49	51	2	98
Rivanna Reservoir, VA	9	91	<1	100
Lake Chesdin, VA	2	98	<1	100
Sylvan Lake, NJ	0	100	0	100
Etra Lake, NJ	0	100	0	100
Lake Wallenpaupack, PA	2	98	<1	100
Columbia Lakes, MD	0	100	0	100

The above values, measured for both small (several square miles) and large (1200 square miles) watersheds, indicate that nonpoint sources contribute almost all of the suspended solids (sediments) and most (51 to 100%) of the phosphorus to lakes.

Magnitude of Clean-Up Effort

If nonpoint sources were managed based on their relative magnitude versus point sources, and no consideration for their impact on water quality, the magnitude of the clean-up effort would be almost impossible and certainly not cost-effective. The nonpoint source clean-up effort should be based on a careful assessment of both the relative magnitude of the pollutant loadings and the impact on water quality. In many cases, such as lake watersheds, nonpoint source controls can be effectively used to restore water quality or at least maintain existing water quality. A study of Brown County Lake in Kansas indicated that implementation of low-till agricultural methods would reduce the sediment loading to the lake by about 56% from 5.6 tons/acre/year to 2.5 ton/acre/year.

Recommendations

From our very limited knowledge of nonpoint sources and their impacts on water quality, we can conclude the following:

1. We do not know enough about nonpoint sources: how they are generated, how to control them.

2. We do not have sufficient data on the impacts of nonpoint sources on aquatic life.

3. We do not have sufficient data to evaluate cost-effective controls.

4. We do not have sufficient site-specific data to properly evaluate whether a problem exists and how to solve the problem.

5. We do know that ultimately nonpoint source control is a local-state responsibility.

Based on these conclusions, the following recommendations are made:

1. Set up a National Commission on Nonpoint Sources to develop a nonpoint source management plan within 3 to 4 years. The plan should identify the real magnitude of the problem, identify realistic, cost-effective solutions, provide protocol for implementing the plan, and be national in scope. Congress should provide funds for this work.

2. EPA and SCS watershed management related programs should be continued at a much higher level of funding. A good example of an effective nonpoint source control program is the EPA Section 314 Clean Lakes Program. The Clean Lakes Program uses 50-70% federal funding to study and to implement lake restoration and watershed management projects.

3. EPA programs such as 205(J), 303 and 208 should be integrated to provide a maximum of 50 to 70% funding to states and local agencies to develop local nonpoint source management plans.

Construction Grants Program

Discussion

The construction grants program has created the impression that the Federal Government will pick up the tab for pollution control work. Local funding of projects, even if available, is often delayed in hopes of obtaining federal assistance.

The construction grants program has resulted in high-tech, sophisticated (and often over-designed) plants being built to serve a limited area that cannot or will not hire experienced operators to run them. Moshiem, TN, for example, is installing a pressure sewer system with over 200 pumps and is not making provisions for maintenance. Another city passed a sewage rate ordinance promising to collect money for the operation and maintenance of the wastewater treatment plant. This money, however, is being used to extend sewer lines while the plant deteriorates.

Too often the construction grants program has been used to construct expensive tertiary treatment plants without first performing a detailed water quality study of both point and nonpoint sources. Many tertiary plants, therefore, were constructed but no improvement in water quality resulted.

Recommendations

The construction grants program should be phased out over a period of nine to ten years. Congress should provide a reasonable level of funding to the program while it is being phased out.

NPDES Permits

Recommendations

Since both Epa and state resources are relatively scarce and should be used as efficiently as possible, permit terms should be extended from five years to ten years.

Enforcement

Recommendations

Present EPA enforcement is unrealistic; it has no credibility. EPA should enforce industries, municipalities, and nonpoint sources equally. EPA should set firm and realistic schedules, and EPA should strictly enforce these schedules.

Operator Training

Recommendations

EPA should provide funds and support for wastewater treatment plant operator training and permit writer training.

Mr. McNULTY. Please proceed.

TESTIMONY OF FRANK BROWNE, PH. D., P.E., CHAIRMAN, PROFESSIONAL COORDINATION COMMITTEE, AMERICAN SOCIETY OF CIVIL ENGINEERS, ACCOMPANIED BY CLYDE WILBER, MEMBER, PROFESSIONAL COORDINATION COMMITTEE

Dr. BROWNE. I have a written statement I would like to have put in the record. I am going to try to summarize it in my own words. I am Frank Browne, chairman of the Professional Coordination Committee of the American Society of Civil Engineers. I am also president of an engineering consulting firm in Pennsylvania.

The American Society of Civil Engineers has 92,000 members. Not all of these members are designers of bridges and buildings. I am going to give you some background so you can see why we are so involved in the environment.

A good percentage of the ASCE members are environmental engineers and scientists who are involved in municipal and industrial wastewater treatment, and in water supply and treatment. They are also involved in hazardous wastes and in nonpoint sources and watershed management studies, and even some engineers get to the point of being involved in ecological surveys of lakes and streams.

Civil engineers are not just engineers. In background they have knowledge and education in biology, chemistry and mathematics. You find ASCE members as consultants, like myself, and you find them in universities, you find them in industries, and in government.

Therefore, based on this background, you can see that the ASCE and their members have a primary interest and a very, very strong role in the environment. Today I would like to talk about several areas of concern. In general, we think the Clean Water Act is a good law. The areas of concern we are talking about would be nonpoint sources, construction grants program, the NPDES permit program, enforcement by EPA and the States, and treatment plant operator training.

Again I would like to emphasize that we think the existing Clean Water Act is a good act. I think I would like to see more refinement rather than an overhaul, of the Act. Every time there is an overhaul there is a tremendous delay in getting anything done over the next several years. One of the major changes I feel might be in the area of nonpoint sources.

I would like to go through each area just briefly. My main concentration will be on nonpoint sources. I want to just give a brief definition; nonpoint sources are caused by stormwater runoff and erosion. They are basically defined as anything that is not permitted under the NPDES program. Obviously, you are probably aware that you have agricultural runoff, construction erosion and runoff, urban runoff, and roadway runoff. Every time we build a highway or a roadway, it becomes a conduit right down to the stream. We have septic tanks and stream bank erosion, which is a natural process usually aggravated by development and agricultural practices.

To properly manage the nonpoint source problem we must look at the magnitude of the problem. This has been looked at over many years by different studies like the NURP program and 208 program. I think we have to look at the magnitude of the nonpoint source loading relative to point source. We have to look at the magnitude of nonpoint sources as they impact water quality, what harm is it really doing, and then the magnitude of the required cleanup effort.

As we look at point sources versus nonpoint sources, we find that some people estimate that half the pollutants entering our waters are from nonpoint sources. We find that agriculture erosion is equal to around 5 billion tons of soil per year, and livestock produces 1.2 billion tons per year of animal waste. There are all sorts of numbers I could go on and on about, but basically if you want to look at the magnitude of nonpoint sources it is a tremendous magnitude. It is significant.

Let's look at its impact on water quality. If you look at the impact, it really depends on what kind of receiving water we are talking about. If we are talking about small to medium size streams that flush themselves very quickly, many studies are showing that nonpoint sources are not a major water quality problem. Where they become a major problem is where you have large sluggish rivers, where you have lakes and impoundments or sensitive areas.

If you look at a comparison of point sources and nonpoint sources, you see that point sources are something that flow into a stream or a lake every day and can cause a problem. They are there all the time during low flow and high flow. If you look at nonpoint sources, you basically find that 80 percent of the loads

20-955 O—84——117

come in 5 percent of the time, and usually when it is raining, obviously, and usually during high flow conditions, so you have a lot of dillution water.

Now, let's look at streams. If we look at the EPA nationwide urban runoff program, what we call the NURP program, they just recently came out with a final report which was asked for by Congress several years ago, and two major conclusions came out.

Remember, it is an urban runoff study even though many of the studies ended up being in suburban and urban areas, but one conclusion was that nonpoint sources cause temporary violations of water quality criteria. Nonpoint source produce low dissolved oxygen, high heavy metals and high suspended solids. Their second conclusion was that nonpoint sources do not adversely affect the beneficial uses of the streams. Thus we have nonpoint sources violating the laws but they don't really violate the stream use, at least when we are talking about medium and small streams.

One weakness I would like to point out as we have heard earlier when we talked about 316(a) studies and things like that is that one weakness of the NURP study and a weakness of the 208 program that went on in the past five to six years was that we spent too much time looking at water quality.

You have heard people today talking about water quality not being impacted. What happened in many cases, we have not studied the biota, the biology of the stream. We haven't looked at the macroinvertebrates or the fish carefully enough. You could have a stream with good water quality but poor biology.

Why do we have water quality? Mainly for the use of man and the biota. The big weakness in all of the EPA programs now is not having enough biological data.

Let's go into lakes for a few moments. Where I feel that we have a nonpoint source problem is in lakes, impoundments and in very large rivers.

The nonpoint sources cause lake siltation, loss of capacity, eutrophication as you are aware with the algae blooms and health problems and also the loss of recreational benefits.

You have impaired water supply when you have siltation in a lake or an impoundment. You have loss of recreational use and, of course, economic losses.

Nonpoint sources impact lakes due to sediments and nutrients like phosphates, nitrates, and toxics that stay in the impoundments. This is why nonpoint sources are so important. In a stream there is a tendency for the pollutants to flush downstream to a large river or to the ocean.

In the lake, the lake is like a big settling basin. It stays in the basin so there is very little flushing of pollutants. A comparison of seven watersheds that we have studied in Virginia, Maryland, Pennsylvania, and New Jersey actually show that nonpoint sources account for almost 100 percent of the sediments that go into it each year, and even when you have several sewage treatment plants you will find that almost 100 percent of the sediments come from nonpoint sources.

We found that roughly 50 to 100 percent of the phosphates come from nonpoint sources, so you can see that the real problem in lake impoundments and big rivers is going to be the nonpoint sources.

The magnitude of the clean-up effort is looked at too. It is impossible to clean up all the nonpoint sources. Some Congressmen in the past have been talking about having buffer strips throughout the country on every farm. I don't think this is a solution we want to go to. I don't think we can afford it.

We, basically, can come up with a management program if we find out where we have the problems, and can we even do anything about them, and where we can do something about them, try to fix them up.

We have some recommendations which are a little bit different than some of the proposals coming through Congress right now. We feel, No. 1, that Congress should set up a national commission on nonpoint sources, something similar to the National Commission on Water Quality.

Right now EPA is doing something very similar in-house. I think they have a couple million dollars to study past studies, but we feel something like this has to be more formal. We think there is a lot of data available. We don't want to see Congress funding many more studies. I think we need more of an evaluation of past studies.

We feel the Commission should develop a nonpoint source management plan within 3 to 4 years rather than 1 or 2 years as proposed right now.

Basically, they should identify the magnitude of the problem, identify cost effective solutions, and provide guidelines for the States for implementing this, and these guidelines should be technical and financial.

I think financial assistance is going to be very, very important in the future.

Obviously, we feel that Congress should fund this commission.

A second recommendation is that EPA and the Soil Conservation Service, [SCS] watershed management programs should be continued and should be given higher funding.

There are some real good nonpoint source watershed programs around, but every year they get killed and they get resurrected at the last moment or they are reduced in funding, and then we talk about creating new programs, when we really have some great programs on the books.

A good example is the EPA's Section 314 Clean Lakes Program. It is a program that uses 50 to 70 percent Federal funding, not 100-percent funding like many programs. to study the program, the problem, and then to actually implement changes. A lot of people think of the clean lakes program as a lake restoration program when actually more than half of the programs are watershed management-oriented. It just depends on the year and how EPA is feeling as to which ones they fund. Sometimes it is dredging, sometimes it is dredging in conjunction with cleaning up land use problems.

Third, as a recommendation we feel that programs such as Section 303, 208, and 205 should be integrated to provide funding for State and local nonpoint source activities.

We do believe that in concurrence with some sort of a commission we should have more money going to the States to identify

nonpoint source problem areas rather than coming up with implementation programs at this time.

Getting into the construction grants program, we feel that the program has created the impression that the Federal Government is responsible for pollution control work; that the Federal Government should pay for it all, but we don't think that is really the answer.

Some resulting treatment systems are too complex; they are much too big in many cases; they are overdesigned and they are energy-inefficient. They actually cost too much also.

Many tertiary treatment plants were built without evaluating the nonpoint source problems, so they were built with the idea that if we put in tertiary treatment with all sorts of chemicals, we will get a nice water quality, and we didn't get the water quality because nonpoint sources were the problem.

A good example is the Blue Plains Treatment Plant, which Mr. Wilber has actually worked on. This year they had a tertiary treatment plant that cost a lot of money, public funds; it works very well, but it hasn't solved the problem it was designed for and that was to avoid algae blooms.

In general what I found is that locally funded treatment plants are and would be simpler, smaller and cheaper. As a consulting firm, we work a lot with local clients who don't have money, and it is amazing how much cheaper you can design a treatment plant and build it for when you don't have the redtape and regulations or just the idea that you know there is a lot of money available.

We feel that to some extent the construction grants program should be phased out over a 9- to 10-year period.

You might want to give consideration to the low interest loan programs or even private approaches as we heard earlier today. That is a nice approach also.

It should be probably phased out as we know it now. If not phased out, it definitely needs some streamlining.

Just some quick comments on the NPDES permits. We feel since both EPA and the States have very limited resources, these resources should be put in an area that is really important rather than every 5 years reviewing permits, so we feel the permit period should be extended from five to 10 years.

You can have an intermediate review if need be so you can open them again, but they should be extended to 10 years.

Relative to enforcement, it all comes down to what enforcement. It used to be years ago that EPA and the State would enforce industrial discharges because you can close down an industry, and you couldn't enforce a municipality because you couldn't close them down. That has been corrected because in the last few years they don't enforce either one.

I think there is no credibility at all in the enforcement program. I find industries in Virginia say—that have heavy metal discharges, yet their permit makes them measure things like BOD and pH, no metals at all.

It is obvious to the regulatory agencies that they have heavy metal. It is kind of a laissez-faire program. We feel that there should be equal enforcement of individuals, municipalities and even nonpoint source areas.

We think that EPA should set realistic schedules and strictly enforce them. Sometimes they don't enforce schedules because they are just not realistic.

Last, we have operator training. I think we do need trained operators to care for the billions of dollars worth of equipment that the Government has funded so we feel that the EPA should definitely provide funds for operator training.

In summary, we really feel that the Clean Water Act is a good act. It doesn't need a lot of changes. It doesn't need higher enforcement penalties. It just needs people to do what the act says.

I do think it needs help on nonpoint sources. That was one weak area back in 1972 and it is good to see that Congress is going that route.

Mr. McNULTY. Thank you.

Mr. Stangeland.

Mr. STANGELAND. I have no questions.

Mr. McNULTY. Mr. Daub.

Mr. DAUB. Thank you, Mr. Chairman. Just a brief question.

I am interested in your view relative to the loan program since you recommend the phasing out of construction grants program.

Would you comment as well on privatization?

Dr. BROWNE. Well, for my committee I probably can't give you an opinion. My own opinion is, I am for the private approach.

I have seen for years other areas, whether it is trash pick-up, down in Gainesville, Fla., where they abolished municipal trash pick-up years ago and went to private pick-up and it is efficient and cheaper.

Studies show New York City could have gone for the private approach except for the union problem. It could have been done cheaper.

I do think it could have been done cheaper. I don't have all the facts that Mr. Goldman had, but just from reading his and other articles, I am definitely in favor of it strongly.

Mr. DAUB. Thank you for your comment. I appreciate your testimony.

Mr. McNULTY. Members of staff.

Then that, by my agenda, completes this portion of hearings on possible amendments to the Clean Water Act. We are grateful to you, Dr. Browne and Mr. Wilber. Again, we are sorry for the length of time you were here.

If there is nothing further, the subcommittee will stand in recess.

[Whereupon, at 3:25 p.m., the subcommittee recessed.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

THURSDAY, NOVEMBER 3, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to notice, at 10:07 a.m., in room 2167 Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. The subcommittee will come to order, and we will continue our hearings on the Clean Water Act.

Our first witness for today is Maynard Stiles, director of public works, city of Memphis.

And, we have with us this morning our distinguished colleague from Tennessee, the Honorable Congressman, Don Sundquist, who we are offering the special privilege of welcoming you, Mr. Stiles.

Mr. SUNDQUIST. Thank you, Mr. Chairman.

I will try to be brief. I appreciate the opportunity to introduce this gentleman to this committee.

Mr. Maynard Stiles is director of public works for the city of Memphis, and he is here today to testify, as you know, with regard to revisions in the Clean Water Act, and related issues.

Mr. Stiles has had experience in both the private and the public sector. He has served as public works director for Memphis since 1978. Prior to that time, Mr. Stiles served the city of Memphis in a variety of positions, including director of sanitation services purchasing agent, administration, assistant to the public works director, and district superintendent for the sanitation department. He now serves as president of the Tennessee chapter of the American Public Works Association. He is a member of the board of directors of the Tennessee Municipal League, a member of the Metropolitan Sewage Association.

Mr. Stiles' experience gives him an in-depth understanding of the problems of our country's metropolitan areas, and the problems that they face in regard to Federal water pollution control.

I am sure his testimony today will be of value to the subcommittee. Let me extend a very warm thanks to Mr. Stiles for making this trip and sharing his experiences with this subcommittee.

Thank you, Mr. Chairman.

Mr. Stiles.

Mr. ROE. We thank you very much for your introduction.

Now, we would go to Mr. Stiles, if you will.

TESTIMONY OF MAYNARD C. STILES, DIRECTOR OF PUBLIC WORKS FOR THE CITY OF MEMPHIS, TENN.

Mr. STILES. Thank you, sir.

Mr. Chairman, members of the committee, I would like to extend my personal thanks for the opportunity to appear before the committee today. In addition to that, the appreciation of the city of Memphis, for the opportunity to express our views on amendments to the Clean Water Act.

In 1972, the U.S Environmental Protection Agency established secondary treatment regulations which required all wastewater to be treated to at least a level of 30 mg/l biochemical oxygen demand [BOD] and 30 mg/l total suspended solids [TSS].

These standards reflected numerical values which were believed to be obtainable by well designed, well operated and maintained secondary treatment systems.

When the Environmental Protection Agency imposed these categorical standards 11 years ago throughout the Nation, for the treatment of wastewater, there was an attempt on the part of that Agency to achieve the goals established by Congress in the shortest timeframe possible. Today, 11 years later, we have made dramatic strides toward achieving those goals, and at the same time, a tremendous amount of information has been gathered which is now ready for utilization in establishing more economical ways to achieve the desired goal of clean water.

The development of laws, regulations, and guidelines, utilizing the knowledge that has been gained over the last 11 years, can lead us on a path toward achieving our goal of clean water and, at the same time, achieve that goal in the most economical manner possible.

In accordance with current regulations, the city of Memphis constructed two wastewater treatment facilities, the first became operational in 1975, and the second in 1977. Both facilities were constructed with the assistance of Federal funds. Today, these plants consistently meet the required effluent permit limits.

While the city of Memphis consistently achieves the required level of treatment, our sewer-use fees have remained among the lowest in the Nation.

Although sewer fees paid by residential, commercial, and industrial customers in Memphis are quite low when compared to other cities across the Nation, they are a burden nevertheless; a burden that takes money out of taxpayers' pockets, a burden that raises the price of goods produced by industry.

In September 1968, the Tennessee Department of Public Health, Division of Stream Pollution Control, released a report entitled "Predicted Effects of Primary Treatment at Memphis on Water Quality in the Mississippi River." During the period the study was conducted, all of the city's wastewater entered the river untreated through four major interceptors. The report pointed out that "to date no information has been presented to indicate that a serious pollution problem exists in the Mississippi River below these discharges" even in an untreated state.

The report concluded by saying "the necessity for providing secondary treatment at Memphis, at the present time, appears unnec-

essary for the protection of water quality and downstream uses of the River," however, in compliance with the law we proceeded to construct and operate facilities capable of achieving secondary treatment.

The city of Memphis, whose sewer system serves the majority of Shelby County, because of its population and the number of industries served by the Memphis sewer system, was near the top of the priority funding list for the State and, therefore, Federal funds for construction of the two wastewater treatment facilities was readily available.

At the same time, other cities and towns across the State of Tennessee were and are faced with serious pollution problems that threaten the well-being of lakes and mountain streams. These cities and towns have been unable to address their treatment problems as local funds are insufficient to construct the needed facilities and their position on the priority funding list are too low to qualify them for Federal assistance; yet the impact of their effluent on the receiving waters is not only measurable, but highly negative.

Mandated secondary treatment in Memphis has resulted in significant Federal and local expenditures for construction and yet any improvement of the quality of the Mississippi River cannot be measured. At the same time, discharges from smaller cities and towns has continued to add to the demise of lakes and mountain streams throughout other parts of our State.

The average flow in the Mississippi River is some 353,000 million gallons per day, while the lowest recorded daily flow in history was approximately 91,000 million gallons per day. These are figures that were accumulated from the Corps of Engineers.

The assimilative capacity of the Mississippi River, at the lowest recorded flow in history which was reached in 1980, is in excess of 14 million pounds of BOD per day. Loading of approximately 8 million pounds is present in the river when the flow reaches the city of Memphis, leaving an additional assimilative capacity available in excess of 6 million pounds per day.

We are presently discharging into the river approximately 70,000 pounds per day from our treatment facilities, which equates to approximately 1.1 percent of the additional assimilative capacity.

I would point out the biochemical oxygen demand loading of the river before it reaches Memphis is not as a result of discharges from upstream cities and towns, but is rather primarily as a result of the natural environment, such as decaying vegetation, upstream from the city.

The discharge from our two wastewater treament facilities is currently 145 million gallons per day, and by using the flow of the river at the lowest recorded flow in history, this would equate to a dilution factor of 628:1, while at the average flow it would equate to 2,400:1.

The Mississippi River is the largest river in North America and obviously has a tremendous capacity to assimilate wastewater.

No one has the right to utilize all of the assimilative capacity of a stream, however, at the same time, a river is a natural resource like an underground freshwater aquifer or a natural harbor and that natural resource should be utilized. Certainly there should be

constraints, we should not allow the natural resources to be damaged, however, we should take advantage of those natural resources in a manner permissible without inflicting damage.

Utilization of our rivers and streams and their assimilative capacities can be a cost effective and environmentally sound solution to the problem of pollution. However, based upon existing laws, we have not been allowed to utilize this readily available natural resource.

Many other cities throughout the Nation are located on major inland waterways where secondary treatment facilities have been constructed, or are now being contemplated. It might be entirely possible that many of these cities where facilities have not been constructed, could design to achieve limits less stringent than the secondary requirement and, at the same time, improve water quality.

Preliminary surveys indicate there are over 100 cities located in 18 States across the Nation which could be affected if the Clean Water Act allowed for increased discharges based upon the assimilative capacity of the receiving major inland waterway.

Based upon the latest information published, in excess of $92 billion will be needed to provide funds for construction of sewage treatment plants and sewers to meet the needs of the existing population. Our preliminary survey indicates an estimated minimum of 10 percent of this amount could be deleted from the budget if the law were changed to utilize our natural resource and allow for treatment requirements based upon achieving clean water standards, as opposed to categorical standards.

In addition to the Federal savings, which could be achieved, our estimates indicate that if the city of Memphis were to reduce its level of treatment from the required secondary to a modified secondary level—70 percent removal—approximately $250 million, over a 20-year period, could be saved in operating expenses.

Assuming the savings to the surveyed 100 cities, based on their population, would be proportionate to the savings which could be realized by Memphis, their reduction in operating expenses would be approximately $3.5 billion over a 20-year period.

The advantages of ocean dumping on a case-by-case basis is being realized, as a result of amendments to the law.

I would submit that relaxing standards where the discharge is into a major inland waterway is a more attractive alternative than is ocean dumping. Considering the currents of the rivers versus ocean currents, the effects of tides, the effects on aquatic life, it is not unreasonable to expect that many of our major inland waterways are better assimilaters of waste than are the oceans.

It would appear to be critical that a practical approach, utilizing the information we have gathered over the last 11 years, for determining discharge standards for major inland waterways to be implemented.

Already the city of Memphis has detailed a proposal to study and confirm or disprove the effects of discharges of varying quality from the city of Memphis on the Mississippi River. The program would entail sampling on a weekly basis, numerous stations on the river. The analyses of those samples would include not only biochemical oxygen demand, but total suspended solids, dissolved

oxygen, and temperature, and also a variety of chemical compounds.

The quality of the effluent from the Memphis treatment plant would be carefully varied throughout the term of the study, and the resulting impact recorded. This study would be conducted by the city of Memphis, with funds being provided entirely by the city, however, the Tennessee Department of Public Health and the U.S. Environmental Protection Agency have agreed to carefully monitor the results.

The final level of treatment would then be determined as a result of the study findings after complete review by all interested parties.

We would not suggest or support any modification of the presently permitted pesticide discharge limits.

At this point in time, both the U.S. Environmental Protection Agency Region IV and the Tennessee Department of Public Health have endorsed the study, however, because current laws do not allow for even a temporary variance from secondary treatment, we have not been able to implement the proposed study.

It is clearly important, therefore, that laws and regulations be changed to allow the Administrator of the Environmental Protection Agency the flexibility to grant temporary and permanent secondary treatment variances to waste treatment plants, based upon the ability of the receiving stream to assimilate that effluent discharge without adversely affecting water quality.

The ability to allow secondary treatment variance on a case by case basis would certainly have far reaching effects.

Federal pollution abatement dollars could be beneficially reallocated so that real water quality threats could be more quickly eliminated.

Residential sewer use rates could decline as a result of decreased energy utilization and decreased operating expenses. There would be a reduction in sludge production, thereby reducing the cost to various communities of disposing of the sludges generated.

Treatment costs incurred by industries could be reduced, thereby resulting in less costly goods and services and having a positive impact upon gross national product and the ability to be more competitive at the international level.

All of the above can be accomplished while improving water quality in major inland waterways, and at the same time, continuing with concerted efforts to minimize priority pollutants in any discharge.

Certainly the industrial pretreatment program is useful in this regard, however, I would point out the city of Memphis implemented its own program with all industries discharging into the city system over 2 years ago which had the effect of improving the characteristics of waste received and the quality of our sludges.

We would strongly endorse that all local communities implement their own pretreatment program based upon characteristics of the waste to be received and the capability of the facility to properly treat the waste stream.

We would suggest that section 301(h) of our current law, public law 95-217, could be amended by simply including after the words "marine waters" the words "and major inland waterways."

We would not propose to change any other language of that section.

With this change, it is our strong opinion that the following would be accomplished:

One. In excess of 10 percent of the estimated Federal grant need could be eliminated.

Two. A major number of cities across the Nation could save in excess of $3.5 billion over the next 20 years in operating expenses.

Three. Residential, commercial and industrial sewer fees could be adjusted downward, thusly reducing the burden of fees on the taxpayers and making more funds available as spendable income.

Four. Industries could reduce their costs, resulting in less expensive goods and services, thusly having a positive impact on the gross national product, and placing those industries in a more competitive position in the international market.

All of the above could be accomplished with one change to the existing law based upon knowledge gained over the last 11 years, and at the same time, achieve our stated goals of a safe and healthy environment through the wise use of our limited resources.

Thank you.

Mr. ROE. I want to thank you very much for your substantive testimony. I do not have any questions.

Any questions of the gentleman?

The gentleman from Minnesota?

Mr. STANGELAND. I have no questions, Mr. Chairman, but I just want to thank the gentleman for some excellent testimony, something that should certainly be studied and looked at.

Thank you.

Mr. ROE. Are there any other questions?

Thank you very much.

Thank you, Mr. Stiles. I appreciate your being with us.

Our next group of witnesses is the sludge management panel of the American Clean Water Association, participating in that presentation, Mr. Larry Silverman, executive director, American Clean Water Association; Mr. Steve Campbell, Bio Gro Systems, Inc., Annapolis, Md.; Mr. John O'Neal, AD+SOIL Services, Inc., West Chester, Pa.; and Mr. N. Grove Teates, Wheaton, Md.

We want to welcome the panel to our committee, and we have your testimony, which will appear in the record in full. So, suppose we start out first with Mr. Silverman.

The full text of your prepared statements will appear in the record at this point.

[Statements referred to follows:]

TESTIMONY OF LARRY SILVERMAN ON CLEAN WATER ACT

Mr. Chairman, I am very grateful for the opportunity to testify about the many important issues surrounding the reauthorization of the Clean Water Act.

The American Clean Water Association was founded five years ago to represent a diversity of interests and disciplines united by a common commitment to clean water at an affordable price. Although most of our members are business or municipal people, we work closely with and consider ourselves part of the environmental lobby. We tend to represent innovative and alternative approaches to water and sewage management and finance. We see ourselves on the frontier of a changing water industry—a difficult and often uncomfortable outpost, but one that must be maintained. Our members include:

Sewer maintenance and repair companies, and those manufacturing products for the repair of existing structures;

Water conservation companies including manufacturers of low flow plumbing fixtures, consultants, irrigation companies and meter companies;

Engineering and other firms with a strong background in agronomy and soil science and experience managing wastewater through agricultural methods;

Practitioners of small scale, decentralized waste management techniques;

Trainers and operations specialists;

Water monitoring companies;

Media and public relations specialists with knowledge of water and waste issues; and

Financial houses with expertise in alternative finance.

My purpose here today is just to set out briefly some of the Association's views on the issues before your committee today. In general we:

1. *Oppose major changes to the 1981 municipal sewage treatment law.* Generally, the 1981 reforms to the sewage program have had a positive impact on sewage treatment planning and construction. The area of greatest concern to us is the elimination of Steps I and II grants, which has created many problems particularly in rural communities.

We would oppose at this time efforts to raise the federal grant share from 55 percent to 75 percent.

2. *Available funding.*—The sewage and water management industry is undercapitalized. We appreciate Congressman Howard's bill to raise grant money from $2.4 to 5 billion. However, we believe a Congressional policy is needed which encompasses not just EPA grants, but Farmers Home program and federal tax policy as well. Little real progress will result if Congress increases EPA grants and at the same time eliminates tax benefits which encourage private investment in wastewater systems. A lack of Congressional leadership is all too evident. In general, we concur with the testimony of Mr. Goldman of Arthur Young and Company one the subject of privatization. (Mr. Goldman is one of our members.)

3. *Sludge management.*—The sludge management provisions of the Senate bill (S-451) will greatly increase regulatory requirements while providing no clear decision making process. It represents the worst of two worlds. We need a simple, definitive regulatory process that protects the public and provides certainty to municipalities and contractors. Twenty states now make sludge management a part of their NPDES permits. This system seems to work well. Industry and the states look to EPA for information and guidance. The federal government must develop regulations that facilitate the movement of safe sludge derivatives in interstate commerce. In general, we need to navigate between over regulation and under regulation.

We need much more funding in the areas of demonstration projects, public education and operator training.

4. *Non-point source pollution control.*—In general, we support Mr. Oberstar's bill on this subject. We believe a clearer decision or arbitration process is needed to settle interstate conflicts. The Water Quality Act of 1965 may provide an excellent model.

Demonstration grants should be available to states, municipalities, and private organizations (profit and non-profit) who have something useful to offer in this field.

5. *Wetlands protection.*—We support the provisions in the Howard bill dealing with wetland protection. They are a necessary protection against unwise regulatory decisions that have been made or are threatened by the present administration.

6. *Pretreatment.*—It is time to get on with the job of pretreatment. The unregulated flow of industrial toxics into POTW's is a great impediment to clean water, economical utility operations and safe sludge management. We oppose the "opt out" proposals and other schemes to delay implementation of pretreatment standards by excessive regulatory changes.

We also oppose efforts to immunize indirect dischargers of non-toxic pollutants from federal enforcement actions. When a POTW is polluting the waters, EPA and the states should be permitted to take any steps necessary consistent with law, to abate the nuisance. If the best way to stop pollution is through disconnection of the industrial hook-up, so be it.

7. *Training.*—More funds should be authorized and appropriated in the field of operator training and information dissemination. We encourage the Investigations and Review Subcommittee to look into the manpower training situation today and to recommend broad reforms to this entire effort.

Thank you.

STATEMENT PRESENTED TO WATER RESOURCES SUBCOMMITTEE OF THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE. THURS., NOV. 3, 1983.

My name is Stephen Campbell and I represent Bio Gro Systems, Inc. Thank you for providing me with the opportunity to present information regarding land application as a means of removing sludges from waste treatment systems and simultaneously providing a beneficial re-use which is economically and environmentally sound.

Bio Gro Systems is a privately owned company with headquarters in Annapolis, Maryland, which specializes in the application of suitable sludges as fertilizer/soil conditioner to private agricultural land. Bio Gro Systems has operated over 30 successful land application projects in 9 states in its 5 years of operation. These projects range from several thousand wet tons to over 150,000 wet tons per year. In its 5 years of operation, Bio Gro has obtained land application permits for over 70,000 acres of productive farm land. Bio Gro Systems has a highly qualified technical staff of agronomists, soil scientists and project personnel as well as the specialized equipment required for a successful land application project.

Any evaluation of the potential for land application must include a realistic assessment of both positive and potential negative effects of sludge application. On the positive side, land application presents an excellent opportunity to recycle rather than dispose of a nutrient-rich material, i.e. sludge, and is thereby a positive environmental program. Because it adds substantial amounts of organic matter to many soils, a good land application program can reduce erosion potential in sensitive areas such as watersheds as compared to the erosion which may be experienced in conjunction with the use of conventional tilling practices and application of conventional fertilizer materials. Land application of sludges at agronomic rates, that is, at rates which satisfy the nutrient needs of the crops being grown, will provide substantial economic benefit to the recipient farmers, as may be demonstrated by the fertilizer value which is contained in the Blue Plains sludge currently being land applied by Bio Gro Systems in several counties in Maryland and Virginia. These values are based on the analyses of the sludge nutrient content over a period of 1½ years of operation. The $166.50 per acre figure represents the value during the first year after application. During subsequent years, additional nitrogen and phosphorus, as well as lime, will become available, although in smaller amounts. In addition to the direct economic benefit to the farmers who receive sludge, such application will also substantially improve the soil properties of the land so treated. The improved moisture holding capacity, tilth and nutrient holding capacity, are all of substantial benefit to the farming operation.

With all the positive effects I just mentioned, we frequently are asked during such presentations as I'm giving today—"then how have we gotten along without sludge all these years?" One of the reasons is inherent in the very question as posed. The potential negative effects of sludge land application center primarily around the lack of public knowledge and thereby, public acceptance of such practices. Although land application of sludges is increasing in this country, and I believe will continue to do so beyond the approximately 40% which is currently being returned to the land, many people remain uninformed and skeptical about land application. Public acceptability can be achieved by the dissemination of information at public hearings, public meetings, through newspaper articles, and particularly by field demonstrations which clearly show how a project is operated. Once the lack of knowledge has been overcome, it has been our experience that most objections on the part of the public tend to dissipate.

Two other potential negative effects should be mentioned in any discussion of sludge and land application. These effects center around aesthetic concerns and environmental concerns. A well managed land application program is in no way offensive either to the people who are participating in the program or to the neighboring communities. By careful attention to set-back requirements, by injecting sludges wherever possible beneath the soil surface, and by working closely with farm communities receiving the sludges, the impact of a land application program from an aesthetic point of view is virtually indistinguishable from normal agricultural operations. Both public acceptability and aesthetic concerns deal with intangible effects. Environmental concerns, on the other hand, center on the real characteristics of sludges. This is the area in which a tremendous amount of research, much of which was funded by the federal government, has been conducted during the last 15 to 20 years. The technical information regarding metals, pathogens and other potential contaminants has been well documented and is available to both the scientific community and to those who operate land application programs. However, much of this information is unknown to the public at large and must be interpreted and ex-

plained to people in order to overcome the third potential negative effect of a sludge application program—environmental concerns. Additionally, it is important that any land application program utilize technically competent people to manage such a program and thereby avoid any possible environmental problem. I would like to point out that at rates suitable for agricultural use, using appropriate sludges will have no adverse environmental effects. I would also like to read to you from the "Statement of Federal Policy and Guidance Regarding Land Application of Municipal Sewage Sludge for the Production of Fruits and Vegetables". This document is dated 1981 and is signed by the Administrator of the U.S. EPA, the Secretary of the U.S. Department of Agriculture and the Commissioner of the United States Food and Drug Administration. And I quote . . . "It is therefore, the position of the Environmental Protection Agency, the Food and Drug Administration, and the U.S. Department of Agriculture, that with the adherence to the guidance contained in Part II. of this document, the safety and wholesomeness of the fruit and vegetable crops grown on sludge amended soils will be assured." Part II. contains the technical guidance for land application of sewage sludges for production of fruits and vegetables.

In any consideration of land application, a number of factors need to be addressed to determine the viability of such an option. Some of these factors are—quality of the sludge itself, that is, is it considered acceptable for agricultural or the proposed use or can it be made acceptable by some additional process? In any off-site sludge handling system such as land application, transportation distances and therefore, costs, need to be assessed in determining the viability of the option. In many cases, particularly with land application in colder climates, wintertime and inclement weather, storage facilities are essential for the operation of the land application system. I have alluded to the need for public acceptance and this is an on-going function of any land application project. Each new area must be approached with the same degree of concern on the part of those who are land applying sludges. Many of the same questions will be asked repeatedly because people's concerns are frequently very similar but they must be addressed anew and adequately each time. The regulatory framework within which sludge application can proceed also must be considered in setting up a program. Most states either have or are adopting regulations and guidelines specifically dealing with land application of sludges. Although these vary somewhat in detail, and require slight modifications of field management to conform to them, the approach is generally very similar from state to state. I would like to point out here that our 5 years of operation have shown us a tremendous growth in the number of states which have comprehensive sludge management programs for land application. This trend is continuing and we believe strongly that it should be supported by the federal effort.

To give you an indication of what is involved in most state's permitting programs, I would like to describe to you the overall process by which a land application permit to apply sludge is obtained. The primary element in the overall program is a Project Design. Such a document sets up the geneal conditions and operating procedures for land application. Conditions such as setbacks from water sources, property lines, roads and dwellings, are included, along with a description of field operations, application rates, spill control plan and specific equipment to be utilized for the project. Once a Project Design has received approval from the regulatory agency, specific sites are then reviewed and submitted for regulatory approval. Sites are selected based on their location and suitability to receive sludges. Such factors as texture, slope, proximity to residences and waterways, are all onsidered in evaluating sites. Soil samples are taken from all sites to be permitted and the results of soil analyses taken in conjunction with the specific sludge analyses for that project are used to determine application rates. Individual maps of each field must be submitted to obtain site permits. These maps are from soil surveys and topographic maps as well as any available aerial photographs. They are clearly marked to enable the regulatory agency to make a field inspection. Such inspections are a routine part of every permit that is issued and sites may be modified based on the requirements of field inspectors from the regulatory agency. Application rates may be requested in permit applications but the final determination of an applicatioin rate is made at the regulatory level and is based on information provided by the applicant as well as by the guidelines adopted by the agency.

Despite the voluminous amount of information which has already been obtained regarding sludges and their properties and the effects of sludge on soils and crops, it is the position of Bio Gro Systems that continued research should be conducted and recommendations made based upon knowledge as it is gained in this area. We believe that the land application option for sludge management is both viable and necessary and needs a firm basis in research in order to continue to grow successfully. Such groups as the EPA, the USDA and TVA have provided invaluable information

both to municipalities and to those who manage their sludge output. We would strongly urge that support for such research be continued. We also believe that the most productive and beneficial role of the federal government in the area of sludge management should remain in the realm of providing guidance and technical informatioin to the various state agencies who are now and will continue to be responsible for land application programs. We believe that the state agencies are the best judges of the specific conditions required within their jurisdictions and should receive assistance from the federal government in the form of support for such programs.

We would also like to suggest that every effort be made to depoliticize sludge as an issue. The concept of reutilization which does not involve a disposal facility and all its concomitant problems should help in this effort. We would urge each of you as individuals to evaluate the programs within your jurisdictions in that light. Agricultural utilization of sludges is not disposal, even though it may represent disposal from the perspective of the municipality or facility gnerating the material. As we have described today and have demonstrated during our last 5 years of operation, land application of sludges can turn a problem into a resource.

SLUDGE UTILIZATION—

BIO GRO Systems DOES MORE THAN PROTECT THE ENVIRONMENT,

WE IMPROVE IT.

THE NEED IS INCREASING FOR SOUND SLUDGE DISPOSAL PROGRAMS

Sludge disposal has become a major environmental, operational, and economic problem for industries and municipalities. As waste treatment increases in compliance with environmental regulations, the quantity of sludge generated at treatment facilities also increases. As more sludge is generated and energy costs rise, the cost of many traditional sludge disposal methods is causing generators to look for ways of utilizing sludge as a resource rather than approaching it as a problem.

A COMPREHENSIVE APPROACH TO SLUDGE DISPOSAL THROUGH LAND APPLICATION

Treated and stabilized sludges from municipal and a variety of industrial systems are a valuable resource which can be safely, beneficially, and economically utilized as a fertilizer/soil conditioner. Bio Gro's staff specializes in such sludge disposal through land application in accordance with all EPA, state and local guidelines and recommendations. We are experienced in dealing with land owners, civic leaders, and regulatory agencies, and we have the expertise to coordinate the needs and desires of these diverse groups.

THE TOTAL RESPONSIBILITY PROGRAM

Bio Gro Systems is organized for efficient sludge disposal. Our staff of skilled professionals combines many years of agronomic, engineering, and wastewater treatment experience in a variety of methods of sludge handling. This includes liquid, cake and composted sludges handled with pumps, loaders and dredges. Projects with which we have experience include: lagoon, clarifier, and digester cleaning, both one-time and long-term; feasibility studies, and consulting services for any or all stages of sludge disposal. Bio Gro can determine the most effective program for your specific sludge disposal needs.

We call our program "Total Responsibility."

PLANNING

Bio Gro provides the information and expertise needed for handling the complete sludge disposal operation. Our staff prepares cost-effectiveness analyses, proposed operating budgets, public relations management and works closely with federal, state and local regulatory agencies. Project planning also involves integrating farm crop rotations, evaluating proposed truck hauling routes, interfacing with treatment plant operations and personnel and scheduling time frames for completion.

PERMITTING

Bio Gro agronomists locate land and secure owner consent for land application sites suitable for the program. They implement an educational effort within the agricultural community to insure continued favorable response; have sludge and soil samples analyzed to determine proper application rates; and, with other members of Bio Gro's staff, prepare permit applications for submission to appropriate regulatory agencies. This program includes all specialized engineering and technical data required.

OPERATING

Bio Gro owns and maintains a large fleet of sludge hauling and spreading equipment. This equipment is capable of operating over most types of terrain, even under marginal weather conditions. Sludge is land applied by high flotation, low compaction vehicles, specifically designed to spread liquid and cake sludge while protecting soil structure. Bio Gro also has an extensive inventory of high solids ratio pumps specifically designed for hard-to-handle sludges. This equipment allows Bio Gro to be flexible and immediately responsive to our client's needs.

MANAGING

A Bio Gro Project Manager coordinates all phases of the sludge disposal program with the client, farmers, and land owners. The Total Responsibility Program encompasses the variability in sludge quantity and quality as well as the agronomic constraints of good crop management. A Bio Gro agronomist works closely with farmers to apply sludge in accordance with cropping schedules and fertilizer needs. If required, field crews can operate 24 hour shifts, 7 days per week. Equipment is maintained on-site where possible.

MONITORING

All results of sludge and soil testing are entered into permanent records. Using these data, the amounts of plant nutrients and other sludge constituents being applied to each site are calculated. This information is compiled into a system used to evaluate and plan the projected use for the site within guidelines established by the U.S. EPA, state, and local regulatory agencies. Detailed reports are filed by Bio Gro Systems as mandated by these agencies.

BIO GRO SYSTEMS

RESPONSIBLY & EFFICIENTLY MEETING YOUR SLUDGE DISPOSAL NEEDS

A sound land application program involves the agricultural and local community from its inception. The Agricultural Extension Service, Soil Conservation Service, civic leaders, and informed farmers in the area are included in planning and site selection. The capacity of sites to receive sludges varies with a number of soil, plant, and climatic factors.

The suitability of a site is a function of the physical, chemical and mineralogical characteristics of the soil as determined by laboratory analyses and site considerations for each field. Consideration is given to texture, cation exchange capacity, (CEC) available micro- and macro-nutrients, soil pH, and any other soil properties which will influence application rates. Other factors to be considered are: landscape features (e.g., slope), proximity to surface and ground water, as well as soil parent materials, density and moisture holding capacity.

Sludge which is to be land applied must be classified as non-hazardous by the extraction procedure (EP) toxicity test as defined in the Federal Register (Part 261, sub-part c, pars. 261.20 - 261.24.) Land applied sludge must also be stabilized to reduce pathogen content and to make it more biologically inert; this is best accomplished by digestion (aerobic or anaerobic), composting or lime treatment.

Solids content of sludges varies from batch to batch, with composition data evaluated on an oven-dry solids basis. The following parameters are required to develop recommendations for application rates on agricultural soils: percent solids, total nitrogen (N), ammonia (NH_3), nitrate (NO_3-N), phosphorous (P), potassium (K), copper (Cu), zinc (Zn), nickel (Ni), lead (Pb), and cadmium (Cd).

Established principles of crop yield goals, soil testing and fertilizer recommendations are used in conjunction with sludge characteristics to determine suitable application rates. The annual rate of sludge addition is usually based on meeting the nitrogen requirement of the crop to be grown, which avoids leaching of nitrate-nitrogen into ground water. Entry into the human food chain is prevented by restricting cumulative addition of heavy metals (Cu, Zn, Ni, Pb, and Cd) to amounts well below phytotoxic levels. In addition, maintaining the soil pH prevents plant uptake of these metals. Thus, a well-managed agricultural site has the potential for repeated sludge application, depending upon the most limiting metal factor.

Complete record keeping is essential to a well-managed land application system. Representative composite sludge samples are analyzed regularly for nutrients, heavy metals, and other parameters. These analyses are used to calculate the amounts of various sludge components being applied to each site. Complete and accurate field records of gallons applied, dates and fields utilized are essential to these calculations. Besides reporting to regulatory agencies, a sound land application program maintains contact with the farmers involved in the program. The application of sludge is integrated into their fertilizer programs to insure its continued agronomic success.

Mr. ROE. Please proceed.

TESTIMONY OF PANEL CONSISTING OF LARRY SILVERMAN, EXECUTIVE DIRECTOR, AMERICAN CLEAN WATER ASSOCIATION; STEVE CAMPBELL, BIO GRO SYSTEMS, INC., ANNAPOLIS, MD.; JOHN A. O'NEAL, VICE PRESIDENT, AD+SOIL SERVICES, INC.; & GROVE TEATES, N. GROVE TEATES & ASSOCIATES, INC.

Mr. SILVERMAN. Mr. Chairman, thank you for this opportunity to testify.

My name is Larry Silverman. I am executive director of the American Clean Water Association. I will be very brief. You have our written statement.

Our association occupies a middle ground between environmental organizations and business groups. We are part of the environmental lobby, most of our members are business or municipal people. We are strong supporters of clean water and tough regulation, and also we are very concerned about the costs of things. We do believe that with better technology and better approaches to financing and management we can have very high standards, fishable, swimmable waters at a reasonable cost.

I have set forth in my testimony some of our positions, and I would ask, with the chairman's permission, to elaborate on that in the next week or two, some of the other issues that may come before the committee.

But the subject before us today, the one we would like to bring this committee's attention to, is sludge management. As you know, Mr. Chairman, the Senate passed a rather comprehensive or at least lengthy provision on this subject and I believe it is accurate to say that they did not hear from anyone in the sludge management industry. I knew that this committee, when its attention was brought to this fact, would respond in a different way. I very much appreciate this opportunity.

The three gentlemen we have here represent three of our members and I think they are three of the more responsible people in this business. They are very familiar with the real problems and difficulties of appropriate sludge management, and I think they understand how to do it safely. Although they each have a different approach, what unites all of our members is the belief that sludge is not a disposal problem. That is not something to get rid of but that really, if properly managed and produced, is an asset. These are all three asset managers.

I would ask permission, Mr. Chairman, to reverse the order of the program and have Mr. Grove Teates of N. Grove Teates & Associates, Inc. of Wheaton, Md., testify first, followed by Mr. O'Neal and the Mr. Campbell.

Mr. ROE. No objection, so ordered.

Suppose we hear from Mr. Teates.

Mr. TEATES. Thank you, Mr. Chairman and members of the committee, for the opportunity to talk with you.

My name is Grove Teates. I am a principal in N. Grove Teates & Associates, Inc., and a consultant to States and municipalities who produce sludge, and particularly, compost which is made of that sludge. I work to establish marketing programs for compost. We

design, install, and operate programs for compost producers for a period of time before they are turned over for the client to operate.

There are various processes by which acceptable sludge may be made into compost. Composting of sludge makes it easier and cheaper to handle, and socially acceptable. In the mind of the consumer, compost has pleasant connotations when one is considering putting it on lawns, gardens, flower beds, et cetera. I have with me samples of compost that are produced by both Ohio and Maryland programs. I believe you have samples also. The compost from Maryland is richer because the sludge comes from the Capitol Hill area. You can take it home to your wife to show that you came to work today, or give it to the person that you think has everything.

This compost is sold in both States. The sales organizations in both locations do have good public acceptance. The older program in Maryland sold approximately $150,000 worth of compost this year to date. This compost is produced by the Maryland Environmental Service under contract to the Washington Suburban Sanitary Commission. Additionally, Maryland Environmental Service has handled more than 20,000 cubic yards of compost that is produced at Blue Plains by the District of Columbia government. Compost from such locations is sold to municipal governments, to landscape contractors, homeowners, and others who desire a rich humus product.

The material from the city of Columbus, Ohio, is similarly distributed. Considerable amounts of the product have been distributed into the Central Ohio area for greenhouse, golf course, and grounds maintenance uses.

Public acceptance in both locations has been excellent. There is an initial period in which public education is paramount and, after that, it is at times difficult for production to meet the demand. Generally, compost is priced so that it is an excellent value for the customer when he purchases it. It gives visible and pleasing results in locations where it is used. Commercial customers use it because it is safe, sure to make them look good, and inexpensive.

Compost is advertised in radio, television and newspaper media. Its message is carried to the general public and to commercial interests at various shows, demonstrations, and through university grant work. The U.S. Department of Agriculture, through its research, has done considerable work in promoting its usage as well as doing some of the early developmental process work.

Compost sales and distributions are hindered by the lack of Federal regulations which would distinguish between clean sludges, which may be made into compost for unlimited distribution or compost for nonfood chain applications, and sludges which would be permit approved. There presently exists a 1979 USDA guidelines on the use of sludge compost, and a 1981 USDA, USEPA, and USFDA guidelines of municipal sewage sludge utilization. It must be emphasized that these are guidelines only. Guidelines are not regulations and State officials tend to be afraid of making a decision based on guidelines. Their indecision unnecessarily slows and makes more costly the process of taking the product to market; indeed, it may retard the decision by local officials to even make the product. There must be a decision on the part of the Federal Government to establish such regulations in this area.

The second area of concern is the non-uniformity of regulations that exists between States. There are different rules between Maryland and Virginia; compost which may be acceptable in one State is not acceptable in another. Permits for the same product may be required in one area and not in another. It is very confusing. Application rules are different in different areas.

There needs to be a uniform set of rules for all States, based on sludge quality, application, and soil type. Thus everyone would know the rules of play—the local authorities as well as the commercial interests that are applying sludge, marketing compost, or making products from either. Once the rules are known, the costs to all parties decreases and the sludge disposal problem diminishes.

The guides must be practical—one governmental writer proposed several years ago that compost could not be distributed without permit if it contained more than 2½ parts per million of cadmium. Everybody worries about cadmium. This is almost impossible to achieve in many areas, and further, the stated levels of cadmium were much lower than those that exist naturally in the native soils of many areas. It makes little sense to have a limit which could prevent good native topsoil from being sold through topsoil dealers. That is what this individual was doing. This proposal was impractical.

I feel that sludges should be classified, broadly—if the sludge is clean, as determined by known standards, then the resultant compost and other products from that sludge should not have further regulation for general distribution. It is estimated that 40 percent of all sludges nationally would fall into this category—that represents a considerable pile of material. The remainder of the available sludges may continue to be regulated by their composition and by the particular utilization that is proposed for them. Such a position, on the part of the Federal Government would greatly aid the local authorities in determining if their product may be used for general distribution or if it must be regulated by the permitting process. This first step of ranking sludge by quality would ease their load, and let the participants engaged in the sludge disposal problem know what is expected of them, regardless of their location.

In a nutshell, our problem is that the State people are not familiar with the regulations about compost and do not know what to do with it, and they are afraid to take a position. It usually wastes between 6 months and 1 year, waiting on these people, before we can go in and implement a meaningful distribution program.

Thank you for your attention and for this opportunity.

Mr. ROE. Thank you.

Mr. O'Neal.

Mr. O'NEAL. Mr. Chairman and members of the committee, I am John O'Neal. I am the vice president of AD+SOIL Services, Inc., West Chester, Pa. I think we all sit here and watch you chuckle and make comments, and we can hear them behind us also, on the little bag of product that was given to you. We had a discussion on the way over as to the polite terminology for the business that we are in, and one of the ways that we can let our mothers tell people what we do. We are surveyors of poop.

AD+SOIL is one of a growing number of professional sludge management firms that have responded to the increased demand for environmentally correct and economically feasible sludge disposal alternatives.

The description of professional sludge management firms refers to the type of personnel employed to see that the environmental concerns in sludge utilization are addressed and responded to properly. AD+SOIL currently employs degreed agronomists, engineers and environmental scientists to insure that environmental impact of sewage sludge utilization is beneficial. The "haulers" and "dumpers" of sludge are no longer well received by either municipalities or industries.

AD+SOIL is one of many sludge management firms that have taken an entrepreneurial approach to solving municipal and industrial sludge problems. These firms have recognized the resource value of sludge and used their professional personnel to develop programs to get the product from the producer to the consumer.

The basic product under discussion today has been around for quite some time, and it has been used for about the same amount of time. The perspective from which I will develop my comments will be that of sludge utilization.

Sludge has been used in agriculture for a very long time. Farmers worldwide have viewed human manure as simply another manure to be used to maintain soil fertility. Historically, sewage treatment plants have made their sludges available to nearby farmers. Farmers were more than willing to transport this manure to their farms to be used as a fertilizer.

As urban areas grew, perhaps the municipality was required to pay the farmer something to offset his transportation costs, but the demand for the product has continued. As recently as 15 years ago, sludge by the truckload was available from the District of Columbia Blue Plains Sewage Treatment Plant. The number of available truckloads was much smaller than today, however.

Although most farmers were not aware of the chemical analysis of the sludge they used, they did observe that crops responded to the addition of sludge. Analyses that are now required for both professional agricultural management and to meet regulatory requirements reveal why crops responded as well as they did. As I have shown in my figure A, Blue Plains digested sludge applied to corn land has a value to the farmer in excess of $350 per acre.

[Figure A follows:]

AD+SOIL

Constituent Loadings

for

Blue Plains Digested Sludge

Injected for Corn

18 Dry Tons/Acre

Nutrient	lbs/ac	Unit Cost	Value
Nitrogen			
Available	185	$ 0.25/lb	$ 46.25

Lead (500)	8.1		
Nickel (125)	2.2		

(Values in parenthesis are limits for total metal addition for soils with CEC's less than 5 based on EPA recommendations.)

Figure A

Mr. O'NEAL. With the environmental awareness that developed in the 1960's and 1970's came two situations which required that more effort be directed toward sludge management: The first was the scientific questioning of the constituents of sludge and what their impact on soil and the rest of the environment would be. The second was the dramatic increase in the amount of sludge brought about by the increase in the number and efficiency of sewage treatment plants.

The scientific questions were reviewed by a number of research facilities at all levels. The USDA, notably the Beltsville facility, USEPA, the land grant universities, and municipalities have done extensive research work. As a result of the research, many of the questions concerning the agricultural use of sewage sludge have been answered. The conclusion that has been drawn from these answers is that in a well-managed agricultural sludge utilization program, crops and soils will benefit and alteration of the environment will be primarily beneficial.

Using the knowledge developed in the past 10 years, most States have developed rules and regulations for the agricultural utilization of sewage sludge in their particular areas. These rules and regulations have been created through the interaction of the environmental agency, the agricultural agency including the university, the municipality, the farmers, and the professional sludge management firms.

AD+SOIL's primary experiences have been with Maryland, Pennsylvania, and Michigan. These three States have developed programs which require that very specific information on sludges, fields, crops, and culture be provided to the environmental agency for review and site specific permit issuance. All three States have developed guidelines for determining what sludges are acceptable for land applications, what soils are acceptable for land application and what crops are suitable for fertilizing with sludge.

These State directed controls on sewage sludge utilization have allowed local programs to be designed in an environmentally correct manner for municipalities and industries. Generally a land application program will be determined to be the most cost-effective and environmentally safe sludge management program.

The recognition of the resource value of sludge to the farmer by the farmer, the municipality, the environmental agencies, and the professional sludge management firms has allowed lower cost sludge management programs to be implemented. These programs benefit the farmer with reduced fertilizer costs, and the municipality with reduced disposal costs.

Further economic benefits will be seen by the municipality as the agricultural community recognizes the value of the material and is willing to pay a price for the sludge and sludge application service. Again the marketplace is at work.

What we now have in place in many States is a State regulatory system that works with the professional sludge manager and the sludge producer to insure the public that sludge utilization through land application is accomplished in an environmentally correct manner.

The Federal role has been that of research and technology transfer by the Department of Agriculture and the Environmental Pro-

tection Agency. As new information is developed, it would be desirable for the Environmental Protection Agency to be charged with the task of collecting, collating, and disseminating the information.

Federal involvement in sludge management should continue in this vein giving support to State administered sludge management programs. For those States that have not yet developed sludge management programs, the Environmental Protection Agency might be charged with seeing that such a program is implemented through either the Clean Water Act or Resource Conservation and Recovery Act.

Thank you.

Mr. ROE. Mr. Campbell.

Mr. CAMPBELL. Mr. Chairman, thank you for the opportunity to speak today. My name is Steve Campbell. I work for a firm called Bio Gro Systems. We are out of Annapolis, Md. I have got a written statement and rather than follow along that, I would just like to share some offhand comments about sludge, sludge utilization in this country.

Our company started 5 years ago. There were three men started with one pickup truck. We initially cleaned out dirty lagoons, confinement systems for agricultural production of animals and so forth. Today we operate on a national scale and we specialize in the application of municipal sewage sludges and industrial sludges to prime farmland as a fertilizer. We have completed about 30 major projects. We operate in nine States presently. We have permitted—conservative number is 70,000 acres of land of prime farmland in which we applied this sludge. Our staff right now, we have 70 employees of which 10 are soil scientists, registered soil scientists and agronomists which help us implement this kind of work. These are some representative projects in the country today that utilize sludge for an agricultural resource. I would just like to kind of give you the impact of this.

The first one is Winston-Salem, N.C. Our firm was the first one to work there in North Carolina. This program is an ongoing program right now in Winston-Salem. They have had three different companies perform the work to date.

Another city is Roanoke, Va. We started their land application program back in 1981. At one time, they had seriously considered land incineration. What made land application of sludge come into its own way in this country is that in the last 5 to 10 years many people just literally dumped it in the streams, the rivers, the oceans, and there was a hope of incineration with the low prices of oil. With the oil embargo, the cost of oil, many municipalities gave up on the idea of incinerating it, and then at that point in time the land-based alternatives became much more viable. That is one of the reasons that we have grown in the area that we have grown in.

I would like to mention the third one—the fourth one down is Appleton Papers, Pa. This is a paper mill. This is not a municipality where they had planned on burning some sludge. They found out that land-based alternatives were economically feasible.

This will give you an idea of why we have grown from where we are today. These numbers are approximate, but if you will look at what I think is most important, the cost of land application, especially in the larger plants, is compatible, competitive, much more

competitive than other alternatives. If you will look, also you will notice that for the larger plants, ocean dumping and land application are very close. There is a big movement on right now to dump the sludge in the ocean. Of course, we are opposed to that. I do not have any ships or barges in my backyard.

But if you take another look at it, I think you should look at the cost of incineration against land application. There is a big movement underfoot to burn the sludge and not only is this a direct cost to burn it, but we have a cost benefit to the landowner when he has the opportunity to use the sludge.

The other two projects I would like to mention that we do do occasionally is sludge has a beneficial use for land reclamation, and this is the strip mine areas in Kentucky, Virginia, and Pennsylvania. There is a lot of public opposition to this, but it is a source of nutrient material that can bring this land back to a vegetative state that can actually put strip mine areas back into productive farmland with the use of compost and sludge.

Another item that is starting to grow in this country is the use of municipal sewage sludges as natural fertilizers for forestry products. The actual growth of trees, silviculture. This is just a process and an approach that is beginning to grow in its own way just in the last 2 to 3 years.

The positive effects of utilizing municipal sewage sludges, one, it brings the nutrients back into the soil. These nutrients are used to produce crops; by bringing the sludge back to the soil, you bring the nutrients back to the ground again, it can be used to produce future crops. Believe it or not, the application of municipal sewage sludge with the organic matter in it can reduce soil erosion, and a good example is this:

If you take a china plate and drop water on it, it will run off. This is what has happened to our farmland. The upper layer of the organic matter has left, it has been leeched and blown away with erosion. Sludge has organic matter in it and a little sludge on top of the ground actually acts as a sponge, it absorbs water and reduces the impact of surface runoff.

The benefit to the farmers is that the farmer can actually save money in his crop production by utilizing sludge as a natural resource for the nutrients. It also improves the soil properties from another effect that by having the organic matter applied to the soil, that soil can hold air and water better, and this will also increase crop growth.

The negative effects of using municipal sewage sludge, really the biggest one, is the lack of public acceptance. We find that the research is there, the facts are there, but the public does not accept sludge very well because they are afraid of it, because of other hazardous waste problems in that State. We find that one of our biggest jobs is educating the public that sludge can be managed in a safe manner.

The esthetic concerns of the community, the biggest thing that people do not like in communities is truck traffic. They are really concerned about people hauling tons and tons of poop out in their community and they do not like the truck traffic. You can manage an agricultural program to minimize that. Other nuisances are odors and just sludge that looks like black maple sirup. People do

not like to see it spread on the nice green farm countryside, but you can work around these problems and implement a good program.

When we look at sludge, what we have to consider in a land application program for municipality or any community, one is the sludge quality. It has to be low in metals. Has it been properly stabilized? Another item is how far do you have to haul it from that plant to get it on farmland? Is it economical to do that? Another problem is storage. When you spread sludge on farmland as a fertilizer, you cannot put it on the land when it is raining, snowing, and inclement weather. Therefore, you have to be able to get on that ground in limited times of the year. So it is necessary for the municipality to have storage.

One of the problems here in Washington, D.C., and Blue Plains has only about 3 days storage capacity.

Public acceptance. Again you have to have an active public relations program to be able to explain the facts to people, and you also need the support of the State agencies and the State universities. These are what the communities look to for help and guidance.

The regulatory framework is a consideration. It is amazing how many different States approach sludge from different ways and what their requirements are. Some States, Virginia, for instance, has a good set of sewage guidelines that you can operate by. You go to some of the Midwestern States, you do not know what—it is a crapshoot out there. When you try to get rid of municipal sewage sludge out there, you have no idea how you are going to get rid of it and what the regulations are. We have got the Federal guidelines in place right now. It is time to make the States at least put some guidelines into effect.

When you get a permit to put the sewage sludge on farmland, what we look at really is an operational design, it is an overall program of how the program is going to be implemented. We locate the sites, these are prime farmlands. We then analyze the sludge, we analyze the soil to see what is in the soil. At that point in time, we come up with application rates so that a farmer can decide how much sludge he needs to put on to grow his crop, whether it is soybeans, corn, wheat or whatever. We map the land, we submit all this information to the regulatory agency. Once that is done, they then issue us a permit for that site. It is on a site specific basis, and that is the best way to handle sludge in an agricultural program.

Economic benefits to farmers. Again we are back to the recycling, reutilization of a resource. While I was sitting here today, I heard the word ocean dumping. There is a big move underfoot right now to ocean dump sludge from Philadelphia, New York. It is going on. Let us use Blue Plains, for example here, Washington, D.C. This sludge is not a liability. It is an asset. Right now, very conservative numbers, the sludge generated at Blue Plains, Washington, D.C. has a value to a farmer of about $3.50 a ton. It is worth that kind of money to him. On a daily basis, at Blue Plains, it produced 1,800 tons of sludge a day, that is $6,000 a day. It is roughly $2.4 million a day that material is worth to the agricultural community. I think it is a shame and a disgrace to put it on a boat, take it out and dump it in the ocean where nobody receives a

benefit from it. It takes management to do it and it can be done. Ocean dumping is the easy way out, but it is not the best way out.

Just briefly, for a farmer, we reduce his fertilizer cost and lime costs. We increase the organic matter in the soil. The other thing is by this net savings to the farmer, he is able to have other funds available to have a complete fertilizer program which will then increase his optimum yield and produce a better quality grain out in the field.

This will give you a value in dollars and cents, and this is extremely conservative. I have left the micronutrients out to the farmer. Take a farmer who takes sludge to the Eastern Shore of Maryland or Virginia from Blue Plains. He can save himself, and it is worth a dollar value without the micronutrients, $166.50 per acre. You take the farmers over on the Eastern Shore of Maryland who are farming anywhere from 600 to 1,800 acres of land, you are talking about a lot of money to an agricultural economy that is in trouble today.

We have some recommendations that we would like to leave you with. One is I would like to make the comment that the recent problems that we have here in the public eye with the EPA did a number on this business. The last 3 years we spent hours, days, and months with public relations trying to explain to the communities that sludges can be handled in a safe way that is beneficial to the community. We used EPA and Federal guidelines, and when things fell apart at the EPA here in Washington in the last 3 months, we lost a lot of credibility in the communities that we work in. It had a real impact upon this business.

Now, when I stand up and show someone an EPA manual about all the guidelines, they have very little faith in me or the EPA, and I hope this body of politicians can help take care of that problem and put a little first aid on the wound in the years to come.

The second thing we would like to suggest is that the Federal Government actively enforce pretreatment guidelines and encourarge the States to have the pretreatment guidelines. What goes in a plant is what comes out the back end of the plant. Insecticides, pesticides, hazardous wastes go in the front of the systems. Sludges come out that have to be handled like hazardous waste. The best place to go is right back to the industrial people to put these toxic wastes in the municipal systems.

Another thing that is important is that—and I will give two examples. One is Richmond, Va., and the other is Hampton Roads, Va. Hampton Roads, Va., has done about 3 years in planning to get rid of their municipal sewage sludges. They will now have a good land application program going that will be of benefit to the community.

Richmond, Va. has never acknowledged the need to get rid of their sludge. They have dumped it here, they have dumped it there, and they now have a real problem with getting any acceptance in the community. What is important is that for a community and those who are going to produce sludge is to have a long-term goal and a long-term plan to get rid of it.

One other thing that we think is important to bring to point here to this group is that I heard today, by reducing the discharge limits on municipal plants, how this was going to help businesses in that

20-955 O—84——119

city. Well, one other thing should be taken into effect. When a plant increases its standards, there are economic interests that gain from that. Equipment has to be sold to the plant, people have to be hired to manage the plant, and there are other people who have to gain from standards being maintained and not relaxed.

For instance, Memphis, Tenn. You reduced their standards, they produced less sludge. I have less sludge to haul, and the farmer has less sludge to put on his land and his production—his cost of production can go up. So the economics swings both ways in this instance.

The last thing that we would like to ask is that this group encourage the Federal Government to continue support to the U.S. Department of Agriculture for the research that they have promoted in the utilization of sludge and compost. Their funds have been restricted. These people right now who have done so much for the industry do not have the funds to operate on. Their staffs have been reduced and they are not able to continue to provide the information that is necessary to keep the industry going and solve the problems in a safe environmental fashion.

Thank you.

Mr. ROE. We want to thank you very much, Mr. Campbell, Mr. O'Neal, and Mr. Teates.

How about you, Mr. Silverman, anything else?

Mr. SILVERMAN. Just to summarize, on the subject of regulation you heard a lot of talk about over-regulation. There is also a problem of under-regulation. This industry is affected by both and I think we have to strike—we have to have a clear reliable decision-making process. And that is what is lacking now and I believe some of the proposals that are before the Congress would make that a worse situation.

Second, the pretreatment is critically important. We cannot handle the hazardous waste that we will be producing and is produced because of lack of treatment and it is just time to get on with that job. I cannot think of anything more important in this field.

The present system may not be perfect, it certainly is not—has many failings. But at least it is in place and it is ready to move forward and I would just like to see us proceed forward.

I put some comments in my testimony, the finances. Mr. Goldman from our—Arthur Young, a member of our Association testified about one alternative in finance. We would like to see a lot of alternatives in the finance plans made. And so I am pleased with this Committee's interest in increasing the grants fund. I am a little concerned that there is no congressional policy in this area. Say this Committee increases grant funds and then Ways and Means diminishes some tax benefits or OMB restricts Farmers' Home loans and the net result is you have not accomplished anything. And I do not know how it would achieve it but there definitely is a need for some kind of congressional leadership in the funding of water and sewage systems.

Thank you.

Mr. ROE. Let me ask you this. Is there some national organization that has been established in your field, particularly?

Mr. CAMPBELL. No, sir, there is not. Quite frankly, this gentleman beside me, John O'Neal and myself, we have the two largest privately owned companies in I would say in the country that specialize in this. And it is a business that we both believe it is a coming thing. We found the greatest thing in the world, we are going to recycle sludge and everybody has gotten on the bandwagon. It is a very competitive business and at the same time there is not a national coalition at all. We are fairly independent.

Mr. ROE. What do you do, go and negotiate with different sewage agencies and so forth?

Mr. CAMPBELL. Primarily we try to respond to bids from municipalities. They put this work out to bid, to dispose of the sludge.

For instance, if a city does not have a planned way to get rid of it, let us say Washington, D.C., just use that as an example, they may say we are taking proposals to get rid of our sludge. Someone may come in with composting, someone may come in with incineration, someone may come in with ocean dumping, someone may come in with land applications for agricultural reuse. Some municipalities will say we are going to go to land application or we are going to go to incineration. Some will take an RFP and which one is the most economical will be the way they would like to go.

Mr. ROE. Well, that will be based on the purely economic practice.

Mr. CAMPBELL. Exactly. And that is the reason we have grown.

Mr. ROE. But in other words, if you are in a position where the utilization of the product with an application as has been discussed by all of you is available in that marketing region, you should be able to come in with a lower bid. Is that a reasonable point to make?

Mr. CAMPBELL. Yes, sir.

Mr. ROE. So it is less costly to do it, to reuse the resource rather than destroying it by incineration or whatever?

Mr. CAMPBELL. Exactly. And one other comment that I would like to share here is that it is a shame that EPA funds are available to these municipalities. I will give you a good example. And these were not EPA funds, but many plants are land application programs. The equipment is bought with EPA funds. For instance, Hampton Roads, Va., recently put out a two-tier bid. One, we will provide all the equipment and you manage the sludge disposal for this jurisdiction.

Two, you provide the equipment and the management and do a turnkey program for us.

They found on a competitive proposal it was cheaper to have private enterprise take care of the whole program and right now we have to go out and compete with cities who get these tax dollars to buy all the equipment and the hardware to get rid of the sludge. And I guarantee you right here there is not a city that can compete with me as far as cost effectiveness to get rid of the material. And we are literally competing with our own tax dollars that we pay to some of these municipalities to even develop this industry further.

Mr. TEATES. Sir, I think there is another element that needs to be approached.

I have yet to run into a municipality or government entity that can move with the rapidity or speed and certainty that the private sector does. And sometimes in this business it is very important to be able to make a decision today and in 10 minutes implement that decision and go with it.

Mr. ROE. I think you are striking upon a number of points this morning. I think that the sludge issue is perhaps one of the greatest ones we are faced with because it triggers a whole host of other things. You have all spoken to that issue vis-a-vis whether it be ocean dumping or whatever the case may be.

I think you are making a good point that there is a lack of knowledge and a lack of acceptability as far as the American people are concerned because they do not understand this issue; they think it is a dirty thing, that it has to be hidden under the—if you will pardon me, the rug or whatever, at this point.

So I think that that is a valid situation.

What concerns the committee, of course, is the fierce problems we have in the pretreatment issue. That is where it all stems from. In fact, we had good testimony yesterday of some of the witnesses who spoke to the issue that the way to solve the toxic input in the main or in large measure would be to correct it at its source rather than let it go.

Now, let me ask you this question, having said that. When someone puts a bid out for different people to bid on, different types of utilization or destruction of sludge, do you, before you enter that bid, test that sludge out? Do you understand what is in it?

Mr. CAMPBELL. Precisely, and we found several things. One is some municipalities do not want to tell you what is in the sludge so you are kind of at your own risk. You can take their analyses and accept it.

What we do for our internal protection is we sample all sludges that are to be hauled and disposed of and make sure that they are not hazardous and that they meet the Federal guidelines and the criteria set forth by that State in compliance to the land.

Mr. ROE. Well, that goes back to the testimony by the gentleman from Memphis, Tenn., when he spoke to the issue about letting everybody decide their own thing. In other words, there are two schools of thought. Does big brother do it all; namely, the Federal Government? Or do we go back and say, well, OK, States, you have the responsibility and obligation. Why not do it at the State level?

And then you determine what the quality of the sludge will be and what you are going to do with the sludge and so forth and so on.

In other words, when you have a situation like that, then everybody is walking to their own drummer at that point. So do you think there ought to be some kind of national standards that are established? I think somebody testified to that.

Mr. CAMPBELL. I think so, and I think the important thing is to have—one of the problems right now about sludge and the disposing of sludge is that there is a tremendous wealth of information and research about it, documentation. And many States do not even know that it exists. And our suggestion is——

Mr. ROE. You mean the information?

Mr. CAMPBELL. Yes, sir. Correct. And one of the things that we think——

Mr. ROE. I am getting even, because they know the sludge exists. But go ahead.

Mr. CAMPBELL. OK. The important thing is that we believe Federal guidelines should be established and we call them guidelines. I think it is wrong to tell a State exactly what he has got to do with a kind of sludge. Because for instance, in different geographic areas the land itself has different considerations. The people in Washington, it is very difficult for them to say you get rid of a certain kind of a sludge a certain way and Richmond, Va., when you have different kinds of crops, different kinds of soils, et cetera, et cetera.

So what we believe is that the Federal Government should really work hard to provide the information to the States that is there now, based on good research. And then tell the States you have guidelines in place by certain dates.

One of the problems is we operate in 13 different States right now. One of the problems is, for instance, I can go to Virginia and they have exact guidelines that I have to follow, all municipalities have to follow. You go to Oklahoma, 2 years ago we started in Oklahoma, they had no regulations about land application and they are still trying to put them together. And the information is there if the people will at least go look at it.

The USDA has got more information than EPA, probably than anybody else.

Mr. ROE. Well, I am taking more time than I meant to. Let me just ask you two questions.

I think that, No. 1, the citizen does not understand the retrievable value of the resource. They consider it to be a waste to dispose of it and get rid of it. And the whole body of testimony in the main is directed to the methodology of safely getting rid of the sludge rather than coming back and saying this is a great national asset, it is being wasted or destroyed, just like they used to top off oil wells when they burned the gas. They did not use it. Therefore, rather than go perhaps in the direction you are thinking about, would it not be a good idea that if the grant eligibility is to be maintained, that part of the application that the applicants submit to the Federal Government before it can be funded must have a program for the optimum or whatever disposal of that sludge?

Mr. CAMPBELL. And public acceptance. One of the problems——

Mr. ROE. If the gentleman would yield, you are not listening to me. I am trying to come out and say the following, that there is no mechanism that provides incentive. Do you follow what I am trying to get at?

Mr. CAMPBELL. Right.

Mr. ROE. So it seems to me that when the municipal applicant puts in their application, they have a whole series of things that they have to do, they have to look at cost effectiveness, et cetera, et cetera, so that the determination of what that grant will be and what methodology they use in the process has to be presented and accepted. But sludge is less open in the sense that they do talk of the sludge issue but they do not list it as a possible retrievable resource with a credit against the grant. And it might very readily be that if there is innovative uses of sludge, that it should get innova-

tive incentives to go in that direction by an incentive approach rather than a penalty approach, is the point that I am trying to lead up to.

Mr. CAMPBELL. You are right.

Mr. SILVERMAN. We would support that, Mr. Chairman.

Mr. ROE. You understand what I am talking about?

Mr. SILVERMAN. Yes; I think I do.

Mr. ROE. All right.

Any questions by the gentleman from Minnesota?

Mr. STANGELAND. I have no questions. It was very interesting testimony and coincides with my thoughts as a farmer that this ought to be a prime way of getting rid of the sludge. But along that line, I think we have to be very careful that we do not improperly mix and that we have the proper kinds of sludge.

Mr. CAMPBELL. That is correct.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. Thank you, Mr. Chairman.

I spent some time in Philadelphia looking at their new southwest Philadelphia treatment plant.

Mr. CAMPBELL. I am very familiar with it.

Mr. EDGAR. The officials in Philadelphia indicated that public acceptance is the biggest problem, and you reiterated this several times today, in trying to manage their sludge problem. What are some of the techniques for public acceptance that you would suggest?

Mr. CAMPBELL. That gentleman right there, Mr. Roe, he is smoking a cigarette. The quickest way to get cadmium in your body is through smoking a cigarette.

You explain that to half the audience and you can see them putting them out out there.

Mr. ROE. We just did.

Mr. CAMPBELL. The other real problem of public acceptance is this——

Mr. EDGAR. Would you repeat that for Mr. Roe?

Mr. CAMPBELL. The other real problem with public acceptance is this, and it is—I hate to sound like a BS artist up here but the problem is this: We have EPA guidelines in effect put together by engineers and consultants. We have waste water treatment plants operated by engineers and consultants. We try to dispose of sludge with engineers and consultants. I have been in numerous public hearings where Ph. D.'s, civil engineers speak to the public and address their concerns about sludge and they are over their head before they even open their mouth. They use the terminology that the average man on the street does not understand. I will give you a good example.

I hear people complaining about heavy metals in sludge. If you take the top 6 inches of soil and you calculate the amount of heavy metals that occur there naturally, and then you calculate the amount of metals in a sludge on an annual application, there is absolutely no impact to most soils in that area. This is the kind of information that has to be explained in layman's terms to the general public and it takes a lot of time, it takes an individual who can speak and you stand in a room of 300 people who are jumping up and down and they are mad, they have never had anybody ex-

plain to them in layman's terms the pros, the cons and the hazards and the management techniques to minimize these hazards of the use of sludge.

Philadelphia's land reclamation program right now is in trouble for one reason, public relations to the western part of the State. Those people do not believe and do not understand the problems and have never had explained to them in layman's terms the potentials and the benefits of the use of sludge. It is that simple.

Mr. EDGAR. We also have the problem of 200 trucks or so every day driving all the way across the State and dumping and then driving all the way back again.

Mr. CAMPBELL. Correct.

Mr. EDGAR. I do not have any problem with their land use in reclaiming coal mines in other areas of that sludge but it does just seem a little strange to do it by truck.

Mr. TEATES. Sir, I want to address the question that you asked on public acceptance.

With compost, which we have 20,000 tons of compost within half a mile of here, you probably never knew that it went down, No. 1.

No. 2, I have probably done more video work pushing public perception as well as acceptance of compost than anyone in the Nation. I make the television ads for composts. You may have seen some in this area. Last night I just previewed a 10-minute commercial and it takes a lot of nerve to make a 10-minute commercial for anything. Nonetheless, the perception is that it is a good product because it is not sewage sludge that we are selling. We are selling a competitive product to peat moss, to other fertilizers, but this is natural, it is organic and it is good. It makes things grow.

That is where we work on the public perception as to how we even talk. I do not use the word "sludge" in my vocabulary. It is a raw material only. That way the perception is different, everything is different and it comes on in a very nice manner.

We do not have advantage that some other people have in that people can buy anything they wish in America, it is a great thing. So if they do not perceive compost, whether it is under the name of contail, whatever, well, we are out. It is that simple.

Mr. SILVERMAN. In our magazine that I handed out with my testimony, we highlighted one of our members who makes films about sludge, and particularly that western Pennsylvania problem, and we are trying to encourage people in the industry to get involved with film makers and writers, and others who can explain this thing.

The other comment I want to make about shipping, really, rail transportation, pipelines make great sense in this industry. Those are permanent installations, and it goes back to public relations problems, people do not want to have a permanent installation, so that they will resist the rail spur, or the pipeline that may be used.

Mr. EDGAR. I will have to ask Mr. Clinger whether he is for sludge slurry pipelines.

Mr. CAMPBELL. Your comment, though, is well taken in Pennsylvania, and I am sure you are fairly close to the situation in the city of Philadelphia.

One other problem is the lack of storage at municipal plants, and timing. The problem with Philadelphia is the reclamation program

in Pennsylvania is a phenomenal program, and it will work, but it is going to take time to keep it together, and that is the problem that the city does not have. They do not have the time required.

You cannot push sludge on a community, or an environment that is doubtful of it. You have to educate the public, and it has to go one step at a time. And 200 trucks is one thing they are not ready to accept right now.

Mr. EDGAR. One of the things that occurred to me in visiting the Philadelphia plant, and also listening to your testimony today, is that some effort along with the films and the public education and the commercials ought to be made in terms of teachers, and educational facilities, particularly at the elementary and secondary level. Because it seems to me, prior to 1973, all of our wastes, not just our sludge, but our hazardous wastes, were not counted into as the cost of living in a civilized society, and when we find the Love Canals and the Valley of Drums, and the thousands of other toxic disposal sites, suddenly we are shocked, that to manufacture an item, it costs us something, or to live in a society, it costs us something.

I think it would be great if we could somehow get to young people throughout the educational process, to talk to them about the value of water, the value of materials that come as a result of our waste treatment, and to increase the number of tours, not just to the Nation's Capitol, but to the sewage treatment plant, and talk about the positive aspects.

After they get done giggling about the bags filled with goop, then it seems to me that there is some value in teaching people that they have to manage that in a creative and constructive way.

Mr. O'NEAL. Mr. Edgar, if you do not mind, I will respond to that.

We worked with Philadelphia, I guess, since about 1975, and of course, Philadelphia is totally land based. You will recall that they were out of the ocean 1 year before they were mandated to.

We have gone to Delaware County, and the other surrounding counties, both for the township meetings, and we are available, and I am sure that the other two gentlemen here, and Larry also, are available to go speak to these people that you are talking about, at any level, at any time.

The second thing I would like to do is to attempt to get away from using the term waste. I think that is what all of us have done in our purveying of poop, is looking at these things as products, not as wastes, but as products, and when you are out there trying to sell, and your livelihood depends upon it, you do come up with some unique sales approaches that can convince people to put out cigarettes periodically.

Mr. EDGAR. Just a little humorously, that if we got all of our national scientists together to do some statistical analysis, to make the conformity at a national level, we could call them poop sheets.

I yield back my time.

Mr. CAMPBELL. My wife told me that any time you take two good products and put them together, they are no good. Her comment to me at the table this morning was, honey, sludge is great, sugar is great, put them together, and it is no good for anybody.

Mr. ROE. Mr. Smith.

Mr. SMITH. Thank you, Mr. Chairman.

I think the public relations point was made earlier, which I agree with. You do not call it anything but sludge. For crying out loud, it is the worst name I ever heard of. Call it grow more, or how about recycled cash, daily health, but anything but sludge.

I want to know what the cost was to the farmer, and is it competitive with other fertilizers?

Mr. O'NEAL. Well, at the moment, Steve and I have talked about this quite often. The municipalities are footing the entire bill, for all of the contracts that I am aware of, to have the sludge management firm remove the material from the plant, and apply it properly to the farm.

Now, you know the cost of farm equipment. We are talking about $120,000 to $150,000 machines to apply this to the farm. What the farmer is getting is a complete service, soil analysis, fertilizer application, lime application, and primary tillage for nothing at this point.

However, both of us also recognize, and it is in the testimony, that at some point in time the demand will be there, so that the farmer will start paying, and I think then we will get in a situation that Grove would certainly like to be in.

But at this time, the municipality foots the entire bill. No cost to the farmer.

Mr. SMITH. So you make your money on a bid to a municipality, on disposing of——

Mr. CAMPBELL. The material. Solids, we call it.

Mr. SMITH. Solids. That is not good.

Mr. CAMPBELL. No; it is not. I keep trying.

Mr. SMITH. All right, we will work on that.

But you make your money bidding to the municipality, in competition with other methods to take care of the property?

Mr. CAMPBELL. Correct.

Mr. SMITH. Without cost to the farmer. Certainly, there is such a value to the farmer. That is the whole potential.

Mr. CAMPBELL. There is a tremendous value to the farmer. You can see it in dollars and cents. We have one contract in place right now, where we are attempting, right now, and it is the first time we have done it, our business is really only developed in what I would call true hard businesses, over the last 5 years, and we have one contract with the city right now, where we are charging for the material for the sludge, and a part of that, the profits, or the moneys received, go directly back to the municipality, and I personally perceive, today, that people will pay to receive this sludge, the municipalities may get some cash from the quality of the material.

Mr. SMITH. What is the percentage of assistance to the land, say in comparison to the 200 pounds of applied fertilizer?

Mr. CAMPBELL. Well, just look at it this way.

Don, you are better at this than I am, but right now if you are a farmer, and you are farming, let us say, again you are on the Eastern Shore of Maryland, you are farming 1,000 acres of corn, I can save you, in real hard cash, today, $80 an acre in your nitrogen bill, period. That is $80,000 directly to the farmer's bottom line. That is a lot of money.

Mr. STANGELAND. That is assuming that the farmer gets that material on his land free.

Mr. CAMPBELL. That is exactly right.

Mr. ROE. Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman.

I am sorry Mr. Edgar left. I would support the sludge slurry concept, I could see us slurrying coal to Philadelphia and sending sludge back. It might be a real solution to this whole problem!

As a western Pennsylvanian, I can concur in your assessment that there needs to be a lot of work done with regard to the public's perception of what this would mean to them. There is a lot of resistance, clearly to this.

One of the things that is of great interest to me is your allusion Mr. Campbell, to the uses that have been made in the area of strip mine reclamation, and of revegetation of the strip mines. We have a lot of strip mines in western Pennsylvania, as you are aware.

How extensive is it? Have you really got any experience in terms of the utilization of sludge for strip mine reclamation?

Mr. CAMPBELL. Sure. Right now there are projects in Kentucky, western Virginia is not as far along as Kentucky has been, and in western Pennsylvania.

And, quite frankly, it is not whether does it work, is it a good thing. All those answers have been—are there. The answers are yes, yes, they have been there for the last 5 years. The real problem is public acceptance. That is it, in a nutshell.

I have walked over probably a third of the mines in western Pennsylvania, personally, that could utilize this material, either sludge or compost.

Mr. CLINGER. Does it accelerate the revegetation in the process?

Mr. CAMPBELL. It is a godsend to the mines. It really is. It is the—they can take—you take a strip mine in western Pennsylvania, which has no growth, which has acid mine seepage, you can take the material at the rates now allowed by the Pennsylvania State, you can establish growth, vegetation, you can establish grasses, it could be used to reestablish forest trees.

You, in that process, will reduce acid mine seepage, in the amount of moisture that goes down through these mines and pollutes the ground water, and it is a tremendous benefit, but the general public up there are very reluctant to accept it.

Mr. SILVERMAN. This effort has been monitored by Penn State University, and they did some of the earlier research, and they have done the investigation of the effects, and it is well documented. We have a film about that, just using sludge to revegetate strip mine lands.

It is there, and the leadership——

Mr. CLINGER. I am aware of that, Larry, and in fact, I have seen that film, and I did want to get it on the record. This is a proven technology for strip mine reclamation.

Mr. CAMPBELL. The problem is with the general public, there cannot be one hitch in the program, there cannot be one flaw in it. Because people just do not like the idea of somebody else's trash coming into their communities and to implement that program there cannot be one hitch. The contractor has to be spotless, clean, the university has to be there monitoring it, it has to have independent monitoring and testing and the city has got to see that all those things take place at one time. And the problem in western

Pennsylvania is that the contractor who managed the entire project was not squeaky clean and that is what the citizens used to bring the program to a halt. And it is a shame because it is a good program for the State.

Mr. TEATES. I want to go further with this, to put compost in mines, and we have done some of that here in Virginia. Compost, D.C. compost to be exact, took a 1.9 leach problem and it has held it at 5.6 the last 6 years, which is a significant increase as well as longevity of holding the acid leachate. Of course, you get immediate revegetation. At the same time with handling compost as opposed to sludge, you do not have a lot of the public sector problems that you do with the image as well as with some of the problems that are associated with sludge handling. So we have looked hard in West Virginia areas, particularly in shipping compost 400-some miles from Washington in West Virginia for mine work. You do not have to worry about the leachate, for example, and runoff.

Mr. CLINGER. Thank you very much, gentlemen.

Mr. ROE. Are there any further questions?

We want to thank you very much for a very interesting and very provocative presentation. We appreciate your testimony.

Mr. SILVERMAN. Thank you, Mr. Roe.

Mr. ROE. Our next witness is Mr. Robert A. Matthews, who is with the Union Carbide Corp. but his testimony is on behalf of the Chemical Manufacturers Association. We welcome you, Mr. Matthews, to our committee.

The full text of your prepared statement will appear in the record at this point.

CHEMICAL MANUFACTURERS ASSOCIATION

ORAL STATEMENT OF

ROBERT A. MATTHEWS

UNION CARBIDE CORPORATION

ON BEHALF OF THE

CHEMICAL MANUFACTURERS ASSOCIATION

BEFORE THE

SUBCOMMITTEE ON WATER RESOURCES

OF THE

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

U. S. HOUSE OF REPRESENTATIVES

ON

POSSIBLE AMENDMENTS TO THE

CLEAN WATER ACT

NOVEMBER 3, 1983

MR. CHAIRMAN, MEMBERS OF THE SUBCOMMTTEE: MY NAME IS ROBERT MATTHEWS. I AM AN ATTORNEY WITH UNION CARBIDE CORPORATION SPECIALIZING IN THE PRACTICE OF ENVIRONMENTAL LAW. I AM APPEARING ON BEHALF OF THE CHEMICAL MANUFACTURERS ASSOCIATION (CMA) TO DISCUSS POSSIBLE AMENDMENTS TO THE CLEAN WATER ACT. GIVEN THE LIMITATIONS OF TIME, I WILL FOCUS ON WHAT WE CONSIDER TO BE THE MOST IMPORTANT ISSUES BEFORE CONGRESS IN THIS REAUTHORIZATION PROCESS.

CMA HAS FREQUENTLY STATED ITS BELIEF THAT THE CLEAN WATER ACT SHOULD BE AMENDED TO PROVIDE FOR ALTERNATIVE MECHANISMS FOR IMPLEMENTING INCREASINGLY STRINGENT EFFLUENT LIMITATIONS. FOR INDIRECT DISCHARGERS, WHOSE WASTE IS FIRST SENT TO, AND TREATED BY, PUBLICLY-OWNED TREATMENT WORKS (POTWS), CMA BELIEVES THE PROPER MECHANISM IS ONE THAT WOULD AVOID REDUNDANT TREATMENT BY ALLOWING POTWS TO ESTABLISH AND IMPLEMENT LOCAL PRETREATMENT PROGRAMS DESIGNED TO ENSURE THE ENVIRONMENT IS PROTECTED, IN LIEU OF THE NATIONAL CATEGORICAL PRETREATMENT STANDARDS. FOR DIRECT DISCHARGERS, CMA BELIEVES THE PROPER MECHANISM IS ONE THAT WOULD AVOID TREATMENT FOR TREATMENT'S SAKE BY ALLOWING PERMITTEES THE OPPORTUNITY TO DEMONSTRATE THAT MODIFIED REQUIREMENTS WOULD CONTINUE TO PROTECT RECEIVING WATER QUALITY. MY REMARKS TODAY WILL SPECIFICALLY ADDRESS THE NEXT LEVEL OF TECHNOLOGY-BASED REQUIREMENTS -- THE BEST AVAILABLE TECHNOLOGY ECONOMICALLY ACHIEVABLE (BAT) EFFLUENT LIMITATIONS GUIDELINES -- WHICH HAVE BEEN, OR SOON WILL BE, ESTABLISHED FOR ALL DIRECT DISCHARGERS, INCLUDING CMA MEMBER COMPANIES.

CMA FIRMLY BELIEVES THAT CONGRESS CAN AND SHOULD CONCLUDE, BASED ON THE INFORMATION AVAILABLE TO IT TODAY, THAT BAT LIMITATIONS CAN BE MODIFIED SELECTIVELY WITHOUT COMPROMISING THE OBJECTIVES OF THE ACT. ALLOW ME TO EXPLAIN WHY CMA BELIEVES CONGRESS SHOULD REACH THIS CONCLUSION AND HOW A SO-CALLED BAT MODIFICATION PROVISION WOULD WORK UNDER THE CURRENT STRUCTURE OF THE ACT.

TWICE IN THE PAST DECADE CONGRESS HAS MADE CRITICAL DECISIONS AFFECTING THE COURSE OF THE NATIONAL EFFORTS TO CLEAN UP OUR WATERS. IN 1972, FACED WITH EVIDENCE THAT THE SYSTEM THEN IN PLACE, WHICH WAS STRICTLY A WATER QUALITY-BASED APPROACH, DID NOT APPEAR TO BE WORKING, CONGRESS MADE TWO SIGNIFICANT CHANGES. FIRST, IT ADDED THE TECHNOLOGY-BASED REQUIREMENTS THAT I REFERRED TO EARLIER. SECOND, CONGRESS ESTABLISHED A NATIONWIDE PERMIT PROGRAM TO IMPLEMENT AND ENFORCE THE WATER QUALITY AND TECHNOLOGY-BASED REQUIREMENTS.

IN 1977, CONGRESS DECIDED THAT THE FOCUS OF THE CLEAN WATER ACT SHOULD BE SHIFTED TO A NEW SET OF IMPERATIVES. ALTHOUGH THE INFORMATION WAS NOT COMPLETE OR CONCLUSIVE, CONGRESS PERCEIVED A GROWING CONCERN WITH THE EFFECTS OF TOXIC, OR PRIORITY, POLLUTANT DISCHARGES. IN RESPONSE, CONGRESS ESTABLISHED THE CONTROL OF PRIORITY POLLUTANT DISCHARGES AS A PRIMARY FOCUS OF THE ACT.

IN 1983, CMA BELIEVES THAT THERE ARE NEW FACTS AND NEW IMPERATIVES WHICH CONGRESS SHOULD ACT ON. FIRST, WE KNOW A LOT MORE THAN WE DID IN 1977 ABOUT THE EFFECTIVE CONTROL OF PRIORITY POLLUTANTS. AS REQUIRED BY THE STATUTE, BY 1977 INDUSTRY INSTALLED POLLUTION CONTROLS NECESSARY TO COMPLY WITH THE FIRST ROUND OF TECHNOLOGY-BASED REQUIREMENTS -- THE BEST PRACTICABLE CONTROL TECHNOLOGY CURRENTLY AVAILABLE (BPT). THESE CONTROLS HAVE REMOVED LARGE QUANTITIES OF POLLUTANTS, AS EVIDENCED BY EPA AND INDUSTRY DATA. FOR EXAMPLE, THE DATA IN THE 1982 CMA/EPA FIVE-PLANT STUDY DEMONSTRATE THAT HIGH RATES OF REMOVAL OF ORGANIC PRIORITY POLLUTANTS ARE ACHIEVED BY THE KINDS OF WELL-DESIGNED AND WELL-OPERATED BIOLOGICAL TREATMENT SYSTEMS THAT WERE INSTALLED TO MEET BPT. ATTACHED TO MY WRITTEN STATEMENT ARE ADDITIONAL DATA FROM SEVERAL UNION CARBIDE PLANTS WHICH EMPLOY BIOLOGICAL TREATMENT AND WHICH HAVE ACHIEVED REMOVAL EFFICIENCIES OF 99% AND ABOVE FOR THE MAJORITY OF PRIORITY POLLUTANTS.

IN TESTIMONY BEFORE THIS SUBCOMMITTEE LAST YEAR, THE BUSINESS ROUNDTABLE PRESENTED DATA INDICATING THAT INDUSTRIAL POINT SOURCES CONTRIBUTE A RELATIVELY SMALL PORTION (3 TO 10%) OF THE NATIONWIDE DISCHARGE OF PRIORITY POLLUTANTS TO SURFACE WATERS. AS A RESULT OF BOTH THIS RELATIVELY LOW LEVEL OF CONTRIBUTION AND THE HIGH LEVELS OF PRIORITY POLLUTANTS REMOVED THROUGH BPT, THE BUSINESS ROUNDTABLE DATA INDICATE THAT THE IMPOSITION OF BAT WILL ACHIEVE ONLY AN ADDITIONAL 2-3% REDUCTION IN THE NATIONWIDE DISCHARGE OF PRIORITY POLLUTANTS.

IN ADDITION, WE HAVE GAINED CONSIDERABLE EXPERIENCE WITH A PERMIT PROGRAM WHICH ALLOWS THE FEDERAL AND STATE AGENCIES TO EFFECTIVELY ENFORCE EFFLUENT DISCHARGE LIMITATIONS DERIVED ON THE BASIS OF EITHER TECHNOLOGY OR WATER QUALITY.

FINALLY, WE HAVE SIGNIFICANTLY IMPROVED OUR ABILITY TO ASSESS THE PRESENCE AND IMPACTS OF PRIORITY POLLUTANT DISCHARGES IN AND ON RECEIVING WATERS. WE CAN NOW DETECT SUCH POLLUTANTS IN EXTREMELY SMALL QUANTITIES. TOOLS SUCH AS BIOLOGICAL MONITORING ARE NOW AVAILABLE AS SCREENING DEVICES TO IDENTIFY AREAS WHICH MAY BE DISCHARGING TOXIC POLLUTANTS IN TOXIC AMOUNTS.

THESE ARE THE 1983 FACTS. LET ME NOW DESCRIBE WHAT CMA BELIEVES ARE THE 1983 IMPERATIVES.

ALL OF INDUSTRY MUST NOW INSTALL BAT. IN THE CASE OF PRIORITY POLLUTANTS, THEY MUST DO SO WITHOUT REGARD TO THE HIGH RATES OF REMOVALS THEY ARE CURRENTLY ACHIEVING. MORE SIGNIFICANTLY, EACH PLANT MUST INSTALL BAT WITHOUT REGARD TO WHETHER THE ADDITIONAL CONTROLS WILL PROVIDE ANY ADDITIONAL PROTECTION TO THE RECEIVING WATER QUALITY.

CMA BELIEVES THAT THE CLEAN WATER ACT SHOULD CONTAIN A MECHANISM TO ALLOW PLANTS TO DEMONSTRATE THAT MODIFICATION OF THE BAT REQUIREMENTS WILL NOT CREATE A RISK OF HARM TO THE RECEIVING WATER QUALITY. WE BELIEVE THAT THE USE OF SUCH A

MECHANISM WOULD BE LIMITED, BUT WOULD AT LEAST PROVIDE A PLANT WHICH FACED A COSTLY BAT REQUIREMENT WITH THE OPPORTUNITY TO PRESENT EVIDENCE THAT MEETING THOSE REQUIREMENTS WOULD NOT RESULT IN A DISCERNIBLE WATER QUALITY BENEFIT.

LET ME ILLUSTRATE THIS CONCERN BY WAY OF A BAT-RELATED PROBLEM FACING ONE OF UNION CARBIDE'S PLANTS. THIS LOCATION CURRENTLY DISCHARGES, ON THE AVERAGE, 0.5 LBS/DAY OF PHENOL. IN ORDER TO ACHIEVE (ON A CONSISTENT, ENFORCEABLE BASIS) THE PROPOSED BAT PHENOL LIMITATION APPLICABLE TO IT, THE PLANT BELIEVES IT WILL HAVE TO DESIGN AN ESSENTIALLY ZERO DISCHARGE SYSTEM FOR PHENOL. THIS, THE PLANT HAS ESTIMATED, WILL REQUIRE A CAPITAL INVESTMENT OF OVER $2 MILLION.

WILL THE RECEIVING WATER BE BETTER PROTECTED IF THE $2 MILLION IS SPENT? IF THE ANSWER IS NO, THIS IS TREATMENT FOR TREATMENT'S SAKE. UNFORTUNATELY, THE CLEAN WATER ACT DOES NOT ALLOW THE ISSUE TO BE RAISED. CMA BELIEVES IT SHOULD. THE ACT SHOULD BE AMENDED TO ALLOW A PLANT TO DEMONSTRATE THAT A MODIFIED BAT PROVISION WILL SATISFY ALL WATER QUALITY REQUIREMENTS, INCLUDING THE PROTECTION OF THE DESIGNATED USE OF THE RECEIVING WATER.

MY WRITTEN TESTIMONY CONTAINS A DETAILED ANALYSIS OF HOW A BAT MODIFICATION PROGRAM WOULD WORK. I WILL NOW HIGHLIGHT CERTAIN ASPECTS OF THE CMA PROPOSAL. FIRST, THE ENTIRE BURDEN OF GENERATING THE INFORMATION TO BE CONSIDERED IN A MODIFICA-

20-955 O—84——120

TION REQUEST, AND OF DEMONSTRATING THAT THE PLANT QUALIFIES FOR A MODIFICATION, WOULD BE ON THE PERMITTEE. SECOND, THE MODIFICATION PROCESS WOULD BE ON A POLLUTANT-BY-POLLUTANT BASIS. THAT IS, THE PERMITTEE'S BAT REQUIREMENTS COULD BE MODIFIED ONLY FOR THOSE SPECIFIC POLLUTANTS WHICH THE PERMITTEE DEMONSTRATES MEET THE MODIFICATION CRITERIA. THIRD, A SUCCESSFUL BAT MODIFICATION DEMONSTRATION WOULD NEVER RELIEVE THE PERMITTEE OF MEETING THE BASELINE BPT AND WATER QUALITY-DERIVED LIMITATIONS. AND FINALLY, THE GRANTING OF A BAT MODIFICATION REQUEST WOULD NOT BE CAST IN STONE. ADDITIONAL MONITORING IMPOSED AS A CONDITION OF THE MODIFICATION COULD GENERATE INFORMATION INDICATING THAT THERE WERE, IN FACT, UNREASONABLE RISKS OF HARM IN THE RECEIVING WATER. OR, A STATE COULD UPGRADE THE DESIGNATED USE OF THE RECEIVING WATER. EITHER OF THESE SITUATIONS COULD RESULT IN THE WITHDRAWAL OF A BAT MODIFICATION. ACCORDINGLY, WE BELIEVE THE ACT SHOULD ALLOW A MODIFICATION OF BAT LIMITS IN APPROPRIATE SITUATIONS TO AVOID TREATMENT FOR TREATMENT'S SAKE.

FINALLY, LEGISLATIVE PROPOSALS IN BOTH THE HOUSE AND THE SENATE HAVE INCLUDED A SO-CALLED "POST-BAT" PROVISION. FOR A NUMBER OF REASONS, CMA BELIEVES THESE PROPOSALS SHOULD NOT BE ADOPTED AT THIS TIME. THE PROPOSALS ARE PREMATURE SINCE BAT HAS NOT BEEN IMPLEMENTED. INDEED, FOR MANY INDUSTRIES, BAT HAS NOT YET BEEN DEFINED. THE PROPOSALS WOULD ALSO FUNDAMENTALLY ALTER THE TRADITIONAL WAY IN WHICH WATER QUALITY STANDARDS HAVE BEEN DEVELOPED AND IMPLEMENTED BY TAKING FROM THE STATES THE

AUTHORITY TO SET SUCH STANDARDS. HOWEVER, CMA DOES AGREE WITH ONE OF THE ASSUMPTIONS WHICH FORMS THE BASIS FOR THESE PROPOSALS. THE POST-BAT PROPOSALS ASSUME THAT THE SCIENTIFIC COMMUNITY CAN NOW, ON A SITE-SPECIFIC BASIS, IDENTIFY WHERE WATER QUALITY PROBLEMS EXIST. THIS SAME ASSUMPTION CAN BE APPLIED TO THE BAT MODIFICATION PROPOSAL. THAT IS, THE SCIENTIFIC COMMUNITY CAN DETERMINE, WITH SUFFICIENT PRECISION, WHERE WATER QUALITY PROBLEMS DO NOT EXIST AND THEREFORE, WHERE ADDITIONAL EFFLUENT REDUCTIONS ARE NOT REQUIRED TO PROTECT THE WATER QUALITY.

FOR ALL OF THESE REASONS, CMA URGES THAT THIS SUBCOMMITTEE SERIOUSLY CONSIDER THE BAT MODIFICATION PROPOSAL.

I WILL BE PLEASED TO RESPOND TO ANY QUESTIONS YOU MAY HAVE.

CHEMICAL MANUFACTURERS ASSOCIATION

STATEMENT OF

ROBERT A. MATTHEWS

UNION CARBIDE CORPORATION

ON BEHALF OF THE

CHEMICAL MANUFACTURERS ASSOCIATION

BEFORE THE

SUBCOMMITTEE ON WATER RESOURCES

OF THE

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U. S. HOUSE OF REPRESENTATIVES

ON

POSSIBLE AMENDMENTS TO THE

CLEAN WATER ACT

NOVEMBER 3, 1983

EXECUTIVE SUMMARY

The Chemical Manufacturers Association (CMA) believes that the country has made considerable progress in water pollution control through implementation of the Clean Water Act in a reasonable and flexible manner. In order to continue this progress, CMA urges Congress to examine how the Act can be improved by directing attention to significant problems and ensuring that the Act addresses them in a sound manner. CMA has the following specific suggestions:

- Modification of BAT limitations. The treatment technology installed by industry to date has resulted in substantial improvements in our nation's waters. Consequently, implementation of BAT controls is not necessary in all cases. Modifications of BAT limitations should be allowed where an adequate environmental study shows that BAT is not necessary to achieve good water quality. Such modifications will avoid costly expenditures by industry for treatment technology that will not improve environmental quality. We believe that a workable modification scheme can be established consistent with the nation's commitment to the control of toxic pollutants.

- Pretreatment. The pretreatment program has centered on national technology-based pretreatment standards that do not properly take into account the need for such treatment. The result is costly, redundant treatment by both industry and POTWs. EPA has recognized the need for more

flexibility in the pretreatment program. CMA supports a legislative amendment to allow POTWs to establish and implement local pretreatment programs in lieu of the national categorical pretreatment standards.

- Deadlines for compliance. The Act currently requires compliance with BAT and BCT effluent limitations by July 1, 1984. CMA supports an extension of this deadline to July 1, 1988, in order to allow EPA to complete the task of issuing its effluent limitations guidelines and to afford sufficient time after guidelines are issued to write permits and design and construct treatment facilities to meet the new limitations.

- Water quality requirements. Section 6 of H.R. 3282 specifies detailed requirements relating to the designation of uses of water bodies and the establishment of water quality standards to achieve those uses. This section would add undue rigidity to the water quality standards program and would unnecessarily tie EPA's hands in administering a complex program which requires flexibility to respond to local conditions. CMA opposes this amendment.

- Post-BAT requirements. Section 7 of H.R. 3282 prescribes requirements for the implementation by EPA of additional post-BAT water quality-based controls. The proposal is premature, since BAT has not been implemented. This proposal would also fundamentally alter the way in which water quality standards have traditionally been developed and implemented by taking from the states the authority to set such standards. Instead of attempting to legislate additional controls now, the Congress should direct EPA to undertake a study of the quality of the nation's waters that would allow Congress to assess what additional controls on point source discharges, if any, are necessary.

My name is Robert Matthews. I am an environmental attorney with the Union Carbide Corporation. Today I am testifying on behalf of the Chemical Manufacturers Association (CMA) on possible amendments to the Clean Water Act. CMA is a nonprofit trade association whose company members represent more than 90 percent of the production capacity of basic industrial chemicals in this country. CMA members are directly and significantly affected by the requirements of the Clean Water Act (CWA or "the Act"), and we are thus vitally interested in possible amendments to the Act.

The installation of pollution control equipment by American industry, in many cases prior to the enactment of the Clean Water Act, has brought about major advances in cleaning up and protecting the nation's waters. I am speaking here not only of conventional pollutants such as suspended solids or pH, but also of the toxic or priority pollutants that have been a specific concern since the 1977 amendments to the Act. As described more fully below, a study completed last year on joint CMA/EPA analyses of samples from industry wastewater treatment systems convincingly demonstrates that widely used biological treatment systems, which EPA has identified as the "best practicable technology" (BPT) for the organic chemicals industry category, remove a high percentage of most organic priority pollutants.

We believe that much of the improvement in water quality that the country has witnessed results from the flexible and reasonable manner in which EPA and the states

have implemented the Clean Water Act through the NPDES permit program. CMA urges the House of Representatives to take the occasion of the reauthorization of the Clean Water Act and the consideration of possible amendments to evaluate carefully the progress that industry has made during the past decade in water pollution control.

Current policies under the Act should be examined to ensure that future requirements are imposed in a flexible manner to allow alternative treatment to be used where it will protect the environment. This will avoid devoting administrative and financial resources to expensive treatment systems that will not provide water quality improvements. These principles apply with particular force to the BAT and pretreatment provisions of the Act, which were the subject of testimony before the Water Resources Subcommittee in 1982.

I. MODIFICATION OF BAT LIMITATIONS

A central feature of the Act's control of the discharge of pollutants is the requirement that industrial dischargers to the nation's waters meet a series of increasingly stringent levels of effluent limitations. The 1972 amendments effected a shift from exclusive reliance on water quality controls to technology-based effluent limitations. EPA is in the process of promulgating "best available technology" (BAT) effluent limitations guidelines for major industry categories to implement this part of the statutory scheme. Because the installation of controls by industry has

resulted in substantial improvements in our nation's waters, the implementation of BAT limitations will not be necessary in all cases. Accordingly, we believe that the Act should allow a modification of BAT limitations in appropriate situations to avoid treatment for treatment's sake where no appreciable benefit to the quality of the nation's waters will result.[1]

A. The Progress Achieved to Date

The progress to date in reducing the amount of pollutants that industry discharges to our nation's waters has been substantial. According to EPA, industrial controls installed to meet BPT limits have resulted in significant reductions of four key pollutants: biochemical oxygen demand by 69 percent; suspended solids by 80 percent; oil and grease by 71 percent; and dissolved solids by 52 percent."[2] BPT has also resulted in the removal of toxic heavy metals. As EPA testified, comparisons of estimated 1972 and BPT-level loadings of heavy metals from 26 industries show reductions between 80 and 93 percent.[3] EPA also reported a number of specific water

---

[1] The Act should also be amended to allow modification for conventional pollutants where circumstances warrant. See page 8, n.1 below.

[2] See June 14, 1983 Testimony of William D. Ruckelshaus Before the Senate Subcommittee on Environmental Pollution, Committee on Environment and Public Works; see also "Possible Amendments to the Federal Water Pollution Control Act," Hearings Before the Subcomm. on Water Resources of the House Comm. on Public Works and Transp., 97th Cong., 2d Sess. 12 (1982) (hereinafter 1982 House Hearings).

[3] 1982 House Hearings at 12-14.

quality success stories, including improvements in the Neches and Penobscot Rivers where fish are once again found in large numbers.[1]

The chemical industry takes satisfaction in its record of performance. In the absence of effluent limitations guidelines, most of the first level of technology-based permits, seeking to establish best practicable technology (BPT) limits, were developed on a case-by-case basis using the permit writer's best professional judgment. The record using this process has been a good one.

The treatment already installed by the chemical industry has achieved better than expected results in controlling priority (toxic) pollutants.[2] For example, the CMA/EPA Five-Plant Study completed last year demonstrates that well-designed and well-operated biological treatment systems are highly effective in removing organic priority pollutants. Let me describe briefly the study and its results.

---

[1] Id. at 14-19. See also Water Pollution Control Federation, "A Decade of Progress: America's Quest for Clean Water" (May 1983) (describing additional success stories).

[2] "The latest information indicates that the 129 'priority pollutants' on which the clean water regulatory program is primarily focused are less evident in both amounts and concentrations than previously believed." "Implementation of the Clean Water Act," Subcommittee on Oversight and Review, House Committee on Public Works and Transportation, Comm. Print 96-71, 96th Cong., 2d Sess. at 29-30 (1980) (hereinafter the House Oversight Report). The Oversight Subcommittee found that "to a degree not anticipated, the conventional secondary treatment technologies employed by municipalities and many industries have succeeded in removing most of the priority pollutants in a highly efficient manner." (Id. at 30). The Report refers to data showing that technology installed to meet BPT limits may be far more effective in removing or degrading toxic pollutants than previously anticipated. (Id. at 35).

The chemical industry undertook the Five-Plant Study to develop a long-term data base on the removal of toxic organics by biological treatment systems, which are the systems used by over 80 percent of the chemical industry. The study included an extensive quality control/quality assurance program to determine the reliability of the laboratory analyses and to assure the proper interpretation of the data base.[1] EPA nominated the five participating plants based upon the expected occurrences of specific organic priority pollutants of interest to EPA.

Based on the study results, CMA drew the following major conclusion: data collected during the Five-Plant Study indicate that toxic organic pollutants in all groups (volatiles, base/neutral, and acid) are removed, with few exceptions, to the limit of detection.[2] Organic priority pollutants were removed by 87 percent on the average.[3] Thus, the

---

[1] All samples were analyzed using gas chromatography/mass spectrometry (GC/MS) or gas chromatograph (GC) procedures (44 Fed. Reg. 69464 (Dec. 3, 1979)) or variations acceptable to EPA's Effluent Guidelines Division.

[2] Our analysis demonstrates that analytical method precision and accuracy as measured by intralaboratory repeatability, interlaboratory reproducibility and recovery of known spikes remain as the dominant limiting factor controlling the use of toxic organic pollutant data. For example, for a single laboratory, if a volatile organic pollutant were measured in a single sample as 100 parts per billion (ppb), a second analysis of that same sample could yield a result as low as 20 ppb or as high as 500 ppb.

[3] A summary of the results of the CMA/EPA Five-Plant Study is contained in Appendix I below.

wastewater treatment systems installed to meet 1977 BPT requirements have substantially reduced the discharges of organic priority pollutants of concern in the chemical industry.

These data are confirmed by other studies.[1] Attached to my statement are data from several Union Carbide plants which employ biological treatment and which have achieved priority pollutant removal efficiencies of 99 percent and above.[2] A company-wide study by Du Pont, completed in 1978, also showed high efficiencies of control of priority pollutants.[3] Data from a Business Roundtable study show similar high removals of priority pollutants ranging from 60 to 95 percent by biological treatment, the treatment employed by most of the chemical industry.[4] Based on a survey of 61 CMA member plants, CMA has concluded that the concentration of the sum of all priority pollutants in the effluent from chemical industry plants is less than 1 part per million.

---

[1] A study on the treatability of specific organic compounds in chemical industry wastewaters showed removals higher than 65 percent for most pollutants, with many pollutants being removed in the 80 to 90 percent range. Kincannon, D.F., Stover, E.L., "Biological Treatability of Specific Organic Compounds Found in Chemical Industry Wastewaters," 36th Purdue IWC, West Lafayette, Ind. (May 1981).

[2] See Appendix II below.

[3] See Appendix III below.

[4] Environmental Research & Technology, Inc., "Analysis of Technical Issues Related to Reauthorization of the Clean Water Act," Chapter 5 (July 1982) (hereinafter the Business Roundtable study).

These high percentage removals have been achieved at significant expense. By 1976, the chemical industry had spent $1.8 billion for pollution control equipment, which cost almost $400 million a year to operate. At the end of 1981, America's chemical companies had more than doubled their capital investment in water pollution control to $3.7 billion, and in 1981 it cost $1 billion to operate those facilities. In total, the chemical industry expended nearly $10 billion for the construction, operation and maintenance of water pollution control facilities through 1981.[1] Additional significant expenditures nationwide are not warranted.

B. The Need for Flexibility

EPA has now begun the implementation of the second level of technology controls, namely BAT.[2] CMA believes that the success achieved to date in improving water quality can best be maintained and enhanced if additional flexibility is allowed in the Act. Considering the substantial anticipated costs of across-the-board BAT controls, and the unanticipated significant reductions in discharges of priority pollutants to date, BAT controls will not be warranted in some cases. In order to avoid the imposition of costly treatment requirements

---

[1] Bureau of Census, U.S. Department of Commerce, Annual Reports of Pollution Abatement Costs.

[2] EPA's proposed BAT effluent limitations for the organic chemicals industry are in large part based on data from the Five-Plant Study discussed above.

that are not necessary to achieve good water quality, we request that Congress amend the Clean Water Act to allow additional flexibility in the use of BAT effluent limitations. Where water quality circumstances permit, a discharger should be allowed to qualify for alternative BAT effluent limitations.[1] In particular, the Act should be amended to allow for a modification of BAT effluent limitations where the applicant can show that the resulting discharge of pollutants will not pose an unacceptable risk of harm in the receiving water based on the water's designated use.

According to the Business Roundtable study submitted last year to the House Subcommittee on Water Resources, a mandated change from BPT to BAT treatment on a national basis will result in only a 2-3 percent additional reduction in the quantities of priority pollutants discharged to our nation's waters.[2] The reason for this is twofold. First, as noted above, treatment controls installed to meet BPT effluent limits have removed a high percentage of priority pollutants. Second, discharges from industrial point sources constitute a relatively small (3-10) percentage of priority pollutant

---

[1] Section 301(g) of the Act provides for a modification of the BAT limitations applicable to nonconventional pollutants where such modification will not interfere with the attainment or maintenance of water quality. Section 301(g) does not apply to toxic or conventional pollutants. Moreover, Section 301(l) of the Act expressly precludes such a waiver for toxic pollutants

[2] 1982 House Hearings at 1045.

discharges to surface waters.[1] What this means, as the Business Roundtable concluded, is that greater attention should be given to identifying and controlling other sources of priority pollutant discharges, particularly nonpoint sources, and to addressing site-specific problems.[2]

Let me illustrate the reason why we continue to urge the Congress to allow alternative limitations to BAT. One of Union Carbide's plants discharges an average of one-half pound per day of phenol. In order to achieve EPA's proposed BAT limits on a consistent, enforceable basis, the plant believes that it will have to achieve close to zero discharge of phenol at a capital cost of over $2 million. Is this $2 million expense to remove one-half pound needed to protect water quality? Unfortunately, the Clean Water Act does not allow the issue to be raised; CMA believes that it should.

Another CMA member provides a second example. The Du Pont plant in Beaumont, Texas manufactures six chemical

---

[1] Id. at 1044-45.

[2] See also, id. at 1011-13 (testimony of the American Petroleum Institute). The Association of State and Interstate Water Pollution Control Administrators has also urged the Water Resources Subcommittee to focus on the appropriate level of toxic removal rather than a given level of technology after BPT limits have been met. In testimony on July 28, 1982, the Association recommended that BPT requirements be maintained as the minimum national treatment requirements for industrial dischargers, with additional controls as needed to control toxic pollutants in toxic amounts and avoid "treatment for treatment's sake." Id. at 1390-91.

products and employs 1400 people. The plant utilizes biological treatment along with a variety of wastewater treatment technologies (with a replacement cost of $27 million and a 1982 operating cost of $14 million) to meet its current BPT limitations.

Earlier this year, Du Pont completed a study to measure the impact of this plant on the receiving water, the Neches River, and estimated the costs of compliance with future BAT requirements. Samples of river water above and below Du Pont's Beaumont plant and at the plant's outfall were analyzed for 125 priority pollutants. The results of this study were as follows:

-- Only seven organic priority pollutants were detected in the river, and in each instance the level was too low to quantify.

-- Six heavy metals were detected in the river. In every case, the ranges of concentrations below the Du Pont outfall were essentially the same as those found above the outfall.

The study results show that Du Pont's discharge is a negligible source of priority pollutants in the Neches River.[1]

In contrast, the costs of meeting anticipated BAT requirements would be large. Du Pont estimates that it would

---

[1] A summary of the results of the study is contained in Appendix IV below.

have to spend at least $5 million in new capital and $2 million in annual operating costs to meet BAT requirements at this plant, based on activated carbon treatment of isolated streams. The foregoing study provides evidence that such expenditures are not warranted since further treatment of Du Pont's discharge would not appear to result in any perceptible improvement in water quality.[1]

We think it would be a wise policy to allow industry the opportunity to persuade the permit authority that alternate limitations are warranted for such plants. Under the current statute, we cannot do so.

The BAT modification scheme that CMA proposes would operate in a straightforward manner:

1. Application for a modification would be made by the discharger, who would have the burden of proof.

2. The application would be acted on by the NPDES permit-issuing agency -- by the state where there is delegation or (in the absence of delegation) by EPA.

3. The modification would be on a pollutant-by-pollutant basis from BAT effluent limits.

4. The discharger would have to show either that water quality standards are being met (or could be met with the application of additional controls short of BAT) or (where there are no standards for

---

[1] We recognize, of course, that the Beaumont study was not exhaustive and that additional data might have to be assembled to support a modification request, as described below.

the pollutant involved) that its present or proposed discharge levels will not pose an unacceptable risk of harm in the receiving water based on the designated use of such water.

5. The permit writer would exercise judgment in evaluating the necessary data and the merits of modification requests in each particular case.

6. The permit writer may require additional monitoring (including biological testing) as a condition of granting the modification, as circumstances warrant.

7. A BAT modification would not relieve the discharger from meeting any applicable BPT or water quality requirements.

The discharger would be able to make a case for a BAT modification in one of several ways. First of all, if a water quality standard exists for a pollutant that would otherwise be regulated by BAT, then the discharger could seek to establish that the standard is being met -- or could be met with the application of additional controls short of BAT. For example, if total maximum daily loads (TMDLs) have been established for the facility in question, then the applicant could show that the quantity of its discharge of a pollutant is less than the TMDL value. Alternatively, if no TMDL has been established, the discharger could show, by analysis of samples from the water body in question, that the standard for the pollutant is being met.

In situations where a water quality standard has not yet been established for a pollutant of concern, a BAT modification would be appropriate where the applicant can show that

its discharge will not pose an unacceptable risk of harm in the receiving water based on the designated use of such water. This showing could be made on the basis of biological monitoring, or by alternate means.[1] Safe levels could be established in several ways -- for example, by biological studies, by using the acute level and a validated or agreed-upon application factor, or by reference to the scientific literature.

It is neither necessary nor appropriate that the precise scientific requirements for a BAT modification be established in the statute. The permitting agencies should have flexibility to determine what data will be sufficient to establish the absence of an unacceptable risk of harm to the environment on a case-by-case basis. Knowledge of the discharge in question, the pollutants of concern, the nature of the receiving water body, potential affected aquatic organisms, and other relevant site-specific factors will enable the permitting authority to make sound judgments on the merits of a modification request. Similarly, the permitting authority is in the best position to determine the need for any other requirements, such as additional conventional or biological testing, that may be appropriate as a condition of granting the BAT modification.

The proposed BAT modification will provide needed flexibility. It would allow plants that can demonstrate the

---

[1] See House Oversight Report at 62.

control of toxics to a level that protects water quality to meet alternate limits instead of the national BAT requirements. We expect that only a limited number of plants will seek a BAT modification. An adequate scientific showing will be required to obtain such a modification. The modification process can and should be administered in a manner that avoids protracted proceedings, paperwork and expense for all concerned, while assuring that the environment is protected. Of course, it should be emphasized that a BAT modification will not relieve the discharger from meeting applicable BPT or water quality requirements.

II. LOCAL CONTROL OF THE PRETREATMENT PROGRAM

The current program for regulating industrial discharges to publicly owned treatment works (POTWs) consists of national technology-based pretreatment standards. As shown below, the application of uniform EPA categorical pretreatment standards will not appreciably reduce water quality violations where they exist. Moreover, for those POTWs thought to cause a water quality problem, the mixture of industrial and other discharges to POTWs varies so widely that any water quality problems that exist can better be controlled at the state and local level. Accordingly, we urge that the Act be amended to allow POTWs the opportunity to implement local programs in lieu of the federal categorical standards.[1]

---

[1] We also discuss the application of Section 301(k) of the Act to pretreatment, below at p. 27.

The need for local control of pretreatment requirements has received broad based support in testimony before Congress. The Association of Metropolitan Sewerage Agencies (AMSA), whose members serve 70 million people, testified before the House Subcommittee on Water Resources that POTWs should have the primary role in framing and implementing the necessary pretreatment controls. AMSA urged Congress to allow POTWs meeting certain standards to opt out of the federal program, which would require implementation of national categorical standards.[1] The Association of State and Interstate Water Pollution Control Administrators also urged that POTWs with programs "equivalent" to the federal program be allowed to administer those local programs as alternatives to the federal program.[2] The Water Pollution Control Federation supported this approach as well.[3] In addition, a number of industry groups testified that national categorical pretreatment standards should be abandoned in favor of local controls.[4]

A. The Need for Reform

Section 307(b) of the Act authorizes EPA to establish national pretreatment standards for pollutants that

---

[1] 1982 House Hearings at 329-40.

[2] Id. at 1386-88.

[3] Id. at 1415, 1421-28.

[4] Id. at 976-82 (CMA), 1048-49 (Business Roundtable), 1052-96 (National Association of Metal Finishers), 1018-20 (American Petroleum Institute).

interfere with the operation of POTWs or pass through untreated. EPA has developed an elaborate and cumbersome pretreatment program to implement this provision. The most onerous aspect of this program involves the promulgation of national technology-based pretreatment standards applicable to industrial dischargers of toxic and nonconventional pollutants. Typically, these "categorical" pretreatment standards have been identical to BAT effluent limitations guidelines applicable to direct dischargers. In the development of these standards, EPA has given inadequate consideration to the amount of interference with the operation of POTWs and the extent to which municipal treatment systems effectively remove pollutants.[1] Meeting such standards will therefore inevitably require expenditures by industry for treatment that substantially duplicates treatment by POTWs.

One example of this potential for redundant treatment is found in EPA's proposed pretreatment standards for the organic chemicals industry.[2] While EPA has not specified the treatment technology necessary to meet the standards, the data

---

[1] Current EPA policy requires imposition of BAT-level pretreatment standards whenever BAT treatment would remove more than typical POTWs even where POTW removals are at very high levels. (See 48 Fed. Reg. 11841 (Mar. 21, 1983)). In theory EPA's regulations allow for "credits" reflecting removal of pollutants by POTWs (40 C.F.R. § 403.7), but the removal credit program has been widely criticized by municipalities and industry as being unworkable. See the 1980 House Oversight Report at 40-44 and 59-60.

[2] 48 Fed. Reg. 11828 (Mar. 21, 1983).

on which EPA relies to support the proposed standards are based entirely upon treatment achievable by biological systems -- the identical treatment employed by POTWs. To meet the pretreatment standards, industrial dischargers may be required to duplicate the very treatment provided by POTWs.

To alleviate this problem of redundant treatment, Congress in 1977 provided for modifications of national categorical pretreatment standards to reflect pollutant removals achieved by POTWs. EPA has attempted to implement this provision in regulations that allow POTWs to apply for so-called "removal credits," but the POTWs consider these regulations to be so complex and restrictive that they will not apply for the credits.[1] Without credits, industrial dischargers will be required to install expensive treatment technology to meet pretreatment limits even though the POTW may remove all or most of certain pollutants in the dischargers' effluents.[2]

We believe that the pretreatment program can be strengthened by directing attention to the particular problems

---

[1] The House Oversight Report (at 42) quotes one municipal witness at the Subcommittee's hearings in June 1980 as stating, "The restrictions and difficulties involved in the granting of removal credits lead to the conclusion that the EPA was never serious about allowing removal credits to industry."

[2] Data from municipal treatment plant monitoring show that POTW secondary treatment is extremely effective at removing toxic organics. "Fate of Priority Pollutants in Publicly Owned Treatment Works," (EPA-440/1-82/303) (Sept. 1982). This is consistent with the Five-Plant Study results discussed above at pp. 4-5.

of interference and pass through identified in Section 307(b) of the Act, and by placing principal responsibility for pretreatment requirements on the municipalities and states involved. A lengthy report prepared in 1981 by EPA's contractor, JRB Associates, concludes that such a targeted approach would be most effective.[1] The report contains these principal findings:

1. Much progress has already occurred without national categorical standards. Many POTWs have successfully implemented local programs for years. These programs have significantly improved the quality of the nation's waters.[2]

2. The problems that exist with respect to water quality or sludge disposal are site-specific and cannot readily be solved by uniform, national standards. As the JRB report notes: "Upsets, bypasses, interference and sludge contamination are site-specific problems with site-specific solutions" (at 4-1).[3]

---

[1] JRB Associates, Inc., "Assessment of the Impacts of Industrial Discharges on Publicly Owned Treatment Works" (Nov. 20, 1981).

[2] Table 1-1 of the JRB report illustrates this point. The volume of toxic metals discharged to POTWs has been reduced from 160 million to 56 million pounds per year, a two-thirds reduction, even though industry has not yet had to comply with national categorical standards. This information is based upon EPA Effluent Guidelines Division data that are several years old. Actual progress to date is probably even greater than indicated in the JRB report.

[3] The problems and solutions are site-specific in terms of the pollutant(s) of concern, the source(s) of the pollutant(s),

(footnote cont'd)

3. The application of national categorical standards will not appreciably reduce the number of water quality violations, where they exist. According to the JRB report, 54 percent of the POTWs discharge at levels meeting EPA's stringent water quality criteria in receiving waters, 27 percent exceed the criteria for one pollutant, and 19 percent exceed the criteria for two pollutants.[1] These water quality concerns should be addressed, but uniform application of national categorical standards is not an effective approach. The reported data indicate that only 61 POTWs (or 7 percent of the total not meeting the criteria) would comply with the criteria

---

(footnote cont'd)

the nature of the concern (e.g., water quality, sludge use), and options for addressing the problem. In one case, for example, there might be a sludge use problem caused by cadmium; in another, there might be a water quality problem due to a toxic organic. The problem might be caused by a particular plant or industry, or it might be due to domestic users or storm water runoff. Even if a problem is caused by industrial users, they may or may not be within the 22 specific industry categories that would be subject to national categorical standards -- even if the full pretreatment program were developed by EPA. In most cases, the application of the national standards will miss the mark, being either too stringent or not sufficiently inclusive to do the job. See JRB report at 4-1.

[1] Id. at Ch. 3. The JRB report was based on EPA's published water quality criteria under Section 304(a) of the Act. These criteria are not water quality standards under Section 303 of the Act. Moreover, EPA's criteria have been widely criticized as unnecessarily stringent and based upon faulty methodology and data.

after implementation of categorical standards.[1] (See Table 4-3 of the JRB report.)

4. A targeted, local approach is clearly the most cost-effective option, rather than categorical standards.

> Targeted options require control actions only where there are water quality problems, whereas options that are untargeted require control actions regardless of local environmental conditions. (JRB report at 4-4). Regulation of the POTW provides the opportunity for the POTW to meet its effluent limitations (whether water quality based or technology based) in the most cost-effective manner. (Id. at 4-5).

These findings are consistent with the recommendations of the House Oversight Report, which unequivocally recommends that the use of national categorical pretreatment standards be abandoned.[2]

B. Alternative Local Programs

Congress should allow the implementation of local pretreatment programs in lieu of EPA categorical standards where the municipalities have the capability to develop and enforce such programs. This approach is consistent with

---

[1] Categorical standards would address only a portion of the pollutants entering POTWs. POTWs also receive pollutants from domestic users, storm water runoff, as well as industrial users not subject to the categorical standards. It is thus unrealistic to think that implementation of national categorical standards will fully address any problems that exist.

[2] The House Oversight Report (at 62) states that steps should be taken immediately to allow municipal treatment authorities to implement their own pretreatment programs, which would include the establishment of local pretreatment standards.

recommendations of the Association of Metropolitan Sewerage Agencies and other interested organizations that testified before this subcommittee last year and endorsed the local program concept as a mechanism to add needed flexibility in pretreatment control.

The essential ingredient of this proposal is a local pretreatment program that would operate in lieu of EPA categorical standards where a POTW meets certain requirements. The POTW would have to develop and implement a local pretreatment program to control industrial dischargers as necessary to avoid interference with its operations and pass through of pollutants. Each POTW would bear the responsibility to address any particular problems confronting its treatment system. In addition, the POTW would have to be either achieving secondary treatment or be on a schedule of compliance. The POTW would of course have to show that it has adequate funding and other resources to implement its local program.

POTWs currently are required to obtain an NPDES permit from EPA or an approved state. That permit should assure that the POTW meets secondary treatment as well as water quality standards. In addition, a POTW must assure that its sludge meets applicable requirements. The POTW is in the best position to determine what pretreatment standards are necessary in order to solve local compliance problems and protect the integrity of the treatment system. Each POTW has a unique situation based on the nature of its treatment

system, the influent to that system, and the receiving stream to which it discharges. Rigid national categorical pretreatment standards leave no flexibility to address those unique problems.

Local pretreatment controls will direct resources to particular problems rather than to treatment for treatment's sake. For example, assume that a particular POTW is experiencing a serious cadmium problem (due to sludge use or water quality concerns) as a result of industrial discharges, but no other pollutants are of concern. In such a case, it would make more sense to allocate resources to cadmium reduction and control than to control a list of pollutants in categorical standards which would not solve the cadmium problem. Through a targeted effort on cadmium, it is quite likely that industry could achieve far greater reductions of cadmium at far lower costs than required by the national standards.

Congress has spent billions of dollars for central municipal treatment systems through the construction grants program. Industry should not be required to devote additional large amounts of resources for unnecessary and redundant treatment. Instead, industry pretreatment requirements should be established on a local basis by the entity which is in the best position to identify needed controls, namely the local municipal sewage treatment agency. We recognize that some POTWs may not have the inclination or resources to develop a

local program, and in those cases the EPA categorical standards would remain as a backup. However, we submit that where a POTW has the authority and resources, a locally-developed pretreatment program is the most effective means for accomplishing the objectives of the Act.

C. Implementation of Categorical Standards

Since under our proposal federal categorical standards would still be used in the absence of local programs, CMA wishes to note two additional problems with the national categorical standards that deserve the attention of Congress: removal credits and the combined wastestream formula. As discussed above, municipal authorities have uniformly criticized EPA's removal credit regulations as needlessly complex and unworkable.[1] EPA has taken a step in the right direction with its proposed national removal credit regulations, which provide for "automatic" approval of credits for eligible POTWs discharging certain metals covered in the regulations.[2] The Agency should be directed to simplify the removal credit regulations, including the procedures for POTWs to demonstrate removal levels, and to make national credits available for a greater number of pollutants that will be covered by categorical standards.

---

[1] House Oversight Report, supra, at 42. See p. 17 above.

[2] 47 Fed. Reg. 42698 (Sept. 28, 1982).

The combined wastestream formula in 40 C.F.R. § 403.6(e) of EPA's regulations calculates effluent limitations applicable to plants with different processes subject to more than one categorical pretreatment standard. As a result of the formula and EPA's sequential, piecemeal approach to developing categorical standards, the pretreatment requirements applicable to complex manufacturing plants (so-called integrated facilities) change as EPA promulgates categorical standards.[1] These integrated facilities thus are subject to constantly changing discharge limitations. This makes it virtually impossible to properly design a treatment system. The Act should be amended to allow an integrated facility to comply up to three years after the promulgation of the last categorical standard applicable to the facility.[2]

III. EXTENSION FOR COMPLIANCE WITH BAT AND BCT EFFLUENT LIMITATIONS

Section 301(b) of the Act requires compliance by July 1, 1984, with BAT and BCT effluent limitations for toxic and conventional pollutants, respectively. When this deadline was established, Congress hoped that EPA could issue effluent limitations guidelines promptly, implement these guidelines in NPDES permits, and still allow sufficient time (3 to 3-1/2 years) to install treatment systems to achieve compliance.

---

[1] See Cong. Rec. S.1011 (daily ed. Feb. 3, 1983) (remarks of Senator Randolph in introducing S.432).

[2] See also pages 26-27 below.

This date has become unreasonable in light of the fact that EPA has not been able to promulgate effluent limitations guidelines for many industry categories.[1] In particular, we understand that EPA will not be able to promulgate guidelines for the organic chemicals, plastics and synthetic fibers industry by the 1984 deadline.

Congress should extend the date for compliance with BAT and BCT limitations in order to allow EPA to complete its task of issuing regulations, and to provide sufficient time for industry to comply with NPDES permit requirements based on published effluent limitations guidelines as well as case-by-case permit requirements in the absence of guidelines. We support an extension of the deadline for compliance with BAT and BCT limitations to July 1, 1988.

Section 4 of H.R. 3282 recognizes the above problems with the 1984 deadline and would extend it to 1987 for BCT and to three years after limitations are established for BAT.

---

[1] See p. 30 below. The House Oversight Report notes (at 29) that then current problems besetting the Agency "call into grave question whether the EPA is truly capable of putting into effect a genuinely workable, legally defensible and cost-effective regulatory scheme with which industry and local government can reasonably be expected to comply within the statutory deadlines." Since then, the delays in promulgating effluent limitations guidelines have continued. The House Oversight Report (at 62) recommends that this reality "be recognized sooner rather than later," and that the 1984 date for compliance be extended to compensate for EPA's delay in issuing effluent limitations guidelines.

While we agree with the general philosophy behind this extension, we believe that a July 1, 1988 deadline is warranted for BCT and BAT limitations. This should allow EPA to complete its promulgation of guidelines, which have repeatedly been delayed, and should allow EPA and the states some time to translate those guidelines into NPDES permits for particular facilities. Such an extension is likely to avoid the need for Congress to reexamine this deadline again.

In this regard, we should point out that a large manufacturing plant faces a moving BAT target as EPA promulgates guidelines for various categories that apply to that plant. As new guidelines are promulgated, the effluent limits that a plant subject to multiple guidelines must meet change. A July 1, 1988 deadline for BAT would alleviate this problem because presumably all applicable guidelines would have been promulgated well in advance of that date, leaving dischargers sufficient time to install the technology necessary to meet the final effluent limitations that reflect all of the applicable guidelines.[1] Thus, to enable permittees to construct treatment systems to meet BAT and BCT limits, and to avoid a

---

[1] Our proposal assumes that the organic chemicals and other affected industries would have at least three years from the promulgation of effluent limitations guidelines to meet BAT requirements. Should EPA fall even farther behind in promulgating the guidelines, an extension beyond July 1, 1988 would be warranted.

moving target problem, there should be a common deadline for compliance with these sets of limitations.

We also note that H.R. 3282 fails to address Section 301(k) of the Act, which provides for an extension of time for BAT and BCT to allow for the use of innovative technology. The present deadline in Section 301(k) is July 1, 1987, which is three years after the current deadline for BAT and BCT. If this provision is to continue to have vitality, its deadline should be extended to three years beyond the new deadline established by Congress for BAT and BCT. Moreover, Section 301(k) now applies only to direct dischargers; that is, only plants that discharge directly into waters of the United States can qualify for an extension of the compliance time to allow for the use of innovative technology. Since pretreatment standards are based upon the use of appropriate technology, Congress should amend Section 301(k) to make it apply as well to indirect dischargers to publicly owned treatment works, allowing those qualifying dischargers who use innovative technology an additional three years to comply with applicable categorical pretreatment standards.

IV. WATER QUALITY STANDARDS

Section 6 of H.R. 3282 would codify detailed requirements governing the conditions under which a state may modify designated uses for water bodies and the establishment of water quality standards. This proposal runs counter to the basic

20-955 O—84——122

philosophy in the Clean Water Act to give the states the primary responsibility for designating water uses and establishing water quality standards appropriate for those uses. The proposal would also interject undue rigidity into the water quality standards setting process. Finally, the proposed amendment is unnecessary, since EPA has indicated that it does not intend to promulgate the water quality standards regulations which apparently caused concern in Congress and gave rise to this Congressional proposal.

Congress has recognized that water quality standards must be flexible to respond to different needs.[1] Accordingly, authority to establish such standards has been vested in the states which are best able to judge the appropriate uses of their waters. Section 303 of the Act requires states to establish water quality standards consisting of designated uses of water bodies and water quality criteria based upon such uses. The Act does not authorize the imposition of a national standard. Section 303(a) of the Act incorporates prior law, which expressly envisioned the classification of waters for multiple uses. Sections 101(b) and (g) of the Act also reflect the policy of Congress to preserve the primary responsibilities of the states to prevent and reduce pollution, and to plan the development and use of land and water resources.

---

[1] See Appendix V below.

Proposed Section 6 would curb the authority of the states by dictating which pollutants must be considered and limited in establishing state water quality standards and by curbing the authority of states to designate water uses. Section 6 is based on EPA's existing water quality regulations, which more than adequately address these issues.[1]

The impetus for Section 6 was EPA's proposal in October, 1982 to modify those regulations in a way that some members of Congress apparently found troubling. EPA has reportedly now indicated that it will not promulgate the controversial provisions of the October, 1982 proposal. We therefore see no need for legislation to amend the water quality provisions of the Act. Doing so would add more rigidity to a program where flexibility is needed, and would remove from EPA and the states authority that is best left in their hands.

V. POST-BAT REQUIREMENTS

Section 7 requires the Administrator to identify waters within each state that, in the Administrator's opinion, are not expected to meet water quality due to discharges of toxic pollutants from point sources. Within one year after publishing the list of such waters, the Administrator is required to propose regulations setting forth an individual

---

[1] See 40 C.F.R. § 35.1550.

control strategy for each noncomplying water body. After promulgation, each strategy must be implemented by modifying discharge permits issued to direct dischargers under Section 402 of the Act. This provision is neither necessary nor appropriate at this time; it ignores entirely problems caused by non-point source discharges which may far exceed problems created by direct discharges, and it would usurp the role of the states in setting water quality standards and issuing NPDES permits. CMA urges that Congress direct EPA to conduct a thorough study of the current quality of the nation's waters. The results of this study will allow all concerned to make better judgments as to the need to improve current programs.

A. Post-BAT Requirements Are Premature and Inappropriate.

Proposed Section 7 is premature. EPA is only now promulgating BAT effluent limitations guidelines for major segments of American industry. According to EPA's latest schedule for guidelines promulgation that was submitted to the court in connection with the NRDC Consent Decree litigation, EPA does not expect final promulgation of all BAT effluent limitations guidelines before November, 1984. It will then generally take at least three years for permit limits to be established and for the technology necessary to meet the guidelines to be designed, installed and operational. Any

designation of waters that fail to meet water quality standards should be deferred until BAT technology has been installed. Only then will it be possible to ascertain what additional controls on point sources beyond BAT, if any, are necessary to meet water quality standards.

In addition, Section 7 fails adequately to address problems caused by non-point source discharges. As noted earlier, significant progress has been made to date in cleaning up our nation's waters as a result of controls on point source industrial dischargers. When viewed as a whole, industrial discharges no longer pose major environmental problems. As a result, more stringent controls on direct point source discharges will not result in appreciable gains in water quality. In contrast, significant sources of non-point source pollution, such as runoff from farms and urban areas, have not yet been effectively controlled.[1] EPA has itself noted that "control of non-point source pollution has not progressed as fast as control of point sources" and that levels of conventional pollutants in surface waters has not noticeably improved in recent years "because non-point sources

---

[1] See "National Water Quality Goals Cannot Be Attained Without More Attention To Pollution From Diffuse Or 'Nonpoint' Sources," Comptroller General of the United States (Dec. 20, 1977).

are responsible for much of these pollutants."[1] This conclusion was confirmed recently by the Business Roundtable study. Data in that study indicate that urban runoff and other non-point sources can be significant contributors of priority pollutants, especially metals, to our nation's waters.[2] Further progress in improving water quality can be made in a comprehensive and effective manner only if prompt attention is given to non-point source pollution and its control.

Finally, Section 7 would fundamentally alter the way in which water quality standards are established under the Act. As noted earlier, the development of water quality standards has always been the primary responsbility of the states, subject to oversight by EPA.[3] There is a good reason for this allocation of responsibility since states are in a better position than the federal government to know what limitations are necessary to achieve designated water quality, based upon local needs and conditions. Section 7 would transfer this authority away from local authorities to the federal EPA. Removing the decision-making authority from the entities better equipped to exercise that authority would be

---

[1] See Environmental Outlook 1980, United States Environmental Protection Agency, Office of Research and Development, No. 600/8-80-003 at 409.

[2] Business Roundtable study at 5-33 to 5-45.

[3] See Appendix V below.

ill-advised. This is especially true in light of the fact that there are no compelling reasons for making such a radical change. Primary responsibility for setting water quality standards should remain with the states.

B. The Need for Data on the Quality of the Nation's Waters

Instead of enacting legislation to address post-BAT concerns before BAT has even been implemented nationally, Congress should direct EPA to gather necessary data on the quality of our nation's waters to determine what problems, if any, remain and the source of those problems. The inadequacy of the data necessary to assess the quality of our nation's waters is a long-standing problem. The 1976 report of the National Commission on Water Quality contains the following recommendations as to water quality research:

> The Congress should encourage accelerated research on the identification and measurement of toxic pollutants and their effects, sources of toxic pollutants in the environment and the nation's waters, the fate of toxic pollutants in the aquatic environment and their impacts upon organisms and upon human health, and the identification of sound control technologies for the elimination of toxic pollutants.
>
> * * *
>
> This is an area in which the level of understanding is severely limited. It must be increased and refined if the nation is to adequately assure the protection of the health and safety of its citizens and their natural environment.[1]

---

[1] Final Report of the National Commission on Water Quality, H. Doc. No. 94-418, 94th Cong., 2d Sess. 10, 31-32 (1976).

Yet, despite this recognition in 1976 of the lack of required data, the problem of inadequate data still exists. In a major EPA report entitled Environmental Outlook 1980,[1] the Agency stated that a "major limitation" on the Agency's ability to assess trends in water quality associated with point source discharges is "the incomplete coverage of toxic substances . . . [stemming] from a lack of data to base projections on." In response to a question last year from the House Subcommittee on Water Resources, EPA stated that "EPA does not believe that current monitoring programs are focused on the right kinds of data collection to support Clean Water Act requirements for . . . planning, or evaluation of trends."[2] The time has come to address this fundamental problem head on.

Certain provisions of the Act already require EPA to undertake studies to assess the quality of the nation's waters. Section 104(a) of the Act requires EPA to conduct investigations concerning the pollution of any navigable waters and establish a water quality surveillance system. Section 305 requires states to prepare reports biennially describing the water quality of all navigable waters and EPA to submit such reports, together with an analysis of them, to Congress.

---

[1] United States Environmental Protection Agency, Office of Research and Development, No. 600/8-80-003 at 243.

[2] 1982 House Hearings at 104. A 1982 study for CMA by Environmental Resources Management came to the same conclusion. See Appendix VI below.

These provisions have not, however, produced the required data. Congress should strengthen these provisions by describing more fully what data are to be included in the reports and by providing adequate funding for the studies. Alternatively, Congress should adopt a wholly new provision requiring EPA to undertake a comprehensive analysis of the quality of our waters, taking into account attainable uses of those waters as designated by the states.[1] In particular, EPA should be required to obtain reliable and analytically sound data on the amount of pollutants still present in our waters, the effect of such pollutants, and their sources. Only when such data have been compiled and analyzed can Congress intelligently decide what point source controls beyond BAT, if any, are necessary.

CONCLUSION

This testimony discusses key areas in which Congress should reassess and modify current provisions of the Clean Water Act to make it a more workable vehicle for protecting the environment in a reasonable manner. CMA is prepared to cooperate with the Congress to address these issues in a constructive manner.

---

[1] We urge that EPA undertake the study promptly, recognizing that the initial data will reflect pre-BAT water quality. CMA envisions that the study will be ongoing, so that post-BAT data can be compared with the initial study results.

APPENDIX I

CMA/EPA FIVE PLANT STUDY

An analysis was conducted by Engineering-Science, Inc. (ES) for the Chemical Manufacturers Association (CMA) on the data base developed by a cooperative study among CMA, the U.S. Environmental Protection Agency (EPA), and five organic chemical plants that participated in this project. The study was a substitute for the 530 plant, 30 day, self-monitoring program that EPA proposed in a Federal Register notice of October 10, 1979.

The study was structured to develop a long-term (4 to 6 days/week for 4 to 6 weeks) data base on the removal of priority organics by representative, well-designed and operated biological treatment plants within the organic chemicals industry. EPA through contract laboratories analyzed all of the samples. A CMA contractor analyzed about 25 percent and four of the participating plants analyzed from 25 to 100 percent of the samples. Each plant also analyzed influent and effluent samples for selected conventional and nonconventional pollutants.

An extensive quality control/quality assurance program was incorporated into this effort to assure that the reliability of the analytical results could be properly defined.

Based upon the study results, the following major conclusions were drawn from the CMA report:

- Data collected indicate that priority organic pollutants in all groups (volatiles, base/neutral, and acid) are removed, with few exceptions, to or below the 10 parts per billion detection limit accepted in this study. Thus, one can conclude that the five biological wastewater treatment facilities installed to meet BPT provide sufficient removal of most priority organic pollutants to be designated as BAT technology consistent with the Clean Water Act of 1977.

- Analytical method precision and accuracy as measured by intralaboratory repeatability, interlaboratory reproducibility and recovery of known spikes remain as the dominant limiting factor controlling the use of priority organic pollutant data. For example, for a single laboratory, if a volatile organic pollutant were measured in a single sample as 100 ppb, a second analysis of that same sample could yield a result as low as 20 ppb or as high as 500 ppb.

- Analysis of the study results provides strong confirmation that conventional and nonconventional pollutants cannot be used as indicators of the presence of priority organic pollutants in biologically treated effluents from the organic chemicals industry.

1,2,3,4 - Reported as isomer pairs

ND - not detected

** - There was some question in the proper identification of these compounds in some of the samples, based on the following information:

(1) 1,2,4-trichlorobenzene - most likely the co-isomer, 2,4,6-trichlorobenzene, which is not on the priority pollutant list.
(2) Diethylphthalate - interference with dimethyl nitroaniline which coelutes with the phthalate ester.
(3) Acenaphthylene - interference with dichloroaniline or biphenyl which coelutes with acenaphtylene.
(4) Butylbenzylphthalate - most likely a product from a manufacturing process and not the phthalate ester.

APPENDIX III

ANALYSIS OF DU PONT PLANT SITE WASTEWATERS FOR PRIORITY POLLUTANTS

In 1978 the Du Pont Company embarked on a Company-wide sampling and analytical program for 128 of the 129 "priority pollutants" in plant intake, outfall, raw waste, and treated effluent streams at 72 manufacturing sites. This program was completed at substantial cost in 1979. The analytical work was performed by the Acurex Corporation of Mountain View, California, using EPA methods. Generally each plant had a single sampling campaign; our large number of plants provides a sizable data base.

Over 36,000 analytical results (128 analyses on each of 285 samples) were compiled and evaluated. In general the report provides convincing evidence that Du Pont's present treatment facilities do an excellent job of priority pollutant control.

Data from activated sludge facilities provide one example of this control. Du Pont now treats essentially all of its discharges from the Organics, and Plastics and Synthetics Manufacturing Point Source Categories by activated sludge technology. The study showed that concentrations of 300 ppb or less (proposed as the BAT limit for priority pollutants in another industry) were achieved in 99.6% of the analyses on 23 samples of activated sludge effluents.

The Du Pont Company believes that not only activated sludge but also the other biological and physical-chemical treatment practices employed at our plants are doing the job for priority pollutant control. The median analytical result for all final outfalls is less than 20 ppb for each pollutant which was detected. The frequency at which pollutants were found at levels above 1,000 ppb was 0.3% of all final outfall analyses when those not detected are included in the calculation.

The analytical methods used were intended more for screening effluents for the presence of various compounds, rather than a precise determination of concentrations. Consequently, the values might be stated better as detected rather than in precise numbers, especially for concentrations less than 100 ppb.

APPENDIX V

The Role of the States

A major factor that must be taken into account in considering the way in which water quality standards are to be developed is the primary role that Congress has given to the states in this area. Section 101(b) of the 1972 Act provides: "It is the policy of the Congress to recognize, preserve, and protect the primary responsibilities and rights of States to prevent, reduce, and eliminate pollution, to plan the development and use (including restoration, preservation, and enhancement) of land and water resources . . . ." In addition, Section 303(c), like Section 10(c) in the 1965 Act, directs the states, and not EPA, to consider certain factors in developing water quality standards. Although Section 303(c)(2) requires the state to submit its standards to EPA for approval, EPA's power of review is limited to cases where, under Sections 303(c)(3) and (4), a state's standards are determined by the Agency to be inconsistent with the requirements of the Act.[1]

The reasons Congress placed primary responsibility for developing water quality criteria and standards on the states are also evident from the Act. The uses and criteria to be established for individual water segments may only be

---

[1] See A Legislative History of the Water Pollution Control Act Amendments of 1972, Cong. Research Service, Comm. Print No. 93-1, 93rd Cong., 2d Sess. 792 (1973).

derived from hydrological and biological data specific to the particular water segment involved. Congress has recognized that this job is better accomplished by the states on an individual basis with review by EPA, rather than by EPA on a national basis.

Congress was also concerned, as evidenced by Section 101(b) above, to protect states' rights to exercise traditional land-use powers. Section 101(g), added in 1977, states a complementary policy: "that the authority of each state to allocate quantities of water within its jurisdiction shall not be . . . impaired by this Act." The amount of water available for allocation is, of course, directly related to the permissible uses of that water segment. If EPA determines that use, states' authority to allocate water would be impaired in contravention of the Act. Section 101(g) was intended to clarify, not change, existing law,[1] and thus supports the view that the 1972 Act, like its predecessor, establishes a regime of multiple uses determined by individual states.

Even beyond water rights, designation by the state of permissible uses of water directly affects the uses of lands adjoining the water. Such land planning is clearly within the traditional authority of individual states -- authority Congress did not intend to circumscribe. EPA

---

[1] See A Legislative History of the Clean Water Act of 1977, Cong. Research Service, Comm. Print No. 95-14, 95th Cong., 2d Sess. 236 (1978).

recognized this fact when it announced its 1972 water quality criteria:

> The fundamental point of departure in evaluating criteria for water quality in this Report is that the assignment of a level of quality is relative to the use man makes of that water. To evaluate the quality of water required for various uses, it is essential to know the limits of quality that have a detrimental effect on a designated use. As a corollary, in deciding whether or not water will be of suitable quality, one must determine whether or not the introduction into, or presence of any material in the resource, interferes with, alters, or destroys its intended use. Such decisions are subject to political, social, and economic considerations.[1]

Despite granting individual states primary responsibility for developing water quality standards, Congress has allotted EPA two important roles in this area. The first is the limited supervisory function under Sections 303(c)(3) and (4) under which EPA exercises review functions over the requirements of the Act. EPA's second role involves the assembling and dissemination of information under Section 304(a) of the Act. Congress recognized that states must have access to current scientific and technical information, and that resource limitations and the burdens of duplication warranted placing responsibility upon EPA in this area. However, Section 303(c) of the Act preserves the primary role of the states in establishing water quality standards.

Mr. ROE. Please proceed.

TESTIMONY OF ROBERT A. MATTHEWS, CHEMICAL MANUFACTURERS ASSOCIATION

Mr. MATTHEWS. Thank you, Mr. Chairman and members of the subcommittee.

I am pleased to be appearing this morning on behalf of the Chemical Manufacturers Association to discuss with you possible amendments to the Clean Water Act. I will try to focus my remarks this morning on what we perceive to be the most critical amendments that Congress might consider in this reauthorization process.

CMA has frequently stated its belief that the Clean Water Act should be amended to provide for alternative mechanisms for implementing increasingly stringent effluent limitations. For those dischargers that go to publicly-owned treatment works, the indirect dischargers, we believe such a mechanism is one that would avoid redundant treatment by allowing POTW's to establish and implement local pretreatment programs, which would be designed to protect the environment, in lieu of the national categorical pretreatment standards.

For direct dischargers, CMA believes that the proper mechanism is one that would avoid treatment for treatment's sake by allowing permittees the opportunity to demonstrate that modified limitations would continue to protect receiving water quality.

I would like specifically to focus on the next level of technology requirements we are facing, the best available technology, or BAT, requirements which have been or soon will be established for all of industry, including CMA member companies.

CMA believes that since the passage of the Clean Water Act Amendments of 1972 and 1977, new facts have created new imperatives which Congress should act on. Today, we know a lot more than we did in 1977 about the effective control of toxic, or priority, pollutants. As required by the statute, by 1977 industry had installed the first level of technology requirements, the best practicable control technology, or BPT. These controls have removed large quantities of pollutants, as evidenced by both EPA and industry data. For example, the data from the 1982 CMA/EPA five-plant study demonstrate that high rates of removal of priority pollutants are achieved by the kinds of well-operated and well-maintained biological treatment systems that were installed to meet BPT. Indeed, the removal rates for many of these priority pollutants exceed 99 percent.

In testimony before this subcommittee last year, the Business Roundtable presented data indicating that the industrial point sources contribute a relatively small portion, on the order of 3 to 10 percent, of the nationwide discharge of priority pollutants. As a result of both this relatively low contribution and the high levels of reductions achieved through BPT, the Business Roundtable data also indicated that the imposition of BAT will achieve only an additional reduction of 2 to 3 percent of priority pollutants in our Nation's waters.

Additionally, we have significantly improved our ability to assess the presence and impacts of priority pollutants in our receiving waters. We can now detect such pollutants in extremely small quantities and we have tools such as biological monitoring which are now available as screening devices to identify areas where there may be discharge of toxic pollutants in toxic amounts.

These then are some of the 1983 facts. Let me describe to you what CMA believes to be the 1983 imperatives.

All of industry must now install BAT. They must do so without regard to the high rates of removals they are currently achieving. More significantly, they must do so without regard to whether those further reductions will have any beneficial effect on receiving water quality.

CMA believes that the Clean Water Act should contain a mechanism to allow plants to demonstrate that modification of the BAT requirements will not create a risk of harm to the receiving water quality. We believe that the use of such a mechanism would be limited, but would at least provide a plant which faced a costly BAT requirement with the opportunity to present evidence that meeting those requirements would not result in a discernible water quality benefit.

I would like to illustrate this concern by way of a BAT-related problem facing one of Union Carbide's plants. This location currently discharges on the average 0.5 pounds per day of phenol. In order to achieve on a consistent, enforceable basis the proposed BAT limitation applicable to it for phenol, the plant has estimated that this will require a capital investment of over $2 million. And that is essentially to meet a zero discharge requirement.

Will the receiving water be better protected if this $2 million is spent? If the answer is "no," this is treatment for treatment's sake. Unfortunately, the Clean Water Act does not allow this issue to be raised. CMA believes it should. We believe the act should be amended to allow a plant to demonstrate that a modified BAT provision will satisfy all water quality requirements, including the protection of the designated use of the receiving water.

My written testimony contains a detailed analysis of how such a BAT modification program would work. I will now highlight certain aspects of that program.

First, the entire burden of generating the information to be considered in a modification request, and of demonstrating that the plant qualifies pursuant to the modification criteria, the entire burden would be on the permittee.

Second, the modification process would be on a pollutant-by-pollutant basis. That is, the permittee's BAT requirements could only be modified for those pollutants for which the permittee met the burden of demonstrating that that pollutant would pose no unreasonable risk of harm in the receiving water.

Third, a successful BAT demonstration would never relieve the permittee of meeting the baseline BPT and water quality derived limitations.

And finally, the granting of a BAT modification request would not be cast in stone. Additional monitoring imposed as a condition of the granting of the modification request could generate information indicating that there were in fact unreasonable risks of harm

in the receiving water. Or simply, a State could upgrade the designated use of the receiving water. In either event, the BAT modification could be withdrawn. Accordingly, we believe that the act should allow a modification of BAT limits in appropriate cases to avoid treatment for treatment's sake.

CMA urges that this subcommittee seriously consider the BAT modification proposal.

I will be pleased to answer any of your questions.

Mr. ROWLAND [presiding]. Mr. Stangeland.

Mr. STANGELAND. Thank you, Mr. Chairman.

Mr. Matthews, you discussed a problem facing a Union Carbide facility and the high cost to achieve a minimal phenol reduction. I expected you to tie that into the impact of that plant's receiving waters.

Could you explain that for us?

Mr. MATTHEWS. Yes, I could.

That really gets to the heart of the problem. That is the very question that we would like to be able to ask and are not permitted to ask under the present structure of the act. At that plant location in particular, the fact is that the phenol discharge creates absolutely no impact in that receiving water. We would like to be able to make that demonstration. We think we could sustain the burden in that particular plant and avoid spending $2 million.

Mr. STANGELAND. As I understand it, you are in favor of abolishing national pretreatment standards?

Mr. MATTHEWS. No, not at all. We advocate, and this is set forth in detail in the written statement, but we advocate that local—that POTW's be allowed to establish local pretreatment programs. However, there again, they have to meet criteria in order to be granted that option. If they failed to meet those criteria, then the discharges going into those POTW's would be required to comply with the national categorical standards so there would still be a place for those standards.

Mr. STANGELAND. Are we in a position to determine the direction to take in toxics control after BAT implementation?

Mr. MATTHEWS. CMA believes we are not yet in a position to know where we should go after BAT is implemented. We firmly support the notion that there should be studies done now and over the next few years as some or all of BAT is implemented. Indeed, we think those studies should focus not only on point source related problems but nonpoint source related problems as well.

Mr. STANGELAND. Can you tell me what the Chemical Manufacturers Association's problems are with both BAT and BPT deadlines?

Mr. MATTHEWS. I guess two. First, the most obvious one is the one we are facing right now, and that is the 1984 deadline which all of us are going to have—well, basically, we cannot comply, with the agency yet to promulgate our standards. I think, more to the point, we have seen proposals in various bills that would stretch out compliance to as late as July 1, 1987. We still feel that that is just not enough time. As I mentioned, EPA has not yet promulgated a number of the regulations, these guidelines, and indeed, for the chemical industry, will probably not do so until the end of next year, the end of 1984, or conceivably not until 1985.

We are concerned that July 1, 1987, will once again bring us and the agency back before Congress in a few years saying that we really cannot meet that and we would like—we suggest that recognition of that problem, the real world problem, be made today, and that the deadlines be extended to July 1, 1988, instead.

Mr. STANGELAND. Thank you very much.

I will yield back.

Mr. ROWLAND. Thank you, Mr. Stangeland. Mr. Moody.

Mr. MOODY. Yes. Thank you, Mr. Chairman.

Since many States do not have water quality criteria for toxics, how would the company show that its pollutants did not harm human health and aquatic life?

Mr. MATTHEWS. Well, our program, as I mentioned, is set forth in writing in some detail. It starts with those instances where there are such water quality standards and there we would have a straightforward demonstration.

Your question gets to those instances where there are not. No. 1, we encourage the States to go about the business of doing that. Nevertheless, in the short term, we assume we will be facing situations like that.

As I mentioned, we think there are a number of tools available to us. One of them is biological monitoring. There is also an awful lot of data out there. In fact, EPA, as it was required to do by statute, published guidelines under section 304 of the act on water quality criteria, and therein lies the large body of data on levels affecting aquatic organisms and levels at which there are human health effects, and we believe that that would be a starting point for any consideration of the BAT modification.

Mr. MOODY. Is it not true that biomonitoring is extremely expensive and does not measure human health effects?

Mr. MATTHEWS. Well, the answer to the first question is yes. Biomonitoring can be an extremely expensive proposition. That is one of the reasons why we do not believe that every one of the plants that might be eligible for a BAT modification is going to go running in and get one. It is going to have to be worthwhile to spend money, to almost invite additional permit requirements that they would not otherwise be subject to.

The answer to your second question is—I believe the answer is yes, that they do not specifically—biological monitoring does not specifically address human health, and I am sure you can get scientists before you to tell you how that is extrapolated to make educated scientific guesses as to human health effects.

Mr. MOODY. Do you agree that is a serious lack, it does not measure human health effects?

Mr. MATTHEWS. I guess my response to that is that we believe that there is a lack of data on a number of substances. We believe there is a large body of data on a number of other substances. Whether biological monitoring per se is the answer to that, I do not believe that is a position we are taking.

Mr. MOODY. How about the synergistic effects of—from increasing one company's pollution discharges, when other companies would also be increasing? There is a synergistic problem where the sum may be greater than the total of the parts?

Mr. MATTHEWS. Yes. Let me just address part of what you said.

I am concerned that you said we would be increasing our discharges. Nothing in our proposal would increase any of our discharges. This is merely a proposition that would allow us to do less than we might have to do in addition to where we have come from. We are not asking to downgrade.

Mr. MOODY. Increasing these relative to some new stage.

Mr. MATTHEWS. The second point I would make is that the technology based guidelines are not premised on anybody's understanding of what the health effects are. These are purely the agency's determinations of what a company is capable of doing by way of available technology. What we are asking is that we put on ourselves the burden of making the demonstration in these very areas where there may not be enough information. Where there is not enough information, we would suspect that the agency is going to deny the request on that basis. Again it is a reason why we do not believe that this is going to be a program that will allow 100 percent of the chemical industry to come in and get waivers. There has to be data out there to support it in order to meet that burden. And where there is not, I guess that is one of the other interesting effects. Where there is not, the BAT modification program would have a side effect of generating that information. It might indeed put a lot of information in the hands of the agencies that otherwise would not be there.

Mr. MOODY. I yield back the balance. I may have a question later.

Mr. ROWLAND. Thank you, Mr. Moody.

Mr. Packard.

Mr. PACKARD. Thank you, Mr. Chairman.

In your testimony, you indicate some serious concerns about the compliance deadlines and recommend that they be delayed.

What problem does CMA have with the deadlines?

Mr. MATTHEWS. Our problems are as I mentioned, that the proposals that we have seen which would impose those deadlines, new deadlines on July 1, 1987, we believe are already out of date; in essence, that the new schedules that we see coming out of the agency responses to the court in the NRDC consent decree litigation indicate that the chemical industry in particular would not know the targets that it must shoot at until the end of 1984, or the beginning of 1985. In that event, July 1, 1987, is simply not going to be enough time.

Mr. PACKARD. Do you think that is true for most situations or is it only true for CMA?

Mr. MATTHEWS. No, I do not believe that it is true only for CMA. The schedule that EPA has come out with, of course, has all the industrial categories that they are addressing, and a number of them, like CMA, like the guidelines applicable to CMA, will not be coming out until later next year. But I would point out these are deadlines that are "no later than." Permit writers who have guidelines that have been established and have that permit in front of them can, of course, impose deadlines "sooner than." We are only asking that, it seems to us, rather than asking us to come back in 3 years and come before you and say here we are again, we need another year, that recognition ought to be given to that real life situation that we are facing.

Mr. PACKARD. Recognizing that there are some variables involved, typically how long do you project the design and construction of a hypothetical "typical" waste water treatment control facility would take for the members of a CMA company?

Mr. MATTHEWS. Well, we will not really know that until we see the final numbers. We have had proposed guidelines out now in our industry and we have a great deal of concern with those, with the data that the agency has used. Indeed, the agency itself has gone out with a massive new request for more information. We do not know the targets yet. Based on what they have proposed, we have some ideas, and many of our plants are working on it now, how would we go about doing it, what kind of equipment would we apply to individual situations. Those are really case-by-case determinations.

Bear in mind that the chemical industry, unlike some others, is made up of plants each of which is so much different than the next one. They are made up of different product lines and, therefore, single numbers applicable to the entire industry require individual solutions at each location. It is awfully difficult for me to sit here today and tell you as a general rule how long it is going to take.

Mr. PACKARD. Not even a range?

Mr. MATTHEWS. Well, I think as a general rule in the past it has taken anywhere from 2 to 3 years to design and construct, debug these facilities and come up with a system that is in compliance with the standards.

Mr. PACKARD. Thank you, Mr. Chairman.

Mr. ROWLAND. Thank you, Mr. Packard.

Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman. I just have one question.

You spoke in your testimony, Mr. Matthews, about the interplay between a Federal regulatory system, which as I understood it you contemplated there would be under your proposal—an overlay, if you will, of a Federal regulatory scheme or Federal standards and criteria—and a local option under which a local jurisdiction or municipality could indicate that they would monitor the situation and have reasonable standards.

Could you amplify that a little bit, how you see the interplay between the Federal standards and the local jurisdiction or local standards?

Mr. MATTHEWS. If you are speaking specifically of the categorical standards, the numerical standards which are in the current act, certainly our proposal would not change that. Merely this, there would be some municipalities who would have to meet—that could meet the criteria that would be set forth in the statute pursuant to our proposal, who would satisfy those criteria and would be given the option then of establishing, implementing a local pretreatment program.

For those localities, those municipalities would decide what their needs were based on what the agency determined are the effluent limitations for the POTW, based on sludge management programs that they might be involved with and so on, and on the basis of those local factors, they would then decide what the requirements were for the individual dischargers to the POTW.

20-955 O—84——124

For those municipalities on the other hand who would not qualify, those dischargers would continue to be subject to the categorical numerical limitations, the Federal limitation.

Mr. CLINGER. Thank you.

Mr. ROE [presiding]. Mr. Stangeland.

Mr. STANGELAND. I have one more question for you, Mr. Matthews.

Once the effluent guidelines regulations have been issued, are you at that point in time able to know what specific technology will be required for any given plant to comply with those regulations or must you await negotiations of your NPDES permit for design and construction of the treatment facility?

Mr. MATTHEWS. Well, the answer I suppose is yes and no. The guidelines certainly are going to be a major component of what we are going to have to do by way of construction. But in a real sense, the answer is until you know what the permit writer thinks those guidelines mean, until you know what other limitations he may think are applicable to your plant beyond those described in the guidelines, and until you know what the State or EPA is going to propose by way of water quality derived limitations, you really will not know what the final target is. And while you can start to work about it, and think about what it is that you are going to need to do so that you can anticipate that final permit moment, in other words, you really do have to wait before you commit the dollars and know how long it is going to take you to finish the job.

Mr. STANGELAND. How long is the average to get that permit written? How long does that negotiation take?

Mr. MATTHEWS. Well, I suppose it varies tremendously. If we are talking about from the moment the permit writer actually picks up that permit and starts working on it until the permit is finalized, I would say on the order of a couple of months elapsed time, not necessarily of man-months of time but it generally is on that order.

Mr. STANGELAND. So if we are going to change the dates of compliance, would not we be better off rather than to set a date specific, to choose a certain period of 2 or 3 years after the signing of the permits or after the promulgation of the regulations?

Mr. MATTHEWS. We have seen two proposals. One with a fixed date and one with 3 years from promulgation. Three years from promulgation has generally been understood to be the guidelines. We think in fact the solution would be 3 years from the date the permit is written.

Mr. STANGELAND. Thank you.

Mr. ROE. Any further questions?

We want to thank you very much for your testimony this morning. We appreciate your being with us.

The committee will recess for about 10 to 15 minutes. We have to go vote and then we will come back and we will conclude the other two witnesses that are pending.

The next witness is Mr. Charles D. Malloch, is that correct, from the Monsanto Co.

All right, we will be back as soon as we vote.

[Recess.]

Mr. ROE. The committee will reconvene and our first witness is Mr. Charles D. Malloch from Monsanto Co. We want to welcome you to our committee hearings.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

Written Statement of Charles D. Malloch on Behalf of Monsanto Co.

Mr. Chairman and members of the subcommittee, I am Charles Malloch, Director, Regulatory Management for the Monsanto Company. I am here to speak to you on behalf of my company concerning proposed amendments to the Federal Water Pollution Control Act (hereafter referred to as the Act). Monsanto employs about 38,000 employees and operates some 60 plants in the United States, with annual sales of over 6 billion dollars. Over forty of these plants have waste water discharges. Half of these are directly treated by Monsanto, and the balance are treated by publicly owned treatment works (POTW). Our facilities range in size from large (5,000 employees) to extremely small (20 employees) so we can bring the perspective of both large and small dischargers in addressing potential amendments to the Act.

This statement outlines the major changes we recommend to improve the Act's effectiveness and to meet the needs of the 1980s. My oral comments will address only one of these issues, namely the need for a new regulatory approach to pretreatment of industrial wastewaters. Monsanto believes that local control of pretreatment programs is both necessary and makes environmental sense. I will discuss a case example to support our beliefs. Following the details on the pretreatment issue are summary statements of the other major changes we recommend be made to the Act.

PRETREATMENT

Under the current Act, industrial dischargers into POTWs must meet national technology based pretreatment standards. Congressional intent behind this was to prevent interferences with the operations of the POTWs and to guard against pass through of waste that POTWs are not able to treat. In response to this mandate, EPA has developed a cumbersome and complex pretreatment program. The foundation of this program is the issuance of national technology based pretreatment standards applicable to dischargers of toxic and nonconventional pollutants. The standards are based on pollutant removals that can be achieved by industrial subcategories using best available technology (BAT). In developing these

categorical standards, EPA has not given proper consideration to the extent to which municipal POTWs effectively remove pollutants, or to the wide variations and mix of industrial and commercial discharges fed to individual POTWs. Such nationwide standards require industrial dischargers to pretreat their waste, even where a POTW is meeting its NPDES permit limitations and where no water quality or other environmental problems require further reduction of pollutant discharges. Monsanto believes that additional, redundant and costly treatment brings no environmental benefit, while penalizing industrial dischargers.

Although EPA's general pretreatment regulations provided for a "removal credits" formula for industrial dischargers to avoid redundant treatment, this formula has not been successfully used. As a matter of fact, the Association of Metropolitan Sewage Agencies (AMSA) has stated in various papers to EPA and at conferences that removal credits would not be granted in most cases because of the complexity and burdens of EPA's regulations.

In addition, in 1980 testimony before the House Subcommittee on Oversight and Review of the Committee on Public Works and Transportation, one municipal witness claimed that "the restrictions and difficulties involved in the granting of removal credits leads to the conclusion that the EPA was never serious about allowing removal credits to industry".[1]

On September 28, 1982, EPA proposed revisions to correct the removal credit program of its General Pretreatment Regulations at 47 Federal Reg. 42698. These proposals fail in at least two important aspects to remedy this situation. First, they make the removal credits available only to a select class of POTWs: those who have an approved local pretreatment program. Since many POTWs do not meet this criterion, the regulations exclude them altogether from the removal credits program. Since Section 307 (b) of the Act makes no reference to Section 402 (b)(8) or to the pretreatment programs, setting this as a condition for application of the removal credits is inappropriate. Second, the

[1]"Implementation of the Clean Water Act", Subcommittee on Oversight and Review, House Committee on Public Works and Transportation, Committee Print 96-71, 96th Cong., 2nd Sess. (1980).(pg.42).

proposed revisions to the Removal Credits Section only set National Removal Rates (NRR) for a small number of toxic pollutants - seven metals and cyanide. These pollutants constitute only 6% of the 129 priority pollutants and exclude the large numbers of organic pollutants that are so effectively treated by biological treatment systems (i.e. secondary tratment). For Monsanto, the EPA proposed rules do not improve the practical operation of the credit program. We contend that an industry discharging to a POTW should be given 100% removal credit for a pollutant if the POTW is capable of treating that pollutant to the level equivalent to the applicable categorial standards.

The concerns by local POTW authorities who must implement the EPA pretreatment rules and the problems with EPA proposed removal credit rules will lead to the installation of redundant treatment by industry. It will be virtually impossible to obtain credit for pollutants routinely and normally removed in POTWs. Monsanto has over 20 plants discharging to POTWs ranging in size from 0.1 to 7.0 million gallons per day of wastewater discharged. The priority pollutants in these discharges range from none to quite a few. The Monsanto discharges represent, in many cases, only a small fraction of the POTWs load, while in some cases they take up a significant part of a POTW's treatment capacity. Local option and control is mandatory if redundant pretreatment is to be avoided and to foster effective, workable agreements between municipalities and their industrial dischargers.

To provide a unique example of a situation where pretreatment could be required because of regulation, but in fact is not necessary because of the removal capability of a POTW, I cite Monsanto's Sauget, Illinois plant which discharges to a POTW. Currently under construction is a new regional POTW serving the Metro East St. Louis area, which consists of a connected population of over 85,000 people. The regional treatment plant service area will include the city of East St. Louis, villages of Sauget and Cahokia and the surrounding areas. Presently several primary and/or chemical treatment plants serve these communities. In the mid-1970s these communities and a number of their industrial dischargers began working to develop a regional waste treatment plant concept. The municipalities and the industrial sources were seeking the most efficient and cost-effective manner to provide needed secondary treatment capabilities. Without the combined efforts of these groups, the treatment plant would not become a reality, since

these communities are in an economically depressed area. The regional waste treatment plant will be funded 78% by federal grants and 22% via industrial revenue bonds for the municipal/industrial share. Since the city of East St. Louis has an extremely poor credit rat'ng, the bond council determined that the industrial participants as a group had to provide corporate commitments for repayment of the total debt in the event of a default by any/all users. Through this joint municipal-industry arrangement and cooperation, the new treatment plant was designed and is under construction to provide primary and secondary treatment for the combined municipal-industrial wastewaters.

To design the new regional plant, extensive laboratory and pilot plant scale testing was conducted which confirmed that the POTW will have removal efficiencies of over 99% for nearly all of the priority pollutants which will be in the influent. Attached is a copy of a summary discussion of this waste treatment facility in which Table IV shows this removal capability (Attachment A). As a result, Monsanto and other major industrial users do not need to provide pretreatment to assure that the POTW effluent meets the requirements of the Act.

However, EPA has not been able to assure the industrial dischargers that, once the regional POTW is on line, that the construction of pretreatment facilities may not be necessary. The attorney representing the Village of Sauget, the lead municipality for this combined treatment works, sent a memorandum to EPA requesting their assurances that as long as "the effluent from the regional plant meets the categorical pretreatment standards (applicable to industries discharging to it), the industries will not be required to install pretreatment." On December 8, 1982, EPA's response letter stated, "after carefully considering your request, we have determined that the Clean Water Act and the regulations implementing it do not provide sufficient flexibility to respond affirmatively to your request" (Attachment B). EPA went on to state that "the Act and regulations provide a removal credit mechanism to adjust those standards based on actual removal of pollutants by the POTWs." EPA elaborated on this point in this same letter. The city of Sauget's attorney responded to EPA's removal credit formula proposed in the Federal Register of September 28, 1982 (47 FR 42698) and discussed the effects of this proposal on the new regional POTW (Attachment C).

As a result, industrial dischargers have no assurances that they will not later have to put in pretreatment at their own plants. These industries are guaranteeing the funding of a significant portion of the cost of this regional facility, and in the case of my own company, its financial commitment will approach over 60 million dollars over the next 18 years. This past year when we made this financial commitment, we did so anticipating that a change in the law would occur to solve the pretreatment problems (see Attachment D). If we are required to put in pretreatment facilities at our Sauget plant, we will have to install significant capital for facilities which would be redundant to the removal capabilities of the regional plant.

This regional POTW is an excellent example of industry/municipal cooperation resulting in the construction of a cost-effective, first-class facility designed to meet the requirements of the Act and would not now be under construction without industry support. However, the incentive for industry to financially aid the municipalities is gone if it is necessary for these industries to provide redundant pretreatment facilities.

Other examples supporting pretreatment revisions to the Act are contained in testimony before Congress by a number of groups, such as the Association of Metropolitan Sewage Agencies, the Association of State and Interstate Water Pollution Control Administrators, the Chemical Manufacturers Association, the Business Roundtable, the Synthetic Organic Chemical Manufacturers Association and the American Petroleum Institute (see 1982 House hearings). Monsanto encourages the subcommittee to consider changing the Act to allow local control of pretreatment programs so that pretreatment needs could be set by each POTW.

The Act should be amended to allow a POTW to request EPA, or where appropriate the State, for approval to use an alternate local control program at any time that they can determine its beneficial need. Once the request is received, there should be a stay on implementing the categorical pretreatment standards until the request is granted or denied. The decision on the request should be made by EPA in a specified time period, as an example 180 days.

This local control program alternative should operate in lieu of the EPA categorical standards where the POTW demonstrates in the request that it meets the following requirements:

- The POTW has or will develop and implement an acceptable local pretreatment program to control industrial dischargers as necessary to avoid interferences, pass through and sludge disposal problems.

- The POTW has to be achieving secondary treatment or is on a schedule of compliance.

- The POTW has to bear the responsibility to address and handle any particular problems confronting its treatment system.

- The POTW has adequate funding and other resources to implement the local program.

The NPDES permit required of all POTWs should assure that the POTW meets required treatment and water quality standards. Since each POTW has its own unique set of local conditions, it is in the best position to determine pretreatment needs to meet local compliance problems and to protect its treatment system. Rigid national standards do not allow flexibility to address different local situations.

There are obviously some local POTWs which are not able to develop local pretreatment programs due to lack of resources or other reasons. In these cases, the EPA categorical pretreatment standards could continue to be used.

Allowing the alternative for the pretreatment program to operate under local control has the advantages of (1) focusing on particular local problems that in the past may have been ignored, (2) not requiring redundant treatment, and (3) allowing a POTW to develop local solutions consistent with its need to meet its NPDES permit's effluent limits while retaining an oversight role for the states and EPA. It should be the responsibility of the POTW and its industrial dischargers to demonstrate that the POTW's treatment capability and pretreatment program will meet NPDES permit limits. Amendments which encourage local control of pretreatment programs for the strengthening of municipal-industrial cooperation will provide economical and appropriate treatment of their combined wastes in the local POTWs.

BAT AND BCT LIMITATIONS

Monsanto recommends that the Act be amended to provide the following changes affecting EPA's categorical effluent limitation programs. These are only summaries of the recommended changes and if the subcommittee wishes additional information, we would be glad to provide it.

- Modifications - Uniform implementation nationally of BAT/BCT controls is not necessary to achieve good water quality and will result in many cases of treatment for treatment's sake. Controls currently in place to meet BPT requirements are doing, in many instances, an effective job of removing priority pollutants. In those cases where a discharger can demonstrate to the permitting authority that controls already in place reduce discharges of pollutants to an acceptable level, these industry sources should be allowed to modify the effluent limitations. Monsanto supports the BAT/BCT modification scheme being advocated by the Chemical Manufacturers Association.

- Deadlines - Compliance with BAT and BCT effluent limitations is required under the current Act by July 1, 1984. Monsanto supports an extension of this deadline to at least July 1, 1988, or three years after issuance of an applicable categorical effluent limitation, whichever is later. To date, EPA has only issued a few categorial effluent limitations which apply to Monsanto. As such, the uncertainty over those yet to be issued has us concerned that we will not have sufficient time to meet these limitations. An extension of the deadline in the manner described above, would overcome this problem.

- Staggered Deadlines - Certain major Monsanto plants will be required to meet effluent limitations under more than one of the categorial guidelines. As an example, we have a plant which is covered by the pharmaceutical, pesticides and organic guidelines. With the staggered promulgation dates of these guidelines, and with a common treatment unit serving the entire plant site, Monsanto will likely be faced with redundant modifications to its facilities as each guideline is promulgated.

Monsanto encourages amending the Act to provide that where more than one categorical guideline applies, that the permit limitations be modified only after the last guideline is issued. This will provide more efficient and cost-effective use of resources to meet the requirements of the Act.

CONCLUSION

Although Monsanto could recommend other changes to the Act, the above categories represent major changes that would improve the Act's performance during the 1980s. Monsanto is committed to ensuring that its manufacturing sites operate in an environmentally responsible manner. We welcome the opportunity to submit this testimony and are prepared to cooperate with the subcommittee and Congress in addressing environmentally sound and constructive amendments to the Act.

ATTACHMENT A

SUMMARY DESCRIPTION OF
JOINT MUNICIPAL/INDUSTRIAL
WASTEWATER TREATMENT FOR METRO EAST ST. LOUIS, ILLINOIS

The Metro-East St. Louis service area is comprised of the City of East St. Louis, the Village of Sauget, the Village of Cahokia, and the area serviced by the Commonfields of Cahokia Public Water District. The existing facilities include a primary treatment plant for East St. Louis, a primary treatment plant for Cahokia and the Commonfields, and a physical/chemical treatment plant for the Village of Sauget. The sewered population served by these three treatment plants and their respective flows are shown in Table I.

Table I. Service area requirements.

	1980	2000
Connected Population	85,200	103,200
Average Flow (M^3/S)	1.38	1.18

A study for the Metro-East St. Louis Facilities Planning Area was completed during December 1976 with the major recommendations being:

1. Treatability studies should be undertaken to verify design criteria for the proposed regional facility;

2. A combined sewer excess flow treatment facility should be constructed at the existing East St. Louis treatment plant; and

3. A new regional treatment facility should be constructed in Sauget to treat the raw wastewater from East St. Louis and Cahokia, and the primary effluent from the Sauget physical/chemical treatment plant.

In 1976 the Village of Sauget entered into an agreement with the City of East St. Louis, the Village of Cahokia, the Commonfields of Cahokia Public Water District, and the Metro East Sanitary District whereby it would construct, own, and operate a regional biological wastewater treatment plant to provide service for the Metro East area. This wastewater treatment project is being handled through the EPA construction grants program with the Village of Sauget acting as the lead agency. In July 1978 the Federal EPA approved a Step 2 regional grant which was amended to a total of $3.18 million as of June 1980. In addition, the project was awarded a Step 1 grant, in the amount of $170,000 to conduct a First Flush Study of the East St. Louis combined sewer system.

Under the Step 2 grant the consulting firm of Russell & Axon, Engineers-Planners-Architects, Incorporated, St. Louis, was selected by the Village of Sauget to: 1) conduct a bench scale treatability study and a pilot plant study; 2) develop a municipal pretreatment program; 3) develop a user charge and industrial costs recovery program; and 4) complete plans and specifications for construction of the regional treatment plant, two pump stations, and connecting force mains.

The configuration of the treatment plant, known as the American Bottoms Regional Wastewater Treatment Facility, is shown schematically in Figure 1.

Figure 1. Schematic of the American Bottoms Regional Wastewater Treatment Facility.

Wastewater from the East St. Louis sewer system will be conveyed from a new pump station through a 42 in., 1 mile long force main to the headworks of the regional treatment facility. Wastewater from the Cahokia sewer system will be conveyed in a similar manner from a rehabilitated pump station through a 30 in. force main for a distance of approximately 3 miles. These wastewaters, after mixing at the headworks, will receive conventional primary treatment constituting the first portion of the new American Bottoms Facility. The primary effluent will be combined with the Sauget physical/chemical effluent for combined secondary powdered activated carbon/activated sludge treatment.

WASTEWATER CHARACTERIZATION

Prior to commencing with the treatability and pilot plant studies, that determined the process selection, it was necessary to understand the type of wastewater to be treated.

East St. Louis is an economically depressed area with significant industrial development. Among the major users of the sewer system are: Beck Flavors, Certainteed, Chemtech Fluoride, Circle Packing, Hunter Packing, Pfizer, Inc., Morris Paint and Varnish, and Musick Plating. The major effects of the industrial wastes in the East St. Louis sewer system are to produce a sewage extremely high in iron content and in packinghouse wastes. The entire Metro-East region is located in an area protected from the Mississippi River by a levee system. High groundwater conditions exist for the majority of each year and the soil is extremely sandy. Portions of the East St. Louis combined sewer system are up to 60 years old; therefore, significant infiltration/inflow exists. Efforts are underway and will continue for several years to reduce these extraneous flows to a manageable level.

The Village of Sauget sewerage system consists of combined sewers and a physical /chemical treatment plant. Major contributing facilities are: Cerro Copper Products, Monsanto Company, Midwest Rubber Reclaiming, Amax Zinc, and Edwin Cooper. During 1977 the Village completed a physical/chemical "primary" treatment plant which will remain operational as part of the regional project as shown schematically in Figure 1. The unit processes of this treatment plant consist of rough screening, grit removal, three stage lime neutralization, polymer addition, flocculation, and clarification. The plant was constructed at a total cost of $8.67 million and was financed with industrial revenue bonds backed by the Sauget industries.

The Cahokia input to the system is characteristically domestic sewage with intermittent high loadings of settleable inert solids. These solids, mainly sand, are apparently introduced into the sewer system through cracks, open joints, and poorly sealed manholes. While the sewer system is relatively new (approximately 30 years old), its poor condition is primarily the result of high groundwater during a 1973 flood of the Mississippi River. No industry exists within the city limits of Cahokia.

Summarizing, the combined wastewater from the three communities is approximately 40 percent domestic sewage and 60 percent industrial wastewater (flow basis). The three most significant parameters observed during this study (COD, BOD_5 and suspended solids) are shown in Table II for each community.

TABLE II. Regional wastewater influent characteristics.

	Flow (m^3/s)	COD (mg/l)	BOD_5 (mg/l)	Suspended Solids (mg/l)
East St. Louis	0.53	1,040	393	1,015
Sauget Effluent	0.47	454	210	35
Cahokia	0.14	561	224	201

These numbers represent average values projected for design purposes.

TREATABILITY AND PILOT PLANT STUDIES

During the course of this project three treatability studies were completed using: 1) four bench scale activated sludge reactors, 2) a complete mix activated sludge pilot plant, and 3) a powdered activated carbon/activated sludge pilot plant. A comparison of the removal efficiencies are shown in Table III.

TABLE III - Removal Efficiency (%)

	Bench Scale Reactor Study	Activated Sludge Pilot Plant	Activated Sludge/ Activated Carbon Pilot Plant
COD	72	56	80
BOD_5	98	96	97
SS	92	35	35

PILOT PLANT COMPARISON

The conclusion from several months of bench scale treatability work and pilot plant studies indicated that it was possible to effectively treat the American Bottoms wastewater using either a strictly biological treatment system or the PACT process. The criteria indicated, based on conventional efficiency parameters, that the PACT system was the best performer.

Before making a final process recommendation, the consultant also evaluated numerous metal and non-conventional parameter removal efficiencies. Priority pollutants (non-conventional parameters) were investigated to aid in the development of a regional pretreatment program prior to construction of the treatment plant. This factor is extremely important because of the number of the industries that will be served by this project.

The CMAS pilot plant exceeded the discharge limit for iron and only marginally met the limits on lead, manganese, and mercury. Of the 72 priority pollutants detected the PACT removal efficiency was essentially equal to the CMAS efficiency. Only 37 of these substances were significant and are shown in Table IV.

After the two likely processes had been compared strictly from process and performance standpoints, a cost-effective analysis was made and a final treatment process recommendation was made for the American Bottoms project. The results of the cost comparison indicated that of eight treatment schemes analyzed, the three most economical were within two percent of each other and were thus considered economically equivalent. The final process decision was based on projected performance and reliability.

TABLE IV. Average priority pollutant removals for the CMAS and PACT pilot plants.

Parameter	CMAS PILOT PLANT Influent (µg/l)	Effluent (µg/l)	Removal Efficiency (%)	PACT PILOT PLANT[a] Influent (µg/l)	Effluent (µg/l)	Removal Efficiency (%)

[a] 4.0 hour aeration time. [b] Drinking water background exceeds 50 µg/l chloroform.
[c] Influent and effluent numbers suspect due to possible laboratory background interference.

After taking into consideration the results of the study, Russell & Axon recommended design of a PACT/Wet air regeneration system for the American Bottoms Regional Wastewater Treatment Facility. The PACT process was considered more advantageous for the following reasons:

1. Operational flexibility is available at all times to handle varying wastewater conditions;

2. It consistently met Illinois effluent standards for conventional pollutants without filtration;

3. Secondary sludge is reduced to an inert ash by the wet-air oxidation process;

4. The aeration time could be as little as 2.5 hours;

5. Color is removed to a great extent thus providing a more aesthetic effluent. Because of this it is also possible to use the effluent for plant service water.

6. The aeration time coupled with an autothermal secondary sludge destruction process will provide considerable energy savings; and

7. Chemicals are not required for secondary sludge processing and large quantities of secondary sludge (mostly water) would not be hauled from the site.

Disadvantages of the PACT system include the use of polymer, the utilization and consumption of carbon, and the use of a proprietary system which requires sole source approval.

The specific treatment scheme (Figure 2) will consist of a 1.18 m^3/s treatment plant with the following unit processes: grit removal, primary clarification, gravity sludge thickening, primary sludge vacuum filtration and secondary sludge wet air regeneration. Total construction costs for this project is estimated at about $77,000,000. Completion of the design (plans and specifications) was in June 1981 with construction started during late 1982 . Startup is scheduled to commence at the end of 1985.

In support of this project several other studies are currently underway. They are: a regional pretreatment program, a pretreatment program for the existing Sauget physical/chemical treatment plant, development of a user charge system, and a first flush study and a sewer system evaluation survey for East St. Louis.

SUMMARY

The new American Bottoms Regional Wastewater Treatment Facility will provide the Metro East St. Louis industries and communities with a pretreatment program and a secondary wastewater treatment system capable of meeting State and Federal regulations. This combination of compliance with Clean Water Act requirements and low cost is essential for the stability of the communities and retention of industry in the Metro East St. Louis area.

OFFICE OF WATER

Mr. Richard J. Kissel
Martin, Craig, Chester and Sonnenschein
115 South LaSalle Street
Chicago, Illinois 60603

Dear Mr. Kissel:

In your letter of November 30, 1982, you outline on behalf of your client, the Village of Sauget, several concerns with regard to categorical pretreatment standards and removal credits. You indicated in your letter and in a meeting with members of my staff and representatives of Region V and the State of Illinois, that the industries which discharge to the Sauget treatment facility are planning to help finance the non-federal share of the cost of a new regional treatment facility. You further indicated that their support of the new facility was based on the premise that the Sauget POTW and the American Bottoms Regional Plant would replace the need for pretreatment facilities for the industries which discharge to those plants. You stated that for the industries to proceed with their commitment to help finance the Regional plant they immediately need an assurance from U.S. EPA that, as long as "the effluent from the regional plant meets the categorical pretreatment standards (applicable to industries discharging to it), the industries will not be required to install pretreatment."

Before discussing this and other issues you raised, let me say that I support the initiatives of the Village of Sauget and its industries in undertaking a leading role in the efforts to implement the regional treatment scheme now planned for the area. EPA recognizes that an innovative publicly owned treatment works, such as American Bottoms, may serve as a partial or total replacement for pretreatment at individual industrial facilities.

After carefully considering your request, we have determined that the Clean Water Act and the regulations implementing it do not provide sufficient flexibility to

respond affirmatively to your request. Industrial categorical pretreatment standards apply at the industrial facility, not to the POTW effluent as you request. However, the Act and regulations provide a removal credit mechanism to adjust those standards based on actual removal of pollutants by the POTW. In light of the existing treatment at the Sauget plant and the planned powdered carbon treatment at the regional plant, it seems likely that removal credits could provide relief to your industrial contributors. The proposed amendments to the removal credits regulation, which you referred to, simplify this mechanism and will make it more workable. Nonetheless, without knowing what the categorical standards applicable to many of your industries will require and lacking specific information on the treatment efficiency of the American Bottoms plant once it is constructed, it is impossible to provide the absolute assurances specifically requested in your letter. Once this information is available, the need for pretreatment at the industries may be eliminated through application of removal credits, if the combined treatment of the facilities at Sauget and American Bottoms sufficiently removes the pollutants regulated in general and categorical pretreatment standards. The mechanism for this determination shall be the removal credit provisions of section 403.7 of the General Pretreatment Regulations, as amended.

In the meeting in Chicago, you raised the issue that uncertainty could be created by a "ratcheting" effect when there is a continuing modification of removal credits. I understand the problem and intend to address it in the promulgation of the amendments to the removal credit provisions.

Let me assure you that the comments you submitted will be fully considered in the rulemaking process on the removal credits proposal. EPA will continue its longstanding cooperation and efforts directed at constructing the American Bottoms Regional facility. We believe that construction of the plant will help achieve our shared water quality goals.

Sincerely yours,

Martha G Prothro

Mr. Bill Diamond
Environmental Protection
Agency
Permits Division (EN-336)
Room 3220
401 M Street, SW
Washington, D.C. 20460

Dear Mr. Diamond:

This letter is intended as comments on the proposed rules with respect to the removal credits program that appeared in the Federal Register of September 28, 1982, "General Pretreatment Regulations for New and Existing Sources; Removal Credits." 47 Fed. Reg. 42698. These comments are presented on behalf of the Village of Sauget, Illinois where the existing treatment facility and the designed regional facility could be severely impacted by the removal credit scheme as proposed. The purpose of this letter is to demonstrate the potential effect of the proposed regulations, and to describe the wastewater treatment agreements which Sauget is a party that will, in turn, be voided by this program.

1. Impact of Sauget POTW

The apparent purpose of the removal credits scheme, as authorized by Section 307(b)(1) of the Clean Water Act ("Act") is to grant to industrial users of a Publicly Owned Treatment Works (POTW) relief from the categorical pretreatment standards. This relief, in the form of "removal credits" is to be based upon the removal capability of the POTW. Because the Sauget POTW was designed to treat industrial wastes as well as municipal

wastes, the removal credit program could appear at first blush to afford the Sauget industries significant relief. However, the effect is, in fact, quite the opposite.

The existing POTW of the Village is a physical/chemical treatment facility which treats the industrial discharges from eight industries, and the municipal waste from a population of about 200. Therefore, the influent is between 98% and 99% industrial. But concentrations of substances in the discharges from the industrial plants are vastly different in composition.

The following is an example of the problem created. If the proposed removal credits scheme were applied to an industrial effluent which includes copper:

> The physical/chemical system of the Sauget POTW treats copper to 0.5 mg/l near its solubility level. This is the present effluent limitation of the POTW's NPDES permit. By using a solubility system, and by adjustments of chemicals and pH, the POTW can reduce the influent concentration of copper to 0.5. In the removal ratio formula, $\frac{I-E}{I} = r$ (proposed 403.7(b)(2)(iv)) the effluent concentration E for the Sauget POTW is 0.5 mg/l. The second element of the removal ratio is I, the influent concentration to the POTW. In the instance of a copper discharge to the Sauget POTW, the concentration could be 10 mg/l at the industrial discharge, but be 2 mg/l at the influent to the POTW. Therefore, I is 2 mg/l Using the removal ratio formula, the removal ratio is 75%, even though the initial discharge of copper was at a strength of 10 mg/l. When the removal ratio is applied to obtain the revised pretreatment standard using the formula a $Y = \frac{X}{1-r}$ (40 C.F.R. §403.7(a)(4) as proposed), the effect is obvious. If the pretreatment standard is 0.5 mg/l, then the revised pretreatment standard is 2 mg/l.

For the Sauget industry, pretreatment to 2 mg/l would be required, even though the POTW is specifically designed to remove copper to 0.5 mg/l from the industry discharging 10 mg/l of copper.

2. <u>Impact on Regional Treatment Plant</u>

The disastrous effect of the proposed removal credits scheme is further emphasized in the context of its effect on the viability of a regional treatment plant organization for which Sauget is the lead agency. To describe this relationship, and the destructive impact of these proposed regulations, a brief history of the Sauget POTW and the regional treatment plant is required.

The Village of Sauget is located in St. Clair County, Illinois, on the Mississippi River between the City of East St. Louis and the Village of Cahokia. Sauget is the site of eight industrial facilities, and has a population of 200. Early in 1972, Southwestern Illinois Metropolitan Area Planning Commission indicated that effective secondary treatment for St. Clair and Madison Counties could be provided through the development of a regional treatment facility. In 1973, this concept gained the support of both State and Federal Environmental Protection Agencies. Following extensive meetings, in 1975 representatives of St. Clair and Madison Counties, the Village of Sauget, the City of East St. Louis, and the East Side Levee District reached formal agreement to create a regional waste-water treatment authority. In 1976, Sauget submitted a proposal for funding, acquisition, construction, operation, ownership and a management of the regional treatment plant and system. Illinois EPA and Sauget cooperated in an effort to obtain the approval of the regional treatment authority. In 1977, agreement was reached with the City of East St. Louis, the Metro-East Sanitary District, the Village of Cahokia and the Commonfields of Cahokia Public Water District that would place Sauget in control of operation and ownership of the regional treatment plant.

In 1978, the Illinois Pollution Control Board granted a variance to the Sauget POTW from the Illinois BOD, suspended solids, and oil and grease effluent limitations on the basis that Sauget's effluent would eventually be treated to compliance levels by the regional treatment plant. In 1981, the Village of Sauget petitioned the Illinois Pollution Control Board for a site-specific regulation dealing with "first flush" effluent, which is predicated on the construction of the regional plant under Sauget's control. In addition, Sauget's present NPDES permit is dependent upon the eventual acceptance of the effluent from the Sauget POTW to the regional plant.

In sum, the Village with the support of the United States Environmental Protection Agency, the Illinois Pollution Control Board, and the Illinois Environmental Protection Agency, has undertaken the design, construction and operation of the regional facility.

All that would be changed by the promulgation of the proposed removal credits scheme. If the Sauget industries must pretreat to a level at or below the level of the regional plant effluent, they will have no reason to provide the capital that is essential for construction of the regional facility. And because the regional plant will receive influent from larger municipalities,

with Sauget representing about 30% of the influent, the same effects on the removal rate will be observed at the regional plant as would occur at the Village's physical/chemical plant.

Rather than affording industrial dischargers relief from categorical pretreatment standards to a POTW, application of the proposed removal credits scheme would impose an onerous burden upon industries and municipalities alike. By the use of a combined waste stream concept, the proposed regulation fails to account for efficiently designed wastewater treatment systems in municipal industrial settings. Specifically, it would force the industries of Sauget, Illinois, which constitute 99% of the influent to the Sauget POTW, to perform the same level of treatment twice. This regulation is so burdensome that, if imposed, it could result in withdrawal of the industries from support of the joint treatment system.

Even more disastrous is the potential effect of the regulations on the regional treatment plant designed to completely treat the effluent from Sauget, East St. Louis, and Cahokia. The absence of Sauget would essentially end the regional plant concept recommended by the Facility Plan. Thus, secondary treatment for Cahokia and East St. Louis would again become only a remote possibility.

Sauget appreciates the opportunity to bring this potentially disastrous situation to your attention. In addition to the documentation provided here, representatives of Sauget would welcome the opportunity to more fully discuss this situation.

Very truly yours,

Richard J. Kissel

Richard J. Kissel

RJK:ek

P.S. As we are writing these comments, Mr. Harold Baker, the Village attorney who has been involved in this project for nearly ten years, is completing the terms for the bond issue for the regional facility. That bond issue is planned to be let in mid-December. Mr. Baker has asked that we indicate to you that these proposed requirements are diametrically opposed to the understanding that has supported the Village's efforts from their beginnings to construct the regional wastewater treatment facility.

UNITED STATES
ENVIRONMENTAL PROTECTION AGENCY
REGION V
230 SOUTH DEARBORN ST
CHICAGO, ILLINOIS 60604

RECEIVED OCT 1 1982

REPLY TO ATTENTION OF:
5WQP-26

AUG 4 1982

Mr. Jack Molloy
Chairman, Sauget Research and
Development Association
Monsanto Company
W.G. Krummrich Plant
Sauget, Illinois 62201

Dear Mr. Molloy:

As requested in your June 29, 1982, phone call to Mr. Tony Holoska of my staff, this letter will highlight Federal pretreatment requirements for industries presently discharging into the Village of Sauget's treatment plant, and for those who will, in the future, be discharging into the American Bottoms Regional Treatment Plant.

The General Pretreatment Regulations (40 CFR 403) as amended on March 31, 1981, established two different sets of standards that industries must comply with: national categorical standards and prohibitive standards. The U.S. Environmental Protection Agency (U.S. EPA), pursuant to the settlement of the Natural Resources Defense Council suit, must publish standards for certain types of industries determined to discharge toxicants. These standards apply nationally and are based on Best Available Technology (BAT). Section 307(b)(1) of the Clean Water Act provides for case-by-case revisions of categorical pretreatment standards for industrial users to compensate for pollutants removed and treated by a Publicly-Owned Treatment Works (POTW). A POTW must demonstrate consistent removal and apply to the U.S. EPA Regional Office or to an NPDES state with pretreatment authority.

Presently, compliance with BAT categorical pretreatment standard is required as of 3 years from the promulgation date of the standard, but no later than July 1, 1984. Once a standard is promulgated, affected industries must also comply with reporting requirements, as specified in 40 CFR 403.12. There exist federally promulgated BAT categorical standards for Timber Products Processing, Iron and Steel, and the Inorganic Chemicals industry, with 12 others proposed (see Attachment for list of industrial categories for which BAT categorical pretreatment standards will be promulgated). Additionally, Best Practicable Control Technology (BPT) electroplating standards are in effect.

Whereas categorical standards apply to specific classes of industries, national prohibitive standards apply to all nondomestic users of a POTW. Section 403.5 of the General Pretreatment Regulations contains requirements

for the nondomestic users and the municipality. Pursuant to 40 CFR 403.5(c), a POTW, developing a pretreatment program must establish specific limitations in its sewer use ordinance to control pollutants, particularly toxicants, from nondomestic users.

In order to establish these limits, a municipality must conduct an industrial survey to determine the type of pollutants that could enter the sewer system. This activity is followed by the POTW sampling its influent, effluent, and sludges to determine the fate of toxicants. Limits established will be based on local situations with the overall objective being prevention of pass-through of pollutants, prevention of treatment plant interference and upset, and reduction of sludge contamination. Proposed local limits and their technical justification must be approved by the state and/or U.S. EPA.

Once the POTW pretreatment program is approved, the local entity will enforce its own standards as described in its sewer use ordinance, or federally promulgated BAT categorical pretreatment standards, whichever are more stringent. Cities will need to work very closely with their industries and keep them apprised of the applicable standards. Industries having to meet more stringent local standards are not bound by a federal compliance deadline date.

Reauthorization of the Clean Water Act is currently under review by Congress. A major part of the legislation proposed by U.S. EPA is modification to the national pretreatment program. Two sections dealing with industrial compliance with categorical pretreatment standards are Sections 307(b)(2) and (b)(3). Section 307(b)(2) would allow the Administrator discretion in promulgating national categorical BAT pretreatment standards. Section 307(b)(3) would allow a POTW, under certain conditions, to apply for a waiver from having to apply national categorical standards to its nondomestic users.

In conclusion, this office is very interested in the Regional Treatment Plant being constructed. We feel the new plant will have the capability to remove and treat some of the toxicants which are presently entering the Village of Sauget's treatment plant. Also, the Sauget physical/chemical treatment facility provides a unique pretreatment feature that coordinates industrial pretreatment with the regional wastewater facility. The operational success of the Regional Treatment Plant, we believe, will depend primarily on the effectiveness of the combined capabilities of these treatment facilities and the overall effective management of the regional pretreatment program. (The development of the Village of Sauget's and the American Bottoms Regional Association's pretreatment program has been reviewed and comments will be forwarded to the Illinois Environmental Protection Agency for their review).

I trust that this letter has provided you with an understanding of the present and future responsibilities of industrial facilities connected to the Sauget treatment plant and those industries who will be users of the Regional Treatment Plant.

Any questions regarding the subject matter should be directed to Bob Robichaud (312) 353-2105, Regional Pretreatment Coordinator.

Very truly yours,

Charles H. Sutfin
Director, Water Division

Mr. ROE. Please proceed.

TESTIMONY OF CHARLES D. MALLOCH, DIRECTOR, REGULATORY MANAGEMENT, MONSANTO CO.

Mr. MALLOCH. Thank you, Mr. Chairman, members of the subcommittee.

I am a director of regulatory management for Monsanto. I am here today to speak on behalf of my company concerning our recommendations for proposed amendments to the Federal Clean Water Act.

Monsanto is committed to insuring that its manufacturing sites operate in an environmentally responsible manner. As a result of this commitment, and our experience in the past decade with the Clean Water Act and the regulations implementing it, we appreciate the opportunity to share with you our recommendations for improving the act's effectiveness so that it can meet the needs of the 1980's.

My written statement addresses certain concerns on issues connected with BAT and BCT limitations and I will not address those in my oral testimony. Instead, I will spend the next few minutes briefly summarizing why we believe local control of pretreatment programs is both necessary and makes environmental sense. Many times in the past decade Congress has heard about the cumbersome and complex pretreatment program developed by EPA and now in some degree of implementation.

EPA's regulations focus on the establishment of pretreatment standards equal to best available technology requirements. These requirements are largely redundant with the removal of priority pollutants by POTW's. To avoid such redundant treatment by industry and POTW's, Congress in 1977 added a specific provision authorizing the granting of credits to reflect the removal of pollutants by POTW's. Unfortunately, removal credits remained a fiction. Municipal authorities have found EPA's removal credit program to be cumbersome and unworkable.

We believe that POTW's are in a good position to control industrial users as needed to meet local permit and sludge disposal requirements. Such local controls allow resources to be targeted on specific problems where they exist. That is why we favor an amendment which would allow POTW's which qualify to implement alternate local programs in lieu of national pretreatment standards.

To provide the subcommittee with an informative example of a situation where pretreatment could be required because of regulation, but in fact is not necessary because of the removal capability of a POTW, I have in my written testimony presented a case history of Monsanto's Sauget, Ill., plant which discharges to a POTW.

In this case, three municipalities, East St. Louis, Sauget, and Cahokia, Ill., and their major industries have worked together to meet the mandates of the Clean Water Act to improve the environmental quality of the areas in which they are located. I will not cover the details of this program for you orally today but I hope as you read my written testimony you will be impressed with the fact that without this joint municipal, industrial cooperation the new

$77 million treatment plant designed to handle a combined waste load would not today be under construction and on schedule for startup in the next 2 years. However, even though this plant is specifically designed to treat the combined waste identified in my example, EPA stated in a letter to the regional plant authority that the act does not provide sufficient flexibility to overcome the need for redundant pretreatment facilities by the industrial dischargers once the plant is operating.

The industrial dischargers came forward with financial commitments to bring this treatment facility into existence. If industries must construct redundant pretreatment facilities once the POTW is online, we have no incentive to develop innovative and effective waste treatment facilities collectively with the municipalities.

Congress now has the opportunity to work out an acceptable amendment to change the law to solve these pretreatment problems. We recommend that the act be amended to allow POTW's to request permission from EPA, or the States where appropriate, to use an alternate local pretreatment control program when they qualify.

The request for an alternate to categorical limitations should state that the POTW meets the following requirements:

First, the POTW must have or will have an acceptable local pretreatment program to control industrial discharges as necessary to avoid interferences, passthrough and sludge disposal problems.

Second, the POTW must be achieving secondary treatment or must be on a schedule of compliance.

Third, the POTW must be responsible for addressing and handling any problems confronting its treatment system.

And finally, the POTW must have adequate funding and other resources necessary to carry out the local program.

The pollution discharge permit required of every POTW should assure that it meets the required treatment and water quality standards. Since each POTW has its own unique set of local conditions, it is in the best position to determine pretreatment needs to accomplish local compliance and to protect its treatment systems.

Obviously, some local POTW's will not be able to develop pretreatment programs due to the lack of resources or for other reasons. In these cases, the EPA categorical pretreatment standards should continue to be used.

In addition, until such time as the POTW requests EPA authority for an alternate system, the EPA categorical pretreatment standards should remain in effect and be enforced. However, once EPA receives a valid request for local authority, EPA should stay the categorical standards for that POTW while it reviews the request and if approved, then until the local program is in operation.

We strongly encourage the subcommittee to review the many testimonies urging that the pretreatment requirements of the act be amended to improve their effectiveness and workability. The option of returning the pretreatment program to local control would have numerous advantages and go far in fostering improved water pollution control cooperation between municipalities and their industrial dischargers.

Thank you for this opportunity to express my company's views on this point, and I would be happy to answer any questions.

Mr. ROE. Well, I want to thank the gentleman for his testimony. The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman.

Mr. Malloch, how long will it take for a POTW to request an alternative local pretreatment program, have it approved or denied and if approved, be operational?

Mr. MALLOCH. Well, it will vary somewhat in total time. But the POTW must, of course, in its request for the alternate program meet the various demonstrations I laid out in my testimony. In many cases, most of the demonstrations can be met today by many POTW's that already have pretreatment programs in effect and have secondary treatment. In other cases it may be a while before a POTW will be in a position to make all portions of the demonstration.

However, once the request is submitted, and as I have stated in my written testimony, I think there should be some specific time limit set for the EPA to review the request and make a decision to grant or deny it. I recommended approximately 6 months or 180 days for that period. After that, in many cases the system ought to be able to be operational very quickly within a matter of months.

Mr. STANGELAND. Does the local control pretreatment program you propose delay the installation of pretreatment facilities by industry?

Mr. MALLOCH. Not at all. In the case of a POTW that chooses not to go for an alternate system, obviously the categorical standards would still apply and would still be enforced and would have to be implemented in the appropriate time period.

In the case of a POTW that did decide to apply for the alternate system, once they have met the conditions to apply, then for that particular system, and at that point in time they would have a stay on the categoricals that would then apply.

However, there are cases where some pretreatment would still be required by certain industries even in the event of having an alternate system approved.

So my basic answer is no, it should not delay it in most cases.

Mr. STANGELAND. Why do you feel that a combined industrial municipal treatment plant such as you described in your example is better than each industrial discharger having its own treatment facilities?

Mr. MALLOCH. Well, I think there are two or three logical reasons for this. Perhaps the largest reason is that if a number of individual companies and municipalities go together, they can build a first-class, well operated POTW that can treat a variety of combined waste loads.

In many cases, one company's waste can be helpful to the treating of some other company's waste. The same is true in terms of the municipal waste itself being treated. It is less expensive. I think both the municipalities involved as well as the industry users of the POTW will benefit financially by a common-type system.

The particular example in my written testimony points out that without the combined cooperation of all the folks involved in putting that together, the city of East St. Louis, for instance, would not today be obtaining a secondary treatment plant because of the depressed economic conditions in that community.

So I think there are obviously benefits for the industrial user because we would not use the POTW if it did not cost us less. But conversely, there are benefits from the standpoint of the municipalities involved. The system is obviously going to be more reliable and one sidelight that comes out of this, once there is a good combined system in place you now have a utility in an area that probably could attract additional industry to that area because a system is already in place capable of handling a wide variety of waste loads.

Mr. STANGELAND. In your testimony you speak of cumbersome and complex pretreatment programs that have been developed by EPA.

Could you explain to us what you mean by that?

Mr. MALLOCH. Well, I am going to speak predominantly from the prospective of an industrial user, since I do not work for the municipalities or POTW's.

From our standpoint, we are obviously not seeing the capability of obtaining relief from the requirement that we would have to install redundant pretreatment in our own plants. When you talk to the POTW's involved, in some cases their concern is with the removal credit formulas that EPA has in their regulations. The arithmetic connected with them and the complexity of utilizing them are so complex they are quite leery to apply them. They are concerned about excessive paperwork, excessive recordkeeping requirements, the manpower requirements, and so forth.

I think the long and short of the whole thing is where there is a POTW system that is functioning well, a local system, then we believe that a local control system that is not tied up in a great deal of redtape as a result of regulatory requirements should be allowed to function effectively without needing to handle all this redtape.

Mr. STANGELAND. If POTW's were able to control their pretreatment programs, would industry have to do any pretreatment of their wastewater discharges or would they be getting a free ride?

Mr. MALLOCH. No, I do not think anybody gets a totally free ride. There are a couple of ways of looking at this.

First of all, pretreatment is still going to be required for certain pollutants to almost every POTW, even those that have well-run systems. As an example, my testimony refers to the Sauget regional system in Illinois. Back in 1978 we installed a multimillion dollar pretreatment system in our own plant to handle mercury effluents, because the POTW system either as it will start up in the future, or the current system, will not effectively treat mercury to the limits required. This is an example of where we did have to put in some pretreatment.

Obviously where a POTW is not able to play the game, that is to get into the local system, then all industries would have to put in pretreatment to match the categorical standards as they come out. So I think these are a couple of reasons why obviously there will still be pretreatment needs.

Mr. STANGELAND. Thank you, Mr. Malloch.

No more questions.

Mr. ROE. The gentleman from Georgia.

Mr. ROWLAND. Thank you, Mr. Chairman.

Do you think that your concerns about pretreatment are being addressed by the EPA making changes in the regulations rather than having to amend this act?

Mr. MALLOCH. Well, I think the EPA's track record is such that that is not happening. The complexity and the amount of detail behind the regulations that EPA has come forward with sort of indicates that they want a heavy hand and heavy control in all of these local systems and local POTW's. The track record just is not there to show that the regulatory scheme can do it. I do not think they have a clear understanding if the true intent of Congress was to delegate the responsibility for control to the lowest common denominator, in this case the local POTW, where they can qualify. I want to make sure that is understood. I think a POTW must qualify before allowing them to have a local control system.

But where they can qualify, I think there should be a clear understanding that the intent of regulations should be to encourage that type of an operation. In other words, the local control concept.

And I am not sure today that that is a clear understanding at the agency.

Mr. ROWLAND. Do you think that the proposal that you are making for local pretreatment program will have any detrimental effect on the quality of the water?

Mr. MALLOCH. No, sir, we are not proposing any change to how you set the limitations for the POTW, that is, the discharge limitations of its effluents. Just as with an industrial discharger, as an example, where you take a sample of the effluent itself and you test it for various constituents. If you detect constituents in that particular effluent that are toxic, then you obviously set limits on those constituents. And we are certainly not advocating any change to that concept.

Mr. Matthew a few minutes ago mentioned that there are screening techniques such as biological monitoring and so forth that are available today that were not available some years ago. So I think there are numerous types of mechanisms and approaches that can be used to guarantee that we are not going to be adversely affecting water quality and we are really not advocating any change to that portion of the procedure.

Mr. ROWLAND. What do you think would be the appropriate time for a POTW to request control of its local pretreatment program?

Mr. MALLOCH. Well, there are a number of POTW's today that probably ought to be ready to apply for an alternate control system right now. There are some categorical standards that have been issued. POTW's in many cases, particularly well operated POTW's that have secondary treatment in place, basically could meet all of the demonstrations that I laid out, that I feel that they ought to make. Those particular POTW's because of the need for a local program today should apply as soon as they could.

On the other hand, there are many categorical standards that have not yet been promulgated by the agency. One of the major concerns that my particular company has is that many of those categoricals affect our operations. We are shooting at a moving target, we have no idea what in some cases they are going to look like for those some 20 plants that we have that discharge to POTW's.

20-955 O—84——126

On that basis, I think the program should be set up to give us sufficient opportunity at a later date, to work with the local POTW and for them to be able to apply for an alternate system once we know what those pretreatment standards are going to look like.

When a standard is issued the first things we do in my company is we take a look and see if we are going to have to provide any type of treatment in our own plant to meet the standards as issued. But we also go down around the corner and we talk to the POTW to determine if that POTW has the capability of removing that pollutant.

We would like, at whatever time this happens, the opportunity to be able to work with the POTW and to jointly determine how much credit we could get for the removal of that pollutant in the POTW and hopefully either reduce, or possibly in many cases eliminate, the need for installation of pretreatment in our own plants.

Mr. ROWLAND. Thank you, Mr. Malloch.

Thank you, Mr. Chairman.

Mr. ROE. I thank the gentleman from Georgia.

We have a list of four questions from Congressman Young from Missouri. We will submit those to you, if you would be kind enough to give us a response we would appreciate it.

Mr. MALLOCH. I would be very happy to.

[The questions posed by Congressman Young and responses received from Mr. Mallock follow:]

RESPONSE TO QUESTIONS FOR MR. MALLOCH ON
BEHALF OF REP. ROBERT A. YOUNG BEFORE
THE SUBCOMMITTEE ON WATER RESOURCES
NOVEMBER 3, 1983. SUBMITTED BY MR. MALLOCH
ON NOVEMBER 11, 1983.

QUESTION #1

If Congress passes an amendment such as you propose, would industry need to install any pretreatment facilities?

ANSWER

In many cases yes. Where a local POTW has chosen not to request use of an alternative local pretreatment control system, then the categorical pretreatment standards would continue to apply to local industries as today. If a local POTW does request permission to use an alternative local control system, then there may still be the need for some pretreatment by industry. This will be necessary where for a given pollutant, the POTW is not able to remove that pollutant down to the level necessary to comply with its own discharge permit. In addition, any pollutant which would interfer with, pass through or affect the sludge disposal practices of the POTW will need to be pretreated by industry.

QUESTION #2

Would the individual homeowners see increased charges as a result of this pretreatment program?

ANSWER

No, not if the POTW manages its user fee arrangements properly. Industrial users who rely on a POTW to remove their pollutants, and are therefore not required to install pretreatment, should be willing to pay a user's fee for this treatment. The user's fee should be at least equal to the incremental cost to the POTW and in many cases, may exceed the incremental costs. For a pollutant, where the costs that industries would incur through the installation and operation of their own pretreatment facilities exceed the POTW user fee charge for POTW removal of the pollutant, then industries should be willing to pay the POTW for such removal.

QUESTION #3

Why do you feel that a local pretreatment program would work better than the present national standards approach?

ANSWER

There are a number of benefits that could occur as a result of encouraging local control which would not always be available using national standards. These include: 1) cooperation between municipalities and industries should be enhanced to resolve compliance needs in a first class, efficient, and cost-effective manner, 2) both the municipalities and industries would benefit from a reduced cost base for treatment since a combined treatment system fulfilling all needs would be more reliable, cost-effective and provide a valuable utility for the community, 3) once EPA, or if appropriate the state, is satisfied with the local program parameters, then EPA or the state should spend less time administering the program as long as the local POTW complies with its approved program. For the local POTW, it should be easier to administer the local program since the complex removal credit calculations would not be necessary as long as the POTW was meeting its discharge permit limits, and 4) the local POTW's cost for removal of a pollutant could be more than offset by increased industrial user fees where the POTW treats the pollutant in place of the need for industry to install redundant pretreatment facilities.

QUESTION #4

Mr. Malloch, do you believe that the industries and the local POTW in St. Louis have established a good enough track record which would help establish that city as eligible for the local pretreatment program you describe?

ANSWER

The St. Louis POTW should be able to qualify. They have a local pretreatment program which has EPA approval. They have secondary treatment in place or under construction at all but one of their treatment plants, and that one could qualify under a schedule of compliance. The current track record demonstrates that the St. Louis POTW and its industrial dischargers work together well and should be able to qualify for the alternate control program, if they fulfill the appropriate demonstrations which I referred to in my testimony.

Mr. ROE. Are there any other questions?

We want to thank you very much, Mr. Malloch, for your valuable testimony today.

Our next witness is Mr. Thomas Allegretti, representing the American Demineralizer Co.

Mr. Allegretti, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

AMERICAN DEMINERALIZER CO
4425 W. Monrose Ave
Chicago, Il 60641
(312) 545 6650

THOMAS ALLEGRETTI

I was admitted to the bar in 1935 at the age of 21. I enlisted in the Air Corps as a private in 1942. I went to O.C.S. at Provost Marshall's school. Was Chief of Investigation for the State of Michigan for the Provost Marshall Investigation unitwhich later took over a considerable amount of C.I. C.'s work including the Manhattan Project. I was transferred to Military Government, was with the British Army for a short time and then later became Military Governor of two kreises in Germany (about 500,000 people). Later was involved in War Crimes as an attorney. I established the above facts only to show a varied experience. In 1953 I went into the ion exchan ge business and in 1957 I started recirculating plating rinses to save water and to prevent spotting.....

There are 3 basic problems facing the government pertaining to the elimination of pollution.

1 The pollution problem itself and the prevention of further contamination of lakes, wells and streams.

2. Water conservation - although water is never eliminated by usage, the sources of water may be eliminated - (a) lowering of water tables.
(b) reduction of supplies from reservoirs, lakes and streams.

3. Reduction of "haulaway", reducing land fill areas and their necessity.

As to the elimination of these problems the answers, obviously, are to re-use water, never let it leave the plant and prevent its contamination so that it can be re-used.

Again - if the cost is too high, re-use and decontamination would not be the solution.

We, at Amdec (American Demineralizer Company) sell a service wherein we supply equipment to reduce pollution to ZERO and decontaminate water so that it can be reused indefinitely. We also do this at such a savings that repayment is within a 6 month period. We also save on chemicals to further decrease re-use cost. Since we keep our pH @ 6 we reduce sludge to

that which is entrapped by our filter cartridges... thus eliminating land fills.

May I cite some examples:

1. The big 3 auto manufacturers had written Washington concerning the difficulty of compliance with the regulations. Chrysler permitted me to visit their plant in Belvedere, Illinois. At Belvedere, approximately 1000 gpm of well water is used. The plant to process this water to drain cost $ 7,000,000.00. Using interest, depreciation and operating costs, I have estimated the annual costs to be approximately $ 2,000,000.00 . By using a system such as ours we can provide them with a higher purity rinse water and @ 2000 gpm. Further, we can filter their cleaners, phosphate and chromate solutions @300,000 gph. Presently they dump their cleaner every other day but by properly developing a cleaner, the cleaner should last many months. In this type of system - no water would go to drain and Chrysler would have the use of unlimited high purity water. Water is used in their painting section and this can be treated so that it, too, can be used indefinitely or sent to drain monthly. The decontamination should be simple. The cost of such a system would be less than $ 300,000.00 per year

In plating plants we cut water consumption by 98% and seldom less than 95%. In addition we save their cleaners, their nickel salts, the copper salts, most of the chromate solutions and still give them a spot-free rinse. We do not sell them on pollution control but we sell them on saving money. Their pay back is usually from 4 - 6 months.

While in California I visited Silacon Valley - most of the plants in the computer field could easily reduce water consumption 99% and have better rinses.

I also visited a tomato cannery, here 250,000 gpd were used. The B.O.D. to drain was extremely high. Both the water to drain and the B.O.D. could be reduced 98% and pay back within 6 months. It must be remembered, in most instances, the problem is not water supply but B.O.D. to drain - and this is a problem. The sanitary district could not handle any more B.O.D. nor water.

East of the mountains in the desert, plants could use 2,000,000 gpd and not even go to drain.

Homes, by judicious use of water, could be built in the $ 30,000.00 - 40,000.00 range.

The problem again is two fold - Congress doesn't know what to do and any two votes will change its mind. In 12 years we have accomplished almost nothing and yet spent untold millions. Since Congress will not grapple with the question industry, as a whole, does nothing. This is not a completely fair statement either as many industries have spent millions and have not solved their problems, effectively. In so far as pollution is concerned I understand that even Mr. Ruckleshaus in California allowed his company to pollute. The whole fault lies in Washington. Set the laws and enforce them.

As to the enforcement - use the IRS methods. The head of the company must submit a bi-monthly affidavit as to the composition of his effluent. Periodic checks should keep him honest, if he is not, a few indictments would be a simple means of compliance enforcement.

Some years ago I read a government report listing New Orleans as having the highest incidence of cancer... the drinking water came from the Mississippi. The next highest was Aurora, Illinois its wells were contaminated by the Fox River.

The health of this nation is in your hands. The previous statement seems trite as you have had many others appear before you who have reiterated such a statement. There are solutions available and good solutions.

As yet I have not heard from Chrysler or General Motors etc and I do not expect to - what's a few million dollars. Top executives are not noted for worrying about the health of our country unless it has a profit attached thereto. Should, however, the price of their water rise some 300 or 400 %, economy might then sink in.

To summarize and suggest -

1. Raise the price of industrial water.
2. Charge industrial well users for water taken from wells.
3. Pass a law making plant managers responsible for an affidavit of contents for water going to drain.
4. Allow or continue a tax deduction for pollution control equipment.
5. Do not spend more money for sanitary districts. If industries re-use water, they would have more capacity at less cost than they can use.
6. Advertise your laws, enforce them, there has been little enforcement in the last 10 years.
7. Don't listen to cry babies.

THE U.S.NEWS WASHINGTON LETTER

A confidential weekly alert to changes that will affect you

Friday, July 1, 1983

Dear Subscriber:

WATER. Will we have enough? Clean enough? At a manageable cost? The answers to those questions are critical to the country's future. Because they are, this week's letter explores a single topic: WATER.

It begins on an ironic note, in the midst of warnings about shortages. Hard to believe with Colorado River rampaging and South still flood-dazed. Yet, long-range concern is we'll have not too MUCH but too little water. Story affects us all. Consumers. Investors. Farmers. Everybody. To see that more clearly, consider these background developments:

Fears over water quality in the United States are mounting steadily. Some scientists predict ruinous droughts, a national "water crisis." We're wasters. Typical city use by family of 4 is 346 gallons a day. Higher water bills are coming, plus higher taxes for water projects. The national thirst for the resource is climbing as population grows. Salt and toxic wastes threaten underground reservoirs in many places.

The worries are not just a western phenomenon. There's real concern about water availability even in New Jersey, with its 45 inches of average annual precipitation, and in the Southeast, where irrigation's on the rise.

Growing problem in many areas: Mismanagement of the supply on hand. In others, intergovernmental scuffling. Towns fighting "water wars." In some big cities, aging pipes that leak millions of gallons a day.

Adding to the anxiety: Lack of a comprehensive national water policy. One that improves conservation, helps to avert shortages and makes rules for irrigators and industry, who together account for 89% of consumption.

Water-shy states want such a policy, but the Reagan administration, to date at least, seems to favor throwing the issue back into their laps.

At the top of the danger list: All of New Mexico and Arizona, also the western reaches of South Dakota, Kansas, Oklahoma, Nebraska and Texas.

Large portions of California too -- Sacramento area and points south. Studies by Uncle Sam point to likelihood of major surface-water problems in 17 of 21 subregions by year 2000, including the states just mentioned.

As a nation we are using nearly 500 billion gallons of water daily. That's double the volume consumed back in 1950. Much of the increase is due to the advent of modern plumbing, swing to more showers, sprinklers. But the giant gulpers, farming and industry, have boosted usage the most.

Underground water? Crucial source of 50% of what our citizens drink. Take Florida as an example. U.S. report due out next fall will say city, industrial pumping have lowered its water table more than 150 feet and that over 900 hazardous waste sites and landfills are slowly polluting the underground reserves on which 92% of that state's population depends.

Irrigation? Another headache -- much economic, political fallout. Over 50 million acres are irrigated in the U.S., up 30% since 1969. Most of it in western states, but an increasing amount in the East. Many of the systems are old, inefficient and crying out for repair. Cost for that? $630 million a year, Soil Conservation Service says. Western farmers who irrigate vie with industry for water they need. Some say the competition could force more food production eastward.

200,000 wells puncture the High Plains alone, drawing off supplies from the Ogallala Aquifer, an 800-mile-long lake hidden under six states. Last December a joint industry-government report estimated that 23% of the Ogallala's contents will be gone by 2020 -- and sooner if droughts strike. Losses to New Mexico, Oklahoma, Texas would be severe, report stated. Would mean thinner herds, more dryland farms, higher prices for food.

Water purity is also an issue that bears watching in coming months. Environmentalists are fuming at the President, say he's shortchanging efforts that could help the U.S. sidestep future crises over water quality. Charges against Reagan? That he enfeebled three important water units, including the Council on Environmental Quality, the Water Resources Council and Office of Water Research & Technology. It's also claimed that Reagan played a reckless game by attempting to roll back antipollution standards. "Sellout to industry," critics charge. They want Uncle Sam as cop.

President Reagan's defenders? They say he's merely putting the issue where it should be -- at the doors of regional, state and local officials. They also point out he is now conceding that acid rain IS a problem. Here again, a sore subject with environmentalists who've long been arguing that airborne industrial pollutants kill lakes in the Northeast and Canada. Safe Drinking Water Act is of concern too. On the books since 1974, the law is being reviewed amid new demands for tougher antipollution regs. Curbs on lead and mercury levels, and on the leaching of hazardous wastes. Forecast? Congress will bypass the controversial issues until 1984.

As for the Environmental Protection Agency, its budget's been sliced. A drop of 24% since 1981, plus a personnel reduction of several thousand. However, the '84 budget -- en route to Reagan as we write -- is up again. On underground water, agency's new head told Congress the EPA has a role in protecting it, but main responsibility should remain with states. EPA's supposed to forge standards for industrial effluents in surface water, but so far has issued only a few proposed regulations, a situation that leaves industry shaken since it must comply with rules by July 1984. Forecast? Watch for Congress to extend the deadline on compliance.

Growers in the Midwest? They're on needles, not only over tomorrow's reserves of water but over its quality and the uneven distribution of it. Contamination heightens their concern -- herbicides, pesticides, salt and other potentially harmful substances that threaten underground pools. In Michigan, 649 polluted sites, contamination in almost all counties. In Wisconsin, septic-tank failures and leaky below-surface gas tanks. In Iowa, many wells improperly installed, some tainted by fertilizer.

Says who? Says Nat'l Conference of State Legislatures in report on underground water woes to be released this month at a meeting in Chicago.

Water-purity fears have sparked a boom in the sale of bottled H_2O:

Consumption's risen 278% since 1976 to annual sales of $700 million.
Californians drink half of the bottled water marketed in this country. Think of it. In 1982 alone they purchased more than 300 million gallons.
And we're not including seltzers or club sodas derived from tap water, only the distilled or mineral-spring waters so apparent in supermarkets.
Imported Perrier now has 75% of the business, U.S. labels under 10%. Field is attracting new entrants, including dairies and soft-drink houses.
Upshot? Much churning in the trade. So much that the sparkling-water bottlers have asked Food & Drug for standards covering all "mineral" types.

Note products that already show worry over water's safety or cost:
Carbon filtering devices...the price for them can range up to $175.
Reverse-osmosis filter...costs more but called worth it. $300 and up.
Water-stingy shower heads...dole out two gallons instead of 5 or more.
New filters, water softeners, even de-salting devices for home use.
And compressed-air showers, toilets that use only a quart of water.

Fact is, we're close to an explosion of new products and technology.
One large enough to shower riches on some investors and companies.
Trick? Knowing WHICH firms to pick in a line sure to become crowded. Among water-resource outfits now publicly traded: Culligan International, Ametek and WICOR. Some contend that WICOR has excellent profit potential for the long term. Still, good idea to check carefully into any firm that you hear discussed -- into its management, earnings record and prospects.

There are also investment possibilities outside the household market.
Analysts cite water cleanup as a field in which profits will be made because of concern about the effects of "tap" chemicals on human health.
They predict quickening sales for such things as pumps, meters, pipes, valves and comminutors, which are used to regulate solids in waste water.
Best overall profit growth? Traders talk up Goulds and Gorman-Rupp. Irrigation equipment? Valmont. Underground pumps: WICOR. Flow control: Gorman-Rupp and Gouids. Meters: Crane, Badger. Cement: Lone Star.

Cloud seeding to make rain? Catching on, but future's still hazy. Hard to control rainfall caused by scattering of silver iodide crystals.
What drops on your land may be a help, but if a downpour's widespread it could be a nuisance, or worse, for your neighbor, even bring a lawsuit.
One company in the rain-making field grossed $40,000 back in 1960. It now reports sales of $4 million, has nine projects currently under way.

Desalt more ocean water? Will happen, but expense is a deterrent.
Import surplus water from Canada? Unlikely scenario at this time.
Pipe fresh water from polar caps? Cost of doing it is prohibitive.
Tow icebergs from the Antarctic? The Rand Corporation studied this, concluded it would take a year to park a berg outside thirsty Los Angeles. The high cost has even frightened off a Saudi sheik who explored the idea.
Numerous books and reports deal with the water issue. A sampling: "Nor Any Drop to Drink" by environmental activist William Ashworth. His 272-page analysis of the subject is $6.95 in paperback, from Summit Books. "Water, the Next Great Resource Battle" handles the topic at swifter pace. By Laurence Pringle, Macmillan. $9.95 for hardback. 144 pages. Photos.

Some climatologists expect awful droughts to hit the United States. A dry period worse than that of '76-77 and possibly one of the worst ever.

When? Within the next 15 years, perhaps sooner. By their reckoning, key farming areas would be devastated and food-production systems upended.

They also warn that global weather patterns could change drastically over the decades just ahead. How? As a result of the greenhouse effect, an unusually severe heat-up caused by pollutants trapped high in the air.

Melting of glaciers would accelerate, seas would rise more rapidly. Meaning? A crazy quilt of floods and droughts. Weather chaos worldwide.

Ice-free shipping lanes would open near the poles, under one scenario.
Midwest temperature would jump, run about 10 degrees higher all year.
Lethal dryness would hit Iowa, Kansas. Canada would get a rain bonus.
Some weather experts even fix 2020 as a likely year of "superdrought."
Why 2020? About then both warming and reservoir depletion would mesh.

Granted, there's both theory and speculation in such scary forecasts. Yet that does not mean they can be dismissed out of hand. The American Association for the Advancement of Science is taking them seriously enough. Beginning in 1984 it will devote three years to the collection of facts on the link between climate and water supplies. First effort of its kind.

There's a bright side to the "disaster" coin. Mankind won't simply stand still and let the worst happen without trying to halt or soften it. Instead, the wheels of innovation will turn faster to head off catastrophe.

You'll see more crops that require little water for their cultivation.
You will also meet halophytes -- vegetables that grow in salt water.
Look too for closed-environment farming done in plastic greenhouses.
New underground barriers that halt the flow of reservoir pollutants.
Better water management by industry, farmers and local governments.
And use of bacteria that "eat" chemical poisons. Bio-reclamation.

The struggle over water raises many questions that will end up right here in Washington seeking answers from Presidents, Congress and the Court.

Who OWNS the water? Enough in that alone to occupy a lawyer's career. Curbs against interstate transfers of water are already under heavy fire.

Establish a U.S. Department of Water? Some expect one before long -- feel it makes as much sense as an Energy Department to handle oil crises.

Water as a decisive political issue? Will be one as early as 1985. That's what capital seers tell us. Say it's coming with '85 farm bill.

BOTTOM line? Your taxes will rise to pay for future water projects.

The cost of water is headed up too -- what you're charged as a user. Average American is billed $1 for 1,000 gallons. West Germans pay $2.80. As the U.S. price rises, inventive people will be challenged to develop methods and products that keep water not only affordable but safe to drink. Big challenge -- may prove to be the greatest one we've ever faced.

Sincerely yours,

Paul Trivoche

Editor, U.S. News Washington Letter

Vol. 9, No. 26
12:01 p.m. EDT

P.S. Richard E. Scott was the principal reporter for this week's letter.

Mr. Virgil Showerman
Collis - Div. Chamberlain Mfg.
2005 S. 19th
Clinton, Iowa 53732

Dear Mr Showerman:

Enclosed is our schematic of the proposed pollution control and water reduction of your plating lines. You will find a great use of timed sprays. In the cleaner sprays, deionized water will be used to reduce dissolved solids. All sprays will use 5 micron filters. Incidentally the sprays and pipes, furnished by us, will have unions to facilitate quick changes, should a spray clog.

Line - Hook up

1. Cleaners -: The soak and electro cleaners will have timed sprays (a deionized and timed spray to equal evaporation. Limit switches will start and stop a 3/4" solenoid valve supplied by us. You will install limit switches and spray lines. The rinses will also use a timed tap water spray although re-used water from the indexing filter will be used for the rinse. In the electro rinses there are two rinses so the first one will be a timed spray equal to evaporation. These tanks will be pumped to the electro on a "keep full" basis.

Acid - The acid rinses will be a running rinse from the indexing filter. A timed spray will act as a final rinse.

Zinc Plate - The first two tinses will be timed spray rinses from tap water. The overflow will be pumped to a cyanide destruct system. Tank # 18 will be a recycled deionized rinse.

Chromate- Tank #20 will have a timed spray rinse, this will go to drain. If the chromates are above regulations, we will use bisulphite to reduce the chrome, filter, heavy metal removal and to drain. Tanks # 22 and 25 will be recycled with deionized water. Tnak # 24 will use a timed spray. The overflow will go to the indexing filter for reuse.

Connections - A 2" pipe will carry the overflow from tanks #2, 5, 7, 8, 11, 13 & 14 back to a collection reservoir. From there it will be pumped to a treatment reservoir with a dry powder feed, a pH control, an acid feed and a mixer. It will then flow into the indexing filter for primary filtration. From there, it will be pumped to a 4 cartridge filter, a heavy metal remover and back to the rinse tanks. The excess will go directly to drain.

Piping back to the tanks will be 1½" pipe. Each "Tee" to the rinse tanks will have a Dole flow control and a valve. We will provide the 1½" pipe to the rinse tanks with the flow control and valve.

The recycled tanks will need no piping if we can place them within 5 feet of the rinse tank

We reiterate that we guarantee compliance with the pollution control regulations.

The system on a purchase basis would, per line ..... $ 51,500.00
This would include the final destruct system.

After 5 years, the cost of the system , on a service basis - monthly 3,000.00

The purchase price after 5 years, per line 5,000.00

I am available at any time for addtional discussion and explanation to any questions that you might have.

Very truly yours,

Thomas Allegretti

AMERICAN DEMINERALIZER CO
4425 W. Montrose Avenue
Chicago, Il 60641
312 545 6650

November 26, 1982

Mr. W. Tipton
Water Saver Faucet Co
701 W. Erie St
Chicago, Il 60610

Dear Mr. Tipton:

To comply with MSD rules, reduce water, chemical and cleaner consumption, we suggest the following:

Both Cleaners to be filtered.

Discussion - The cleaners need not be drained for at least a year. The spray rinses will be deionized. The make-up will be deionized.

Whatever water reaches the drain will be pumped to a pollution control sump, treated and sent directly to drain. You will supply a floor sump and electrical connections to our equipment.

Note: We guarantee compliance. We handle all MSD legal problems.

The cost of the installation ..... $ 5,000.00
Terms - with P.O. 2,000.00
Balance - 30 days after completion of the installation.

We propose that - #1 & 3 be rinsed in #2 - a timed spray rinse.
#6 rinse be pumped back to the #4 rinse.
#8 rinse is a timed drag-out rinse pumped back to #7 Cu solution.
#9 is recycled, nothing to drain from Cu.
#11 rinse is joined with the #6 rinse and pumped back to #4.
#13 is a drag-out timed spray rinse and is pumped back to #12.
#14 is recycled - nothing to drain from Ni.
#16 is a timed drag-out rinse and is pumped to # 15. The sprays must equal evapoartion and drag-out of tank #15.
#17 & 18 are the final rinses and are run @ 140°F. These are counterflowed. The floor sump will be dug out to allow pick up from the floor for treatment before being sent to drain. Total flow to drain - 3 gpm.

Your monthly service cost 575.00
This includes all maintenance of equipment, exchange of deionizers, filter cartridges etc.

All equipment remains the property of American Demineralizer Company.

We reiterate that we keep you in compliance with the MSD regulations.

Very truly yours,

American Demineralizer Co

4425 W. Montrose Ave
Chicago, Il 60641
(312) 545 5650

1/8/82

Handy Button Machine Company
1750 N. 25th Avenue
Melrose Park, Il 60160

Gentlemen:

To reuse the rinse water and prevent pollution, we suggest the following:

A. BRASS - ZINC LINE

Tank #2 - this will be recycled (a recycled rinse). The equipment required -
(a) one 1hp, 3 phase pump/filter assembly
(b) one 18x72 deionizer

Tank #4 - a reused water rinse. Equipment - (a) one 1 hp, 3 phase pump/filter assembly.
(b) one 18x72 deionizer.

Tank # 5 - this would have a 4 cartridge filter (8x28 cartridges) plus one 2 hp pump for recycling to keep the tank clean.

Tank #6 - one 4 cartridge filter, 2 hp pump again for recycling to keep tank clean.

Tank #7 - a drag out tank - timed sprays.

Tank # 8 - will use water from the final filtration system.

Tanks 11 & 12 - Tank # 12 will contain fresh water. It will be counterflowed into tank #7 and overflow to the collection reservoir.

Tank #19 - this will be counter flowed. The overflow will go to a collection reservoir and will be pumped to the cyanide destruct system. The cyanide destruct system will consist of 2 - 500 gallon tanks one above the other. A hypochlorite will be used to break down the cyanide. The overflow from the top tank will flow into the 2nd tank. It will be treated for reuse.

Tank #20 - will be recycled.

Tank # 25 - this will be a drag out tank.

Tank # 26 - this will be overflowed into the central collection system for reuse. The central collection system will contain a dry chemical feed for flocculation. Three 4 cartridge filters in parallel will be used for filtration with a 2 hp, 3 phase plastic pump. A heavy metal remover will be used to convert non-sodium salts to sodium salts. An overflow of excess water will go to the final treatment before being piped to drain.

Tanks # 28 & 29 - these are recycled.

American Demineralizer Company

B. NICKEL LINE

Tank #2 - this will be recycled using a plastic 1 hp, 3 phase pump/filter assembly. Deionizers will be used for ionic removal.

Tank #3 - one 4 cartridge (8x28) filter and 2 hp pump will be used for filtration.

Tank #4 - one 4 cartridge filter (8x28) and 2 hp pump will be used for filtration.

Tank #5 - this overflow will go to a central collection reservoir for re-use.

Tanks # 7, 8 & 9 - these tanks will be counterflowed. Tank #9 will have fresh water. The overflow from tank #7 will go to a central collection reservoir for re-use.

Tank # 14 - this overflow will be piped to the central destruct unit. Tank #14 will be sent to the nickel recovery unit for recycling and nickel pick up.

Tank # 15 - this tank will be counterflowed with tank # 14 when no black nickel is used. When black nickel is used it will go to the central reservoir for re-use.

The nickel recovery unit will consist of a 500 gallon plastic holding tank with a 3/4 hp plastic pump and filter. One 18x72 Carbon unit will be used for the nickel pick up. This unit will be regenerated on your premises for nickel recovery. Two 18x72 gallon tanks will be used for the acid radical pick up. One 2 hp pump/ filter assembly will be used for recirculation and one 100 gallon reservoir with one ½hp pump will be used for regeneration.

The central reservoir will have a dry chemical feed plus a 4 cartridge filter and HMR remover.

The final collution control system will use 3 sump pumps at different levels to prevent floodup. Water will be pumped to a 500 gallon reservoir by the sump pumps. One 1hp, 3 phase plastic pump and 4 cartridge filter will clarify the water before going to a HMR and before being piped to drain. A recording pH control will also be used for monitoring.

It is anticipated that the 3 lines will have 1. 200' - 2½" pipe plus fittings.
2. 350' - 2" pipe plus fittings.
3. 700' - 1½" pipe plus fittings.

The cost of the installation ..... $ 45,500.00
With purchase order - one half
Balance - 2 monthly payments - 30 & 60 days after start up.
Monthly service cost 2,500.00
This includes all maintenance, replacement of equipment etc as needed, deionizers HMR's exchanged and also the filter cartridges.

We are available to answer any questions that you might have.

Very truly yours,

Thomas Allegretti

• WATER MANAGEMENT ENGINEERS •

American Demineralizer Co.

4423 W. MONTROSE AVE. CHICAGO, ILLINOIS 60641
(312) — 545-6650

One-Year Payoff for Demineralizers

Chicago job plater installs units to cope with pollution, shipping spent resins back to the supplier . . .

A Chicago job plating shop has installed 11 deionizers to cope with pollution-control problems. According to Wayne E. Fell, president of Atlas Plating Works in Cicero, Ill., a Chicago-area city, the deionizers have not only removed contaminants from plating rinse water but have saved about 800 dollars monthly in water bills.

Engineered by American Demineralizer Co., Chicago, the system has reduced the use of water at Atlas by 80 pct and eliminated product spotting at the same time. Formerly, two full time employees were required to wipe the finished items as they came off the plating lines.

WAYNE E. FELL (left), president, Atlas Plating Works, Inc., Cicero, Ill., shows Laddie Coller, plant manager, how pure the water is after it is treated for recycling in the concern's new demineralizer system. One of the 11 deionization units can be seen at left

A pioneer in the electroplating of plastics, the 58-year-old Cicero concern has three plating lines. Two are for plastics, one for steel. Because of a recent surge of business, an additional line is now contemplated.

The 11 deionizers serving the plating lines at the rinse points remove chemicals, metals and other contaminants from the water before the water is recycled. To save additional water, it has been decided to install three more units.

The system will pay for itself in about a year in water savings alone, states Mr. Fell. The other economies are also significant, especially the elimination of spotting.

Deionization cylinders are replaced with fresh units at two- to four-week intervals. The spent units are trucked to American Demineralizer, where nickel, copper, chromium and zinc are recovered by regeneration techniques.

"Although plating is a relatively small part of the total picture in the metals industry," said Mr. Fell, "it has been the target for some of the most highly restrictive pollution controls. Chicago platers have had a serious problem trying to conform with the ten-parts-per-million pollution limit imposed by the code of the Chicago Sanitary District.

"Fortunately, our new demineralizing equipment solves the problem for us." PF

Sentra-Met Inc
118 S. Main St
Summitville, Ind 46070

Attention: Mr. John See

Dear Mr See:

Per our telephone conversation I would suggest the following:

I. CLEANERS (Filters)

(a) Both the soak and the electro cleaner are filtered @ 5000 gph. We use our 5 micron, special paper cartridge which absorbs the oil and removes the dirt.

For make-up and to prevent dissolved solid build up we use deionized water for the timed sprays. These are usually 5s econd sprays and the total volume must not exceed the evaporation and drag-out. By filtering, the cleaners should last indefinitely. By using the sprays we wash the cleaner back into thetank to save it and, also, increase life for our recycled deionizers.

(b) Rinsing - The cleaner rinse is recycled and nothing goes to drain.

2. ACID (acid solution)

(a) The acid tank will have a 5 second tap water, pressurized mist to wash as much of the acid as possible back into the acid tank. This is done to reduce the load on the deionator.

(b) Acid Rinse - the rinse is joined with the cleaner rinse at the collection sump. It is then pumped through the filter and the deionizer and back into both rinse tanks @ 20 gpm. No water goes to drain.

3. NICKEL (nickel solutions)

(a) Each nickel tank will have a timed spray equal to the drag out. These 5 second deionized water sprays will wash almost 100% of the drag out nickel back into the nickel tank thus increasing the life of the deionator.

(b) Nickel Rinses - we will use to recycled, counterflowed rinses. There will be no drag out rinse as the sprays are used in place of a drag out. Nothing goes to drain.

4. Chrome (Hot Chrome Tank Rinse)

(a) The chrome tank rinse will also have a timed spray equal to drag out. Since chromic acid is more viscous than the nickel solution, our rinse efficiency with the sprays will be about 95%. Nevertheless the sprays enable us to recycle the next tank @ 20 gpm very economically.

5. FLOOR & ACID

(a) an 18" sump in the floor with a 1/3 hp sump pump will pump the floor water to a 200 gallon plastic tank. This tank would also be used to remove the heavy metals from the acid after it is pumped to this tank and the pH adjusted to 5.5. The water in this 200 gallon reservoir will be pumped through a filter and heavy metal remover and sent to drain. This should not exceed a couple of hundred gallons per day with a heavy metal content of 0.5 ppm.

6. COST

(a) the cost of the above equipment ..... $ 21,500.00
this includes the supervision of the installation which should take only a few hours as most of the equipment is pre-fabricated.

(b) Terms - with purchase order (one half) or 10,750.00
balance - 6 equal payments of 1,796.00
beginning 30 days after installation

Upon receipt of final payment the filter assemblies become your property. The deionizers and heavy metal removers remain the property of American Demineralizer Company.

DISCUSSION

There will be 2 sets of deionizers, when the first set is exhausted you will notify us and we will prepare another set. Your truck will deliver the exhausted units to our plant and exchange them for regenerated units.
The cost per unit - exchanged..... 200.00
each set should last about 4 - 8 weeks.
The filter cartridges must be exchanged at the very most, every 60 days.
The cost per filter cartridge (7"x24" or 7"x25") each, lots of 6 ..... 22.00
The cleaner filters should be changed every 60 days, at the most.
The cost per cleaner cartridge..... 35.00
The latter cartridge can be cleaned once or twice for re-use.

Please feel free to call me for any further discussion.

Very truly yours,

Thomas Allegretti

TA:ma

February 25, 1983

M S L
Connell St & Moen Avenue
Rockdale, Il 60433

Attention: Mr. William Cook

Gentlemen:

After my recent visit to your plant I would like to make the following suggestions:

Phosphate Line

1. Most of the water in the phosphate line should be reused.

2. Both cleaners should be filtered @ 5000 gph.

3. That the first rinse be a drag out rinse with a timed spray over the barrel as it turns. The deionized spray will equal the evaporation of the cleaner tanks. A small sump pump will pump the liquid back to the cleaner tanks on a keep full basis.

4. The 2nd cleaner rinse will be recycled and deionized.

5. The acid tank will have a tap water rinse as now.

6. The 1st phosphate rinse will be a drag-out similar to the 1st cleaner rinse. The liquid is automatically pumped back to the phosphate tanks.

7. The last rinse will be recycled.

Note: The only water to drain will be the acid rinse tank. Since there are no pollutants here it will be pH controlled and sent directly to drain. When the cleaner tanks are dumped the cleaner should be saved for neutralizing the acid rinse.

Cost - The cost of the system ..... $ 8,150.00
terms - with purchase order - ½ or 4,075.00
balance - 2 installments (30 & 60 days after start up)
Monthly service cost 700.00

Service cost includes the exchange of deionizers every three weeks and the cartridges will be exchanged at the same time, four cartridges for each cleaner and one cartridge for each filter before the deionizers. We also provide a reserve set of deionizers and cartridges, this prevents any shut down.

AMERICAN DEMINERALIZER CO.

MSL

Service (cont'd)

You will deliver the exhausted deionizers to our plant and pick up the new sets.

We will replace any defective or worn out equipment at no further cost.

The flow rates for the recycling will be 20 gpm for each rinse tank.

All equipment,except the cleaner filters, remains the property of the American Demineralizer Company.

Delivery time is from 2 - 4 weeks.

Burnishing Line

We suggest recycling the burnishing line using the following equipment, this equipment will remain your property and we will replace any parts that break down within one year.

Equipment - (1) one sump pump to pump water from the present pit to the indexing filter.
(2) one 30 gpm indexing filter (10' long x 4' wide x 3' high).
(3) dry powder feed.
(4) one sump pump to pump water from the indexing filter to the water reservoir
(5) 300 gallon tank for reservoir (this is provided by your company).
(6) one 4 cartridge polishing filter.
(7) one 1½hp centrifugal pump.

Discussion - Water from the burnishing drums and the tumblers will go to the reservoir in the pit. From there it will be pumped to the filter. From the indexing filter it will be pumped to the 300 gallon reservoir. The 1½hp pump will pump the water through the system. The pit will act as a reservoir. We suggest an air line at the bottom of the pit to agitate the precipitate when the sump pump goes on.

We further recommend a 1½" pipe from the centrifugal pump to the 3/4" manifolds for the tumblers. A 1½" line should be used to fill the burnishing machines.

The flow rate will be @ 30 gpm. We suggest emptying the system every two weeks to keep the water fresh. A bacteriacide should be added to the water

The cost of this system ..... $ 9,450.00
Terms - with purchase order ..... one third
balance - 30 & 60 days after start up.
Filter media costs including the polishing cartridges are hard to estimate.
One set of cartridges should last 30 days @ an exchange cost of 80.00
Indexing filter media, approximately, per month 120.00

I will be in touch with you to discuss any questions you might have.

Very truly yours,

Thomas Allegretti

February 9, 1983

Mr. Don Knapp
Plant Manager
Sloan Valve Company
10500 Seymour Avenue
Franklin Park, Il 60131

Dear Mr. Knapp:

We are in receipt of Mr. Callier's letter indicating the following costs in your plating process:

Nickel salts	$ 30,132.21
Cleaners & Brighteners....	26,122.00
Water use cost	22,719.00
Trans & Hopper rental..	5,424.00
Total	84,397.21

Had our system been in place in 1982 your costs would have been as follows:

Nickel salts (will recover 95%)...	$ 1507.00
Cleaners & Brighteners (will recover 80%) ..	$ 3224.00
** since they are filtered & deionized they will remain in like new condition.	
non recoverable material.....	1968.00
Water usage (reduced 95%).....	1136.00
Transportation & Hopper rental	none
Total	9835.00

The savings, therefore, for the year would have been	$ 74,562.00
However, there is a one time charge - installation..	18,450.00
Monthly service cost x 1960.00	23,520.00

Your first year's saving would have been $ 32,500.00 and subsequent years over $ 50,000.00

In addition to the above savings there would have been a reduction in energy to evaporate the chrome rinse as well as a reduction in chemicals for precipitating the sludge. Further there would have been no labor for handling the same.

Sloan Valve Co

The installation cost of $ 18,450.00 would be payable - one third with P.O.
One third - in 30 and 60 days after start up.

The monthly service charge includes all maintenance, equipment replacement and changes of deionizers etc.

EQUIPMENT SUPPLIED -

A. Soak Cleaner - (a) timed deionized sprays with solenoid & filters
(b) Recycling - 1 hp, 3 phase plastic filter/pump assembly with 20 gpm deionizer.

B. Electro Cleaner - (a) timed deionized sprays with solenoid & filter
(b) Recycling - 1 hp, 3 phase plastic pump/filter assembly and a 20 gpm deionizer.

C. Acid - (a) 1 - 3gpm spray over full tank.
(b) ½hp single phase pump/filter assembly
(c) Heavy metal remover for effluent to drain.

D. Nickel Line - (a) timed sprays on the first rinse. The liquid is pumped back to the nickel tank. The sprays must equal the drag out and evaporation of the nickel tank. The sprays usually rinse off 95% of the copper.
(b) high purity deionized water rinse @ 20 gpm, 1 hp, 3 phase filter/pump assembly.
2 - 6 cu. ft deionators.

E Chrome - (a) timed sprays over the rinse tank. These should be approximately 1 gpm to reduce evaporation costs.
(b) 150° F recycling system for final rinse - 1hp 3 phase, plastic filter/pump assembly.
1 - 6cu. ft deionizer

DISCUSSION - all rinses except the acid rinse are deionized.
flow rates - 20 gpm as a by pass system.
each recycling system is separate thus eliminating down time.
one can always go back to a raw water rinse.
final pollution control at drain guarantees no pollution.
cleaners are filtered @ 60 gpm to maintain cleanliness.
cleaners are made up with deionized water.
we suggest you start with 50% of normal amount of cleaner compound and add until adequate cleaning power is reached.
as a result of the deionized spray only deionized water is added.
deionized sprays reduce dissolved solid build up.
cleaners last indefinitely.
nickel solution is washed back into the first rinse with deionized water equal to the evaporation of the nickel solution so that about 95% of the drag out nickel is saved.

Sloan Valve Co.

DISCUSSION - energy costs are reduced by using a timed spray rinse for the chrome rinse.
the following chrome rinses are recycled @ 140° - spot free rinses result.
since the only water going to drain is from the acid rinse - the heavy metal is removed at the drain.
your flow will be from 1 - 2 gpm making pollution control simple and expedient.

Should you decide to accept our system, we would apply the same to your brite dip and strip line.

In the case of the brite dip, the first rinse would be plated out to recover the metals which would be added to your foundry metal.

As to the strippers, this metal would be plated out and sold.

In both applications the following rinses would be recycled. The flow to drain, in each instance, should be less than 100 gph and would be run through a heavy metal remover.

We would like to test plating out the strip and brite dip solution to give them longer life and pick up more metal. Since we do this with HCl at our plant we would have to experiment to test the efficiency of our "plating out" system. This would be done, of course, at no cost.

We would appreciate a further meeting and discussion so that we may answer any questions you may have.

Thank you for your courtesy and time.

Very truly yours,

Thomas Allegretti

June 27, 1983

Mr Dean Homan
Maintenance Supervisor
Callen Mfg., C rp
13 E. Lake St
Northlake, il 60164

Dear Mr Homan:

To comply with future EPA rules in regard to zero to drain, we suggest the following:

I. Recyled filtration for the vibrators:

(a) an indexing filter with flow rate of 20 gpm.
(b) a dry powder flock to aif in filtration.
(c) collection reservoirs and pumps.

II. Die Cast Release:

(a) The collected water from the die release would be used in the vibrator system.

III. The cost - of the above system ..... $ 5,000.00

IV. Cooling Towers

The evaporation from the two towers would be approximately 13 gpm. By using deionized water, there would be no water to drain. Further, chemical costs should be reduced 85%.

(1) deionizing system would consist of - (a) 20 cu. ft of cations - 24"x96" lined tank
(b) 15 cu. ft of anions - 24"x84" lined tank.
(c) 1½" piping
(d) semi-automatic with manual valves; automatic regenerated rinse; 130,000 gal. capacity.

V. Cost - deionizing system..... $ 12,000.00

VI. Terms - with P O. 50%
balance ..... 60 days after installation.

Discussion

With the aforementioned system - approximately 1800 gallons of regenerating and rinse water would go to drain every 10 days..

The water would be completely free of pollution and would contain only calcium and sodium salts of carbonates, chlorides and sulphates.

Because this system is being offered on a per cost basis we must request the 50% payment with purchase order. We can extend the balance terms to a 60 day period after completion.

I will be happy to answer any questions that might occur. I look forward to hearing from you.

Very truly yours,

Thomas Allegretti

Mr. Roe. Please proceed.

TESTIMONY OF THOMAS ALLEGRETTI, AMERICAN DEMINERALIZER CO.

Mr. ALLEGRETTI. Mr. Chairman and gentlemen, I would like to make the U.S. News Washington Letter as part of your record. It is one of the best things I have seen on water.

What I am going to say to you is at odds with some of the things we have been hearing but I must admit that I have never been through a chemical plant. When I called them, they had no problems.

Now basically there are three problems facing the Government pertaining to the elimination of pollution.

First, is that it is a pollution problem itself and the prevention of further contamination of lakes, wells and streams and the reduction of the sanitary system loads.

The second is water conservation itself, although water is never eliminated by usage, the sources of water may be eliminated by a lowering of water tables and a reduction of supplies from reservoirs, lakes and streams.

Then the third problem is a reduction of haulaway, reducing of landfills.

As to the elimination of these problems the answers, obviously, are to reuse water, never let it leave the plant and prevent its contamination so that it can be reused.

Again, if the cost is too high, reuse and decontamination would not be the solution, We, at Amdec—American Demineralization Co.—sell a service wherein we supply equipment to reduce pollution to zero and decontaminate water so that it can be reused indefinitely. We also do this at such a savings that repayment is

within a 6-month period. We also save on chemicals to further decrease reuse cost. Since we keep our pH at about 6 we reduce sludge to that which is entrapped by our filter cartridges, thus eliminating landfills.

May I cite some examples:

I had written big three auto manufacturers concerning the difficulty of compliance with the regulations. Chrysler permitted me to visit their plant in Belvedere, Ill. At Belvedere, approximately 1,000 gpm of well water is used. The plant to process this water to drain cost $7 million. Using interest, depreciation and operating costs, I have estimated the annual costs to be approximately $2 million. By using a system such as ours we can provide them with a higher purity rinse water and at 2,000 gpm. Further, we can filter their cleaners, phosphate, and chromate solutions at 300,000 gph.

Presently they dump their cleaner every other day but by properly developing a cleaner, the cleaner should last many months. In this type of system no water would go to drain and Chrysler would have the use of unlimited high purity water. Water is used in their painting section and this can be treated so that it too can be used indefinitely or sent to drain monthly. This decontamination should be simple. The cost of such a system would be less than $300,000 per year.

In plating plants we cut water consumption by 98 percent and seldom less than 95 percent. In addition we save their cleaners, their nicel salts, the copper salts, most of the chromate solutions and still give them a spot-free rinse. We do not sell them on pollution control but we sell them on saving money. Their payback is usually from 4 to 6 months.

While in California I visited Silicon Valley. Most of the plants in the computer field could easily reduce water consumption 99 percent and have better rinses.

I also visted a tomato cannery, here 250,000 gpd were used. The BOD to drain was extremely high. Both the water to drain and the BOD could be reduced 98 percent and pay back within 6 months. It must be remembered, in most instances, the problem is not water supply but BOD to drain and this is a great problem.

The sanitary district could not handle any more BOD nor water. East of the mountains in the desert, plants could use 2, million gpd and not even go to drain. Homes, by judicious use of water, could be built in the $30,000 to $40,000 range.

The problem again is twofold, Congress does not know what to do and any two votes will change its mind. In 12 years we have accomplished almost nothing and yet spent untold millions. Since Congress will not grapple with the question, industry as a whole does nothing.

As to enforcement, use the IRS methods. The head of the company must submit a bimonthly affidavit as to the composition of his effluent. Periodic checks should keep him honest, if he is not, a few indictments would be a simple means of compliance enforcement.

Some years ago I read a Government report listing New Orelans as having the highest incidence of cancer. The drinking water comes from the Mississippi. The next highest was Aurora, Ill. Its wells were contamined by the Fox River.

The health of this Nation is in your hands. The previous statement seems trite as you have had many others appear before you who have reiterated such a statement. There are solutions available and good solutions.

As yet I have not heard from Chrysler or General Motors, et cetra and I do not expect to—what is a few million dollars? Top executives are not noted for worrying about the health of the country unless it has a profit attached thereto. Should the price of their water rise some 300 or 400 percent, economy might then sink in.

Let me summarize and suggest:

First, raise the price of industrial water;

Second, charge industrial well users for water taken from wells.

Third, pass a law making plant managers responsible for an affidavit of contents for water going to drain;

Fourth, allow or continue a tax reduction for pollution control equipment;

Fifth, do not spend more money for sanitary districts. If industries reuse water, they would have more capacity at less cost than they can use;

Six, advertise your laws, enforce them, there has been little enforcement in the last 10 years;

Seventh, do not listen to cry babies.

Most important of all, do not allow a dilution, parts per million. Set up a weight. I do not think any pollution should go to drain. We do not know what the next thing that will be to cause cancer, we are developing new chemicals. Let the companies handle this in their plants. They could save money doing this and they have their problems. They know what to do.

Now, if you have any questions I would be happy to answer them.

Mr. ROE. We want to thank you very much for your testimony, Mr. Allegretti.

Do you have any questions, the gentleman from Minnesota?

Mr. STANGELAND. I have no questions.

Mr. ROE. No questions. We thank you very much for your testimony.

The subcommittee will recess until Wednesday next at 10 o'clock.

[Whereupon, at 12:47 p.m., the subcommittee recessed to reconvene at 10 a.m., on Wednesday, November 9, 1983.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

WEDNESDAY, NOVEMBER 9, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to notice, at 10:20 a.m., in room 2226, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. The subcommittee will come to order.

We are on a continuation of hearings on the clean water bill.

We want to welcome you all here. Our first panel of witnesses will be the National Wildlife Federation, represented by Mr. Robert Davison; the Environmental Defense Fund, represented by Dr. William Brown, senior scientist and attorney; and the International Association of Fish and Wildlife Agencies, represented by Mr. Wes Hayden.

Will you all come forward and take your place at the table? We will begin.

Is this the National Wildlife testimony? You are going to summarize it, of course.

We want to welcome this very distinguished panel. As you know, we have 2 more days, today and tomorrow, of this week, for testimony. Then we are going to try to conclude next week.

We had some environmental testimony earlier, but we were interested for the environmental organizations to come back again with more refinement, which is the purpose of your being here today.

Having said that, we would like to hear first from Mr. Robert Davison.

The full text of your prepared statements will appear in the record at this point.

[Statements referred to follow:]

NATIONAL WILDLIFE FEDERATION
1412 Sixteenth Street, N.W., Washington, D.C. 20036 202—797-6800

STATEMENT OF THE
NATIONAL WILDLIFE FEDERATION
BEFORE THE
SUBCOMMITTEE ON WATER RESOURCES
OF THE
HOUSE PUBLIC WORKS AND
TRANSPORTATION COMMITTEE
ON
SECTION 404 OF THE
CLEAN WATER ACT
AND
H.R. 3282

November 9, 1983

Submitted by:

Robert P. Davison, Ph.D.
Fisheries and Wildlife Division
National Wildlife Federation

Mr. Chairman and Members of the Subcommittee on Water Resources, I am Dr. Robert P. Davison, Legislative Representative for the National Wildlife Federation's (NWF) Fisheries and Wildlife Division.

NWF is the world's largest private conservation and education organization dedicated to the wise use of this nation's natural resources, especially its waters and wetlands. At our March 1983 Annual Meeting, NWF adopted a resolution calling on Congress to enact legislation that reverses the administrative dismantling of the Section 404 program. That resolution is attached as Appendix I.

I appreciate the opportunity to appear before this Subcommittee and to express our interest in the protection of the nation's rapidly vanishing wetlands. I am here today on behalf of our more than 4 million members and supporters and our 51 affiliated statewide and territorial organizations to voice our support for the Section 404 program and to urge this Subcommittee to adopt the amendments to Section 404 proposed in H.R. 3282, the Water Quality Renewal Act of 1983, introduced by Chairman James Howard.

WETLANDS PROTECTION IS ESSENTIAL TO ACHIEVE THE GOALS OF THE CLEAN WATER ACT

Wetlands contribute significantly to the physical, chemical, and biological integrity of this nation's waters.

Wetlands buffer the effects of high storm run-offs and lower peak flood levels. A study of Wisconsin watersheds concluded that the flood water levels are 80 percent lower in

20-955 O—84——128

basins containing a mixture of lakes and wetlands than in basins with no such areas. Coastal wetlands and those along large lakes can be very effective at dissipating the energy from the wave action created by storms.

Groundwater recharge is an important function of some wetlands. Wetlands in the Pine Barrens of New Jersey have been identified as an important water source that recharges a large underground aquifer.

Water quality maintenance and purification of polluted water are valuable functions of most wetlands. Wetlands are now being used as biological filters to remove nutrients, such as phosphorus and nitrogen, from the effluent of sewage treatment plants. Hundreds of communities in the U.S. are benefiting economically from this practice. The value of this function extends beyond simple waste assimilation to the potential for removal of heavy metals, some toxic chemicals, and other waste products.

The biological integrity of our waters is dependent on wetlands. The plants and associated nutrients in wetlands form the basis of many of our most important food chains. Sixty to 70 percent of the 10 to 12 million ducks produced annually in the lower 48 states of the U.S. breed in the wetlands of the prairie pothole states of Montana, North and South Dakota, Minnesota, and Nebraska. In 1980, 62.7 percent of the 6.7 billion pounds of commercial fish caught by American fishermen was dependent on estuarine areas and their associated wetlands.

SECTION 404 IS AN IMPORTANT COMPONENT IN THIS NATION'S EFFORTS TO PROTECT WETLANDS AND WATER QUALITY

Because this nation's waters are ecologically and hydrologically interrelated, the destruction or degradation of our wetlands will adversely affect the chemical, physical, and biological integrity of all our waters.

Section 404 of the Clean Water protects wetlands by regulating the disposal of dredged or fill material in waters of the U.S. and, therefore, plays an essential role in meeting the goals of the Act: the restoration and maintenance of this nation's waters.

Section 404 does not prohibit development. Instead it allows the merits of proposed wetlands alterations to be reviewed and allows the U.S. Army Corps of Engineers (Corps) to require alternatives or mitigation to minimize damage to the aquatic environment.

Section 404 is credited with reducing wetlands loss due to filling and other regulated activities by about one-half (IWR Report, p. 103). In view of the considerable value of wetlands, as discussed above, Section 404 has substantially benefited the Nation. The Corps Institute for Water Resources (IWR) recently concluded that while there are costs associated with processing Section 404 permits, the reduction in wetlands losses attributable to Section 404 is an important reason why the permit program provides net benefits to the nation:

> "The current baseline operations of the Corps of Engineers regulatory functions program results in a net positive benefit to the Nation ... Most of the regulatory program benefits accrue due to avoiding costly water quality contamination and safety risks, and excessive wetland loss." (Emphasis added.) (IWR Report, pp. 89-93.)

Section 404 also has benefited developers. Project modifications developed during the processing of permit applications have reduced construction costs for 30 to 50 percent of the proposed projects and resulted in a 15 percent savings in total projects costs. In 1980 these savings were estimated to be as high as $271 million (Appendix II).

CERTAIN ADMINISTRATIVE AND REGULATORY REVISIONS AND PROPOSED REVISIONS TO SECTION 404 DIMINISH PROTECTION OF WETLANDS AND WATER QUALITY

Over the past year and a half, the Department of the Army (DOA) has substantially revised the Section 404 program and further changes have been proposed (48 Fed. Reg. 21466-21476). A number of these revisions and proposed revisions particularly concern us because they seriously weaken the ability of Section 404 to protect this Nation's waters, especially its wetlands.

On May 7, 1982, the Presidential Task Force on Regulatory Relief announced administrative reforms to the Section 404 program which significantly reduce the ability of the Environmental Protection Agency (EPA), U.S. Fish and Wildlife Service (FWS), and National Marine Fisheries Service (NMFS) to review projects and recommend mitigation and project modifications. These reforms include:

1. Vesting the Assistant Secretary of the Army for Civil Works (ASA-CW) with the authority to veto requests by EPA, FWS, or NMFS for referral of objectional permit applications to a higher level of authority in DOA for review;

2. Eliminating the opportunity for Corps Divisions to review permit decisions.

3. Limiting the issues upon which further permit review can be requested to exclude many cases where discharge activities have serious adverse impacts on aquatic resources.

4. Reducing the public comment period on permit applications; and

5. Greatly reducing the time available to EPA, FWS, and NMFS to review, comment on and object to controversial permit applications.

These revisions have been implemented through new Memoranda of Agreement and Corps regulatory guidance memoranda.

On July 22, 1982, Corps issued revised Section 404 permit program regulations. While these new rules contain many changes, two of these changes merit particular attention. They are:

1. The expanded nationwide permit program (33 C.F.R. Part 33) that diminishes the protection afforded this nation's waters and wetlands; and

2. The restrictions placed on the authority of the District Engineer to require mitigation.

Finally on May 12, 1983, Corps issued proposed rules that would further amend the 404 permit process to reduce uncertainty and delay. But rather than reducing an alleged regulatory burden, many of the changes proposed will weaken the wetland protection features of the Section 404 program and severely undercut public participation. In particular, the proposed rules would:

1. Through the issuance of 2 additional nationwide permits, exempt federally undertaken, funded or authorized discharges--e.g. dams, highways, channelization projects--and certain private discharges from the individual permit regulations of Section 404.
2. Define terms within the definition of wetlands so that approximately two thirds of the wetlands in the coterminous states would be excluded.
3. Strip the states of their ultimate authority to prevent the issuance of general permits that adversely affect the quality of waters within the state or that are inconsistent with state coastal zone management plans.
4. Discard the requirement that the opinions of state and federal natural resource agencies be given "great weight" in permit decisions.

The Administration states that the above administrative and regulatory changes will greatly streamline the Section 404 program without sacrificing environmental protection. We disagree. These changes have little to do with delay. Instead

they have greatly diminished Section 404's ability to protect our water resources.

And we are not alone in our opposition to Army's May 12 proposal. Thirty-nine agencies in 33 states and EPA submitted comments to the Corps that took strong exception to much of Army's "regulatory reform" effort. A sampling of those comments on the six most egregious Army proposals is attached (Appendix III).

CLAIMS THAT SECTION 404 AND CORPS REGULATIONS PROHIBIT DEVELOPMENT OR CAUSE EXCESSIVE DELAY AND COSTS ARE GREATLY OVERSTATED.

1. Of the approximately 76,400 Section 10 and 404 permit applications filed from 1977 through 1980, only 969--less than 1.3 percent--were denied (Appendix IV). Thus, permit denials are not stopping development. Permit denial, however, is essential to protect valuable wetlands and water resources from unwise projects. For example, the Corps refused to issue a Section 404 permit for the Davis Power Project that would have flooded the Canaan Valley in West Virginia. Canaan Valley, designated a "national landmark" in 1975, contains more than 40 percent of the state's wetlands and is the largest remaining shrub swamp on the East Coast.

2. From 1977 through 1981, 70 percent of the permit applications submitted to the Corps took, on the average, less than 75 days to process. (Section 404 requires decisions to the "maximum extent practicable" within 105 days--15 days for issuance of a public notice and an additional 90 days for public and interagency review and comment.)

3. During that same period, the average processing time for all permit applications, except those requiring preparation of an EIS, was 131 days.

4. Only 47 EIS's were prepared for permits in FY 1978, 1979, and 1980--or less than one EIS for every 1,000 permit applications. On average, the 47 actions took 815 days but these processing time were necessary for compliance with NEPA.

We do not claim that isolated examples of unwarranted delay cannot be found. But such examples, as the above information demonstrates, are not representative of the program as a whole.

Furthermore, lengthy processing times are frequently warranted. EPA, FWS or NMFS express their concern on approximately 30% of the permit applications they review because the contemplated project will have a serious impact on the nation's water resources. In these controversial situations, longer processing times (on average, 256 days) are typical. But the major resource savings of the program are realized through mitigation measures and project modifications recommended by EPA, FWS or NMFS. And the benefits attributable to these savings, particularly wetland conservation, outweigh the costs of extra processing time. (IWR Report, pp. 89-93.)

THE PREVIOUS INTERAGENCY REVIEW PROCESS DID NOT CAUSE UNNECESSARY DELAY: INSTEAD IT SAVED VALUABLE RESOURCES

Under the Memoranda of Agreement (MOA) that were in effect between March, 1980 and July, 1982, each of the federal

resource agencies had the authority to require additional review of a permit decision when it disagreed with a Corps District decision in a 404 permit. Agencies had the authority to elevate permits through as many as four levels of the Corps' hierarchy depending on the relative importance of the resource issues. Permits involving an EIS (Class I) could be elevated through four levels of review: the Division Engineer, the Chief of Engineers, the Assistant Secretary of the Army for Civil Works (ASA-CW), and finally, the Secretary of the Army. Permit decisions with the potential of making precedent setting policy or with substantial environmental impacts (Class II) could be reviewed by up to three levels, stopping with the ASA-CW. All other permits (Class III) could be referred only the the Division Engineers and Chief of Engineers.

The Administration faults this interagency review process under Section 404(q) for causing delay. The reviewing agencies were accused of taking too long to review and comment on permit applications and of abusing their authority to refer permits up the Army chain of command. Those claims are unfounded.

The review agencies complied remarkably well with the time constraints of Section 404. For example, the Southeast Region of National Marine Fisheries Service (NMFS) completed review of

97% of its permit applications within 30 days[1/] The Fish and Wildlife Service (FWS), between July 1 and December 31, 1980, averaged 22.5 days in reviewing 6,442 permit applications.[2/] And, between October 1, 1979 and March 31, 1980, the Environmental Protection Agency (EPA) reviewed 13,824 permit applications in an average of 24.9 days.[3/]

Moreover, the review agencies are not abusing their authority to elevate permit decisions. Very few permits were ever elevated, and of those that were, virtually all were reconciled at the Division Level:

Year	Total Permits	Referrals to the Division Level	Percent
1977	16,500	65	0.39
1978	16,405	45	0.27
1979	16,015	43	0.27
1980	14,267	45	0.32

1/Statistics on the Importance of NMFS' Habitat Protection Program Involvement in the Crops of Engineers' Section 404 Regulatory Program under the Clean Water Act and Habitats of Importance to Living Marine Resources, NMFS, Habitat Protection Branch, 1982, "NMFS Report."

2/Draft Fish and Wildlife Service Section 10/404 Permit Program Summary of Major Statistics July 1-December 31, 1980, "FWS Summary."

3/Section 404 Permit Program: Final Results of Regional Office Questionnair, U.S. Environmental Protection Agency Office of Federal Activities (A-104) 404 Program Branch, "EPA Report."

Of the 18,000 permit applictions NMFS reviewed in 1980 and 1981, it requested elevation on only 17. Three of these were elevated to Washington.[4/] From 1974 to 1980 NMFS reviewed 87,307 permit applications and only elevated 20 to Washington. Of the 6,442 permit applications FWS reviewed from July 1 to December 31, 1980, only 11 were elevated. In 1980, EPA elevated only 11 permits, 5 of which went to Washington.

Furthermore, the reviewing agencies have shown a strong willingness to further improve the efficiency of the interagency review process. For example, at the encouragement of NMFS, FWS, and EPA, the Norfolk District of the Corps has implemented joint processing of applications. Each month, all the involved agencies meet in Norfolk and review pending applications. Federal agency coordination is completed for 90-95 percent of these during the monthly meeting. The joint processing meetings have reduced by 50 percent the amount of time necessary for permit processing on non-controversial permits and 20 to 30% for controversial permits.[5/]

SECRETARIAL VETO OF PERMIT REFERRALS IS UNWISE

We believe the Administration erred by vesting veto authority in the ASA-CW over permit referral requests.

4/Memorandum from H. Stephen Halloway, Associate General Counsel, Dept. Commerce to William Gianelli; Nov. 16, 1981.

5/The Coordinator, Regulatory Functions Information Exchange Bulletin, U.S. Army Institute for Water Resources, July 1978.)

Interagency review of permit applications is essential to the wise use and allocation of our resources. We believe that such review is the primary reason Section 404 reduces by one-half the wetlands lost each year from disposal of dredged or fill material. Congress intended that agencies with expertise review permit applications so that natural resources receive equal consideration with the economic purposes of a project. The extensive review given a permit upon referral frequently results in resource savings. For example, between 1978 and 1980, NMFS recommendations saved approximately 16,000 acres per year in the Southeast Region alone. The ASA-CW veto has thwarted Congress' intent and crippled the review process.

Since July, 1982, under the new MOA, FWS has elevated 20 permits to the ASA-CW for actions that would destroy between 6,428 and 6,664 acres of wetlands, predominantly bottomland hardwood swamps in the Lower Mississippi River Valley. Of the permits pending on bottomland hardwood conversion, Assistant Interior Secretary G. Ray Arnett wrote ASA-CW William Giannelli (December 10, 1982):

> The Bottomland Hardwoods in this country decreased from 229,000 acres in 1957 to 119,000 acres in 1977. It is only reasonable to assume that less than 100,000 acres remain today. That is all that remains of some of the best Bottomland Hardwood acreage in the country. The decision to issue all five of these permits rests totally with the Corps, thus even by your definition of cumulative effects these areas qualify for consideration. This, therefore, is your opportunity to save a large and significant tract of an extremely important, but diminishing national resources--and I urge you to do so.

Assistant Secretary Giannelli elected not to save these resources and issued all five permits without modification. In fact, of the 15 elevated permits, five requests by FWS for further review were rejected outright by the ASA-CW. Six permits were reviewed and subsequently issued without a single modification. Four accepted elevations are still under review. EPA has elevated only one permit under the new MOA; NMFS none.

LONGER PUBLIC COMMENT AND INTERAGENCY REVIEW PERIODS SHOULD BE RE-INSTATED

On June 8, 1982, Corps Headquarters directed the District Engineers to shorten the comment period on public notices. The New Orleans District obliged by reducing comment periods from 30 to 15 and in some cases 10 days. Besides affecting the ability of the public to participate in the permit process, shorter public comment periods adversely affect the reviewing agencies ability to review applications, determine appropriate mitigation measures, and decide whether they will object to a permit. In view of the limited resources of EPA, FWS, and NMFS and the large number of applications they must review, these reductions in the review period will diminish their ability to protect our water and wetland resources.

H.R. 3282 WOULD MAKE INTERAGENCY REVIEW OF PERMITS ONCE AGAIN A MEANINGFUL AND EQUITABLE PROCESS

As discussed above, the restrictions placed on interagency review in May 1982 are not warranted and have reduced environmental protection. These problems with the new,

'stream-lined' review process are perhaps best illustrated by Assistant Interior Secretary Arnett's comments in a January 7, 1983, letter to Assistant Army Secretary Giannelli:

> In view of your track record in not sustaining our elevation proposals, I elected not to elevate this action because by Alaska standards the direct project impact is small.
>
> Our view of the matter, however, is that the permit should not be issued because it will serve as an inducement for further development of an area that has significant wildlife resources. Second, there are alternate sites available. Third, the project is not water-dependent nor water-related. And fourth, we do not believe the public interest is served by after-the-fact permitting of an unauthorized fill, nor by compensating for a financial loss the applicant sustained at another location. For your convenience, I have enclosed a summary sheet regarding the proposed action.
>
> Bill, I agreed to the 1982 MOA in hopes it would result in timely but equitable decisions. It is just not reasonable to expend extensive manpower to meet the current permit review schedule to repeatedly have our concerns fall on deaf ears. I have not given up on the MOA, but suggest that expediting the permit process cannot and should not be at the expense of natural resource protection.

And again in a June 27, 1983 letter:

> Your comment regarding being "sensitive to quality of our decisions" is most perplexing in 'ight of the fact that you have issued permits for all fifteen of the applications elevated under the 1982 Memorandum of Agreement. To date, the issuance of permits on elevated issues has resulted in a direct loss of nearly 6,700 acres of wetlands.
>
> I believe the current MOA is limited to process implementation and largely ignores resource issues.

> As stated in the first subsection of Congress' Declaration of Goals and Policy, the Clean Water Act has as a "national goal wherever attainable" to provide for the "protection and propagation of fish, shellfish, and wildlife..." As now administered, the Corps' regulatory program causes me to have serious concerns about whether or not these clearly stated objectives are being accomplished.

Section 10(b) of H.R. 3282 seeks to make interagency review of permits once again a meaningful and equitable process. Section 404(q) would be amended to adopt the MOA procedures in effect between March 1980 and July 1982, but with shorter time frames and three levels of review rather than five. The amendment would once again allow Corps Division review of permit decisions, requests for further permit review based on resource considerations and sufficient time for federal resource agencies to evaluate permits having significant environmental effects. But most importantly H.R. 3282 removes the authority for the ASA-CW to veto requests by EPA, FWS, or NMFS for referral of objectional permit applications above the District Engineer for further review. H.R. 3282 would correct the present circumstances under the May 1982 MOA, which argue against EPA, FWS, or NMFS diverting scarce resources to prepare a permit referral because there is no certainty that the ASA-CW will agree to review the District Engineer's decision.

The net effect of the changes incorporated in the May 1982 MOA has been an increasing tendency on the part of Corps Districts to give less weight and sometimes to ignore EPA, FWS, and NMFS concerns. H.R. 3282 would restore the role Congress

intended for the federal resource agencies under the Clean Water Act and Fish and Wildlife Coordination Act, and we urge this Subcommittee to support Section 10(b) of H.R. 3282.

THERE ARE ADDITIONAL WAYS TO STREAMLINE PERMIT PROCESSING THAT WOULD ASSURE ADEQUATE PROTECTION OF RESOURCES

Once the interagency review process in H.R. 3282 has been established to provide adequate environmental protection, we suggest that processing times could be reduced without jeopardizing our wetland resources by:

1. Establishing procedures for pre-application consultation between the applicant, Corps and the reviewing agencies for categories of permits that are likely to be controversial;

2. Encouraging and expanding the use of joint state/federal permit application processing, including the issuance of joint public notices and the conduct of joint public hearings;

3. Encouraging and expanding the use of interagency joint processing meetings in order to weed out controversial applications, and approve non-controversial applications; and

4. Requiring that District Engineers make decisions on permit applications and appropriate mitigation rather than asking the applicant to negotiate mitigation conditions with the reviewing agencies. Such negotiations are time consuming and could be avoided if the District Engineers became decisionmakers rather than umpires. As decisionmakers the District Engineers could protect our resources by giving great weight to the recommendations of the reviewing agencies.

ADMINISTRATIVE WEAKENING OF THE 404(b) ENVIRONMENTAL GUIDELINES MUST BE PREVENTED

In addition to substantial revision of the MOA governing interagency review of 404 permits, another of the directives of the President's Task Force on Regulatory Relief stated that "The EPA's Section 404(b)(1) guidelines will be shortened, simplified, and made consistent with the reform measures described herein." On August 23, 1982, EPA complied with this directive by issuing an Advance Notice of Proposed Rulemaking concerning revisions to the 404(b)(1) guidelines. At that time EPA appeared to have pre-judged the need for substantial revisions to the guidelines. The notice stated that "comments are needed to identify parts of the guidelines that are ambiguous, difficult to apply, or that may result in excessive delays, regulatory burdens or costs." (Emphasis added).

The change in Administration at EPA has made it more uncertain whether the 404(b) guidelines will be revised and, if they are, whether they will be weakened. But Assistant Secretary Gianelli has pressed hard for substantial reductions in the environmental protection provided by the guidelines:

- On November 30, 1982, Assistant Secretary Gianelli sent EPA a marked up version of the guidelines which identifies portions that he felt could and should be omitted. Of the many recommended deletions, the most egregious was the proposed elimination of the current presumption against discharges of dredged or fill material into wetlands. (Letter attached in Appendix V.)

20-955 O—84——129

- On December 17, 1982, Assistant Secretary Gianelli wrote the Vice President to ask for his help in pressuring EPA to draft revisions to the 404(b) guidelines. (Letter attached in Appendix V.)

- On March 23, 1983, Assistant Secretary Gianelli again wrote the Vice President to ask him to intercede in a dispute between Army and EPA over whether the guidelines should be regulatory criteria or relegated to an advisory status. Army recommended that the Administration adopt the position that the guidelines are advisory in nature. (Letter attached in Appendix V.) EPA Administrator William Ruckelshaus has maintained that the guidelines should be binding criteria and that the dispute within the Administration has been resolved in favor of his position.

- Nevertheless, on October 5, 1983, Assistant Secretary Gianelli once again wrote the Vice President to advise him of the status of the regulatory reform effort and urge full implementation of the May 7, 1982 charter; in particular, to complete the directive of "shortening and simplifying" the 404(b) guidelines. (Letter attached in Appendix V.)

Thus, the threat that EPA's environmental 404(b) guidelines will be substantially revised and weakened remains very real. Of greatest concern is that revisions will, as Assistant Secretary Gianelli has recommended, eliminate the presumption against wetlands destruction from disposal of dredged or fill material.

Section 10(a) of H.R. 3282 would affirm fundamental standards for environmental protection contained in the EPA guidelines issued under Section 404(b) on December 24, 1980 (45 Fed. Reg. 85335 et seq.; 40 C.F.R. Par 230). The fundamental precept of these guidelines is that "dredged or fill material should not be discharged into the aquatic ecosystem, unless it

can be demonstrated that such a discharge will not have an unacceptable adverse impact either individually or in combination with known and/or probable impacts of other activities affecting the ecosystems of concern." 40 C.F.R. Section 230.1(c).

Section 10(a) of H.R. 3282 also would place the operational heart of the EPA guidelines in the statute: the requirement that discharge be prohibited "if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences." 40 C.F.R. Section 230.10(a). This requirement is made particularly effective by the so-called "water dependency" test. Simply put, that test prohibits the unnecessary destruction or alteration of wetlands where practicable alternative sites are available or where the project need not be located in a wetland to meet its objectives (i.e., is not 'water dependent'). For example, the construction of a marina is water dependent, whereas the construction of a shopping mall is not.

The immense value of wetlands and the stunning rate at which these resources are being destroyed certainly justify the presumption against development in wetlands. Moreover, the requirements of the EPA guidelines contained in H.R. 3282 have proven effective and flexible in protecting wetlands and other

aquatic ecosystems from degradation or destruction caused by discharges of dredged or fill material. The denial of the Section 404 permit for Marco Island (by Deltona) graphically demonstrates the importance of the presumption against wetlands development. But the presumption also has served to stem the tide of small projects that have a significant cumulative impact on the nation's wetlands and for which upland alternatives sites are available.

There is also a good policy reason for ensuring that the presumption is maintained. Private investors, aware of the presumption and the difficulty it would cause in securing a Section 404 permit for certain projects that are not water dependent, such as housing, have sought alternative sites. Thus, the present 404(b) guidelines have influenced expectations. Changes in the guidelines, such as those recommended by Assistant Secretary Gianelli, would alter those expectations and could undo the long-term protection of wetlands. Furthermore, revisions to the presumption would only create further confusion and chaos in an already complex area at a time when consistency is finally being achieved. Section 10(a) of H.R. 3282 would prevent changes and revisions in the presumption and would ensure continued protection for wetlands and predictability for developers. We urge this Subcommittee to adopt its provisions.

H.R. 1570 WOULD ADVERSELY IMPACT THE INTEGRITY OF ALL THE NATION'S WATERS

We urge this Subcommittee to strongly oppose the provisions of H.R. 1570. H.R. 1570 would remove from federal protection under Section 404 the vast majority of the nation's wetlands, perhaps 126 million of the 148 million acres currently covered, and thousands of miles of river and lake shoreline.

H.R. 1570 cannot be justified. As shown earlier, Section 404 is not stopping or significantly delaying development. Moreover, even if the Corps' program could be shown to be causing significant delay, the restrictive definition of 'navigable waters' proposed by H.R. 1570 would not solve the problem. Only 17 percent of all permit applications received by the Corps are for activities in non-navigable waters. And even if unreasonable delay could be demonstrated in this small percentage of permit application, legislation is not necessary to correct the problem. The Section 404 program has adequate tools for administrative and regulatory efficiency, and those tools are being employed and in some cases overutilized by the agencies. I suggested some approaches, such as joint processing of permits, earlier in my testimony.

H.R. 1570 also incorrectly asserts that the Section 404 permit program has not benefited the nation. The Corps IWR identified the reduction of wetlands losses attributable to Section 404 as an important reason why the Corps permit program provides net benefits to the nation.

More detailed description of the adverse impacts that would result from approval of H.R. 1570's provisions is attached as Appendix V.

CONCLUSION

Our wetlands are an immensely valuable economic and environmental resource. Nevertheless, more than 50% of our original wetlands are gone, and we continue to destroy our wetlands at the alarming rate of 458,000 acres per year. Section 404 is the only effective federal regulatory program that protects wetlands. Each year Section 404 cuts in half the destruction of wetlands from disposal of dredged or fill material. While Section 404 protects wetlands, it has not stopped development. Most of the wetland savings are realized through mitigation and project modifications.

H.R. 1570 would exempt from regulation under Section 404 approximately 125 million acres of wetlands. Left unprotected, these resources will be destroyed.

Two of the July 22, 1982 Corps nationwide permits leave most of our inland wetlands and water relatively unprotected. Even where individual permits are required, the interagency agreements negotiated in spring and summer 1982 have greatly reduced the ability of the federal resource agencies to obtain mitigation and project modifications necessary to prevent

destruction and degradation of our waters and wetlands. Again, mitigation and permit conditioning are responsible for most of the resource savings accomplished under Section 404.

Continued pressure on EPA to shorten and simplify its 404(b) guidelines poses a serious threat to the current presumption against discharges of dredged or fill material into wetlands.

H.R. 3282 would once again make interagency review equitable and meaningful and would ensure that the current protection for wetlands provided by the 404(b) guidelines would be maintained.

Therefore, we respectfully urge this Subcommittee to support H.R. 3282, to stop H.R. 1570, and to voice its opposition to the recent administrative and regulatory changes and proposed changes to Section 404.

APPENDIX I

National Wildlife Federation
Resolution on Section 404

NATIONAL WILDLIFE FEDERATION

1412 Sixteenth Street, N.W., Washington, D.C. 20036 202—797-6800

Resolution No. 18

DENOUNCES THE DISMANTLING OF THE SECTION 404 PERMIT PROGRAM

WHEREAS, Section 404 of the Clean Water Act has been an effective federal program for reducing wetland destruction and mitigating unavoidable wetland losses; and

WHEREAS, the program has saved an estimated 300,000 acres of wetlands each year since it was implemented; and

WHEREAS, recent administrative revisions to Section 404, including the granting of 26 nationwide permits that eliminate federal jurisdiction over most of the nation's wetlands, have weakened the permit program; and

WHEREAS, administrative proposals to change the definition of the word "wetlands" will harm the effectiveness of the Section 404 program in its goal to maintain the physical, biological, and chemical integrity of the nation's waters, and will reduce the program's ability to protect this nation's valuable wetland resources;

NOW, THEREFORE, BE IT RESOLVED that the National Wildlife Federation in annual meeting assembled March 17-20, 1983, in Albuquerque, New Mexico, hereby denounces the dismantling of the Section 404 permit program as both unlawful and contrary to the goals and objectives of the Clean Water Act, and counter to the public interest in wetland protection; and

BE IT FURTHER RESOLVED that the National Wildlife Federation asks Congress to enact legislation that reverses these administrative revisions and strengthens the provisions of Section 404 of the Clean Water Act.

APPENDIX II

Savings to Permit Applicants
From Section 404

ESTIMATED ANNUAL SAVINGS TO PERMIT APPLICANTS RESULTING FROM PROJECT REVIEW MODIFICATIONS

	Number of Permits FY 80	Total Financial Cost ($millions)	Benefit Coefficient a[1]	Benefit Coefficient b[2]	Amortization Factor[3]	Annual Benefits ($millions) a	Annual Benefits ($millions) b
Commercial	6,320	150,810	.00563	.01125	.1107	98.9	197.8
Individual	9,821	2,882	.00563	.01125	.1107	1.8	3.6
Government	2,798	33,927	.00563	.01125	.1107	34.8	69.7
TOTAL	18,939	217,619	.00563	.01125	.1107	135.5	271.0

[1] Assumes site development costs represent 25% of total project cost; 15% of projects are benefited; benefit represents a savings of 15% of site development costs. (.25 X .15 X .15 = .00563)

[2] Same assumptions as in 1 above, except assumes 30% of projects are benefited. (.25 X .30 X .15 = .01125).

[3] Assume projects' social value is amortized at 10% for 25 years.

APPENDIX III

State and EPA Comments on the
May 12, 1983 Proposed Section 404 Regulations

NATIONAL WILDLIFE FEDERATION

1412 Sixteenth Street, N.W., Washington, D.C. 20036 202—797-6800

WIDESPREAD STATE REJECTION OF THE PROPOSED RULES

NORTH DAKOTA:

We particularly reject your facade of regulatory relief. Plain and simple, what you propose is the removal of necessary environmental safeguards for America's aquatic resources. This is particularly cruel because it comes at a time when the Supreme Court of the United States has declared our wetlands "a national treasure of nearly the highest magnitude." If you are so intent on regulatory reform, we suggest you modify your regulations to increase protection to our nation's aquatic resources as Congress clearly intended. (Dale L. Henegar, Commissioner, North Dakota Game and Fish Department)

INDIANA:

It seems grossly inconsistent that the administration in Washington is strongly advocating wetland preservation, while the U.S. Army Corps of Engineers is attempting to abolish one of the most effective methods of wetlands protection ... The Assistant Secretary's proposal would "hamstring" the major protective measures intended to be utilized for the best public interest. (Edward L. Hansen, Director, Indiana Division of Fish and Wildlife)

WISCONSIN:

The proposed regulations would seriously undermine, if not effectively destroy, the Corps of Engineers' regulatory program mandated by the Clean Water Act and the River and Harbor Act of 1899 ... (C.D. Besadny, Wisconsin Department of Natural Resources)

MARYLAND:

Your proposed regulations would undermine the protection of nontidal wetlands and also contribute to the loss of tidal wetlands. As we begin to take strides to improve the Chesapeake Bay, your proposed weakening of wetland protection would result in further deterioration of the Bay system through wetland destruction in Pennsylvania, in Virginia, and in Maryland. (Senate of Maryland)

PENNSYLVANIA:

While we agree that all permit applications should be acted upon in a timely manner, we do not believe that this excuse should be used as a reason for removing or weakening protection from such a vital segment of our natural environment, the waterways and wetlands of the United States. Studies have shown that only a very small percentage of the applications have been held up, and most of these had serious environmentally damaging implications. (Ralph W. Abele, Executive Director, Pennsylvania Fish Commission)

-more-

MASSACHUSETTS:

The Commonwealth of Massachusetts continues to be opposed to the apparent trend, reflected by the COE proposed regulations, toward the weakening and reduction of protection for the nation's wetlands. Massachusetts believes that the changes proposed by the newest revisions to the Corps regulations will accelerate the loss of wetlands not only in Massachusetts but nationwide. Study after study has shown that there is a clear relationship between the loss of wetlands and several environmental impacts including: an increase in groundwater contamination, increased property damage, decreases in migratory waterfowl populations, and decreases in commercial fisheries. (Michael S. Dukakis, Governor, Commonwealth of Massachusetts)

WISCONSIN:

Rather than proposing amendments to the rules that would provide project applicants with a sense of regulatory uniformity, predictability, efficiency, and equal treatment consistent with the substantive provisions of the law, the Corps has chosen to erode the substance of the law itself in the name of "regulatory relief." Yet, by making changes in the rules of the game midstream, and by proposing new definitions that require frequent and complicated cross-referencing within the code, not even the ostensible goal of regulatory relief and uniformly fair decisionmaking is achieved. Only damage to achievement of CWA objectives is left in their wake. (Thomas J. Dawson, Public Intervenor, Wisconsin Department of Justice)

MOST INLAND WETLANDS REMAIN UNPROTECTED BY AMENDED NATIONWIDE PERMITS

Despite a pending suit brought by the National Wildlife Federation, the Environmental Defense Fund, the National Audubon Society, and thirteen other conservation groups, the International Association of Fish and Wildlife Agencies and the American Fisheries Society challenging the legality of water classification as a basis for nationwide permitting, the Corps' Proposed Rule (Section 330.4(a)) continues to authorize nationwide permits for dredged or fill discharge into "isolated lakes and wetlands" and any wetlands and other waters located above "the headwaters of streams."

The July 1982 issuance of these two permits authorized the essentially unregulated development of all isolated inland wetlands. While the current amendments would reinstate a pre-1982 exception requiring individual permits for discharges into lake/wetland areas ten acres or larger in size, they also introduce the additional requirement of at least five acres of open water (Section 330.2). This "five acre open water qualification" severely restricts the wetland/lake areas subject to project review on an individual permitting basis, leaving a critical majority of our inland waters and wetlands vulnerable to the destructive impacts of unregulated development.

****

Environmental Protection Agency:
Even with inclusion of the May 12th 10 acre natural lake limitation, this section will generally permit discharges in very large areas of wetlands in New England (perhaps as much as 50% of freshwater wetlands), the Pocono region of Pennsylvania (as much as 60% of wetlands), and the prairie pothole region of the Dakota's (as much as 70%), among others. These are all environmentally important regions. Thus, in these areas, the discharges authorized by the permit could have significant adverse individual or cumulative effects ... large fill projects that have significant adverse impacts on water quality, flood storage capacities, and the aquatic ecosystem may be authorized. In our view, most truly minor activities in isolated waters or in waters above the headwaters are (or could be) covered under other general permits. Therefore, the primary effect of these geographic permits may be to authorize precisely the type of projects with which we are concerned... The prior regulation contained no criteria for ratio of open waters to wetlands. The logic of imposing this ratio does not appear scientifically supportable. For example, under the proposal a 5 acre lake with 5 acres of adjacent wetland would come under individual permit review, while a 3 acre lake with 25 (or 250) acres of adjacent wetlands would be excluded from individual permit review. The latter area could, of course, be significantly more valuable than the former.

Iowa Conservation Commission:
The total of wetlands and small lake losses to unregulated dredging or filling would be enormous on a national scale. This loophole alone significantly reduces the Corps' responsibility to carry out the intent of 404.

Illinois Department of Conservation:
In our opinion, the open water requirement will make many large and significant wetland areas subject to filling without benefit of individual permits. Additionally, it will create an entirely new area of confusion in determining Corps jurisdiction

-more-

UNLAWFUL NATIONWIDE PERMITS PROPOSED

The Clean Water Act (CWA) restricts the use of nationwide general permits to categories of activities that are similar in nature, cause only "minimal individual or cumulative adverse environmental effects" and have been determined by the Army Corps of Engineers (Corps) to meet the environmental standards outlined in the Section 404(b)(1) Guidelines of the Environmental Protection Agency (EPA). These restrictions met, nationwide general permit activities are exempt from Corps project-by-project review, public notice or comment and interagency oversight performed under the individual permit process.

Two new permits (26 & 27) in the Proposed Rule (Section 330.5) fail to meet the nationwide permit criteria. Permit (26) exempts from individual permit requirements all dredged or fill discharges into U.S. waters by federal projects or projects receiving federal permits, licenses, or funding including highways, military installations, levees, canals, irrigation projects, housing developments, hydroelectric dams, sewage treatment plants and systems, port expansion and power plants. Permit (27) exempts from individual permit requirements filling and other activities associated with construction of facilities, public or private, adjacent to Corps' civil works projects which are economically compatible with the Corps project. Under the auspices of Permit (27), activities as diverse as agriculture, industry and commercial development could conceivably fall under one nationwide permit if planned along a Corps-channelized river.

The permits fail to meet the criteria for issuance of nationwide permits. They authorize dissimilar activities whose potential to cause adverse environmental effects can only be adequately measured against EPA standards on an individual permitting basis. Permit (26) does require federal agency assurance of 'no significant environmental impact'. However, this constitutes an illegal transfer of CWA Corps- and EPA-vested authority to other federal agencies whose oversight of their own development proposals is clearly divisive to uniform Section 404 decision-making and environmental protection. While instructing the Corps to conduct a case-by-case analysis, Permit (27) does not even explicitly require compliance with EPA Guidelines.

****

Environmental Protection Agency:
The two new permits proposed on May 12, numbers 26 and 27, illustrate a regulatory approach of concern to EPA that recurs throughout these proposed rules: an apparent willingness to forego environmental review responsibilities under the Clean Water Act for reasons of administrative expediency, and to delegate to local, state, and other federal agencies the Corps' and EPA's Section 404 responsibilities. We are opposed to nationwide permits 26 and 27 and recommend that they be dropped for the following reasons:

Permit (26) - This nationwide permit is of particular concern. It would authorize any type or size of project no matter how significant, so long as the proponent federal agency and the Corps of Engineers, with no notice to or consultation with, the public and other affected agencies, determine that it conforms with 404(b)(1). We no not believe that an authorization of this magnitude meets the limitations imposed upon general permits under Section 404(e) of the Clean Water Act. It would also have the effect of abrogating the authority of EPA to review these projects for 404(b)(1) compliance and possible use of our 404(c) authority. It would prevent or inhibit the use of EPA's expertise in environmental matters relating to permitted projects.

Permit (27) - This permit raises similar concerns. It would authorize an unlimited range of projects with only an internal 404 "analysis" by the Corps (not even an internal finding of compliance). For example, we could foresee this permit authorizing a major marina or industrial facility next to a dredged federal channel without adequate federal, state, or public review. A project which is merely at the conceptual stages and may be unsound on its own merits should not be allowed to proceed merely because it is adjacent to previously authorized work. This permit has the strong potential to authorize activities that are significant, not minimal, in nature. ... In addition, the lack of consultation with EPA in determining 404(b)(1) compliance is unacceptable. It does not allow EPA sufficient opportunity to consider the use of Section 404(c). EPA strongly opposes this permit, as we believe we must have an opportunity to review, for Section 404(b)(1) compliance and 404(c) considerations, detailed project plans for specific 404 related actions.

Illinois Department of Conservation:
In our opinion the proposed nationwide permits may authorize a range of dissimilar activities with uncertain cumulative impacts. Since the states and general public receive no notification of individual actions permitted under the nationwide system, they will also remove the state and individual rights to comment on matters of possible concern. We recommend that both nationwide permits be deleted from the proposed regulations.

Pennsylvania Fish Commission:
How can a permit for "specific activities" cover "Structures, work, and discharges of dredged or fill material" regardless of whether it is done by a federal agency or anyone else? The phrase of "Structures, work, and discharges of dredged or fill materials" is about as non-specific as one can get ... There are federal agencies or departments who do not have personnel with the training or expertise to adequately determine if the structure, work, or discharge will cause significant degradation to the waters of the United States.

New Jersey Department of Environmental Protection:
Both of these proposed nationwide permits would create the possibility of Corps authorization of projects which are inconsistent with New Jersey's Coastal Management Program since Program policies address a broader range of concerns than do 404(b)(1) guidelines. These proposed permits could be applied to projects having major adverse environmental impacts, without public participation. They are not consistent with Federal Law since they could apply to activities which are not "Similar in nature" or cause "only minimal adverse environmental impacts", as required by the Clean Water Act (Section 404(e)(1)).

Iowa Conservation Commission:
Permit (27) would allow any projects adjacent to a Corps civil works project to proceed without individual permit review. The losses to adjacent wetlands, many of which are of seasonal importance to migratory birds, would be enormous.

Missouri Department of Natural Resources:
(26) We object to the issuance of a nationwide permit for projects which are undertaken, funded, or authorized by another federal agency. These activities could include highway projects, including bridges, dams, hydropower projects, channelizations as well as many other projects. Section 404(e) of the Clean Water Act specifies that a general permit may only be issued for an activity or category which is "... similar

-more-

which is directly counter to the stated purpose of these regulatory reforms. For example, the extent of wetland vegetation around the margins of a lake may vary from year to year because of such things as natural growth, ice conditions during the previous winter, and cutting by adjacent homeowners. Thus, the acreage of open water--and the level of Corps jurisdiction--may have to be recalculated annually in some cases. Further, U.S.G.S. topographic maps, from which many acreage determinations will no doubt be made, do not depict annual changes in the ratio of open water to adjacent wetlands.

in nature, will cause only minimal adverse environmental effects when performed separately, and will have only minimal cumulative adverse effects on the environment." This proposed nationwide permit in no way conforms to those requirements. These projects are obviously not similar in nature nor can they be considered to have minimal adverse environmental effects.

(27) We also object to the issuance of this nationwide permit. This permit would include such Corps activities as dams, reservoirs, channelizations, levees, and other projects. Again, these activities are not similar in nature and definitely do not have minimal adverse environmental effects.

INFRINGEMENT ON STATE WATER QUALITY PROTECTION RIGHTS

The CWA protects the ultimate authority of states over their aquatic resources. Individual or general permits can only be issued by the Corps after the state, whose waters will be affected by the discharge, either certifies that the permits comply with state water quality requirements or waives the right to certify. Through a series of regulatory gymnastics, the Proposed Rule unlawfully undercuts states' water quality certification rights under the CWA.

The Proposal (Section 325.2(b)(1)(ii)) omits the current requirement for Corps certification requests to proceed in accordance with existing state procedures. It also shortens the time states have to review requests before waiving the right of certification, from sixty to thirty days. Even if the existing procedural framework were to be maintained, in many cases thirty days is an insufficient length of time for adequate project review.

Of paramount concern is the Proposal's (Section 330.9) illegal authorization of nationwide general permits without state certification or waiver. Even if a state denies certification the nationwide permits will be issued. It will then be the state's responsibility to conduct an individual review of each proposed activity covered under the nationwide permit to determine whether an individual certification should be waived or denied. Thus the responsibility and administrative burden of individual permit review would be unlawfully shifted from the Corps to the states — a tactical maneuver by the Corps to effectively coerce states into certifying nationwide permits.

****

West Virginia Department of Natural Resources:
Since our comments were not taken into consideration as evidenced by your further reduction in review/certification time, we demand that permits not be issued until Certification has been granted or waived in writing by this Department. Any permits issued without Certification are not sanctioned by the State of West Virginia and are therefore unauthorized and illegal.

Minnesota Pollution Control Agency:
The proposed rules seem to assert that if the State denies certification, the nationwide permit is still issued for that State. We feel this approach is unlawful, and that it is merely an attempt to shift the administration of a Federal Permit program from the Corps to the States. This would impose a significant resource burden on the State. We feel the Clean Water Act unequivocally provides that no permit may be issued if the State denies certification. Any attempt to shift administrative burden to the State, in what we feel is an unlawful manner, may serve only to inhibit cooperation that has been developed between the State and the Corps.

Missouri Department of Natural Resources:
We strongly object to your proposal to issue nationwide general permits even if the state denies the 401 certification for the nationwide permit ... Missouri does not have the capability to assume this added burden. In our opinion, this proposed rule only circumvents the intent of Section 401 of the Clean Water Act.

-more-

20-955 O—84——130

Florida Department of Environmental Regulation:
Given the development pressure in a rapidly growing state such as Florida which results in a heavy workload on our permitting staff and the complexity of many projects we evaluate, 30 days is clearly an unreasonable response time. This change would leave the state no choice but to deny every certification in order to protect its right to clean waters.

Wisconsin Department of Justice:
The Corps does not have authority to issue a general permit for which a state has denied water quality certification, such as the State of Wisconsin. Such permits are legal nullities. The Corps has no business adopting a general permit for which a certification has been denied, and leading applicants in the belief that they can convert a legal nullity into an authorization on an individual basis.

Wisconsin Department of Natural Resources:
This provision ... is an obvious attempt to foist upon the states the administrative and enforcement responsibility for large portions of the waters of the United States. If these proposed provisions are contained in the final rules, we would have no alternative but to initiate litigation to contest this rule.

RESTRICTIVE WETLANDS DEFINITION CUTS PROTECTION

The Proposed Rule (Section 328.3) tampers with the definition of "wetlands" to, in effect, remove many important wetland types from Section 404 jurisdiction. Reduced protection of the wetland resource violates the objective of the CWA by disregarding the critical role many excluded wetlands play in protecting "the physical, chemical, and biological integrity of the nation's waters..."

Corps restriction of Section 404 regulatory scope is expressly prohibited by a 1979 Attorney General's Opinion which reaffirmed EPA authority over Section 404 jurisdictional determinations. While maintaining the current definition of wetlands:

> ...those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs and similar areas.

The Proposed Rule introduces, beneath the guise of clarification, meanings for key terms used in the definition.

Particularly objectionable is the proposed qualification of the term "prevalence of vegetation" as "those rooted emergent plants that comprise at least 50% of the dominant species within a plant community." Scientists interpret the phrase "rooted emergent plants" to include only root-bearing herbaceous plants. Excluded from this definition are all wetlands dominated by non-rooted floating aquatic vegetation and moss-lichens such as bogs and many freshwater marshes as well as all tree- and shrub-dominated wetlands including forested bottomlands and cyprus-tupelo swamps. In addition, since ecological dominance is a relative term with a myriad of site-specific interpretations, the "50% dominance" requirement offers confusion rather than clarification to the definition of wetlands.

Using the Fish and Wildlife Service classification scheme, an estimated two-thirds of the 99 million acres of wetlands in the coterminous states are not dominated by emergent vegetation and would thus be removed from Section 404 jurisdiction. In addition, millions of acres of tundra would no longer be considered wetlands because tundra vegetation does not emerge from the water.

****

Environmental Protection Agency:
Because the definitions contained in this part determine the scope of jurisdiction of the Section 404 program and were proposed without our concurrence, these changes are inconsistent with the legal opinion of the Attorney General (Civiletti Opinion, September 5, 1979) that EPA has responsibility for determining the scope of jurisdiction for all programs under the Clean Water Act.

Illinois Department of Conservation:
In Illinois this definition would eliminate marshes dominated by submersed or floating non-rooted plants and possibly forested bottomland swamps (which are dominated by woody vegetation not generally defined as "emergent" as well.

Wisconsin Department of Natural Resources:
If adopted as proposed, over two-thirds of Wisconsin wetlands which are presently covered by the Act would be left without coverage under Section 404 of the Clean Water Act.

Missouri Department of Natural Resources:
If the Corps proposes to eliminate jurisdiction over shrub/shrub wetlands and bottomland hardwoods through the use of these definitions, the state strongly objects to the wording changes. The term "emergent" is not defined, but usually refers to herbaceous, non-woody vegetation and would eliminate forested and shrub/shrub wetlands jurisdiction.

Missouri Department of Conservation:
We strongly object to the proposed revisions to the definition of the term "wetlands." In our estimation, these definitions will result in reduced resource protection in Missouri.

MISPLACED BURDEN OF PROOF PROMOTES DISCHARGES

The Proposed Rule (Section 320.4) would change the policy statement regarding Section 404 Public Interest Review procedure from "No permit will be granted unless its issuance is found to be in the public interest." to "A permit will be granted unless its issuance is found to be contrary to the public interest."

Current policy requires the permit applicant--also the direct beneficiary of permit issuance--to demonstrate that a proposed discharge is not environmentally damaging and is in the public interest. The proposed policy change would shift the burden of proof from the applicant to the Corps and other involved government agencies as well as concerned citizens. The Corps would thus shoulder responsibility for proving that a proposed project would be economically unsound or would have adverse environmental impacts as a basis for permit denial. In cases where insufficient information exists, the Corps would no longer be required to deny permits on the basis of "possible" adverse environmental impacts.

The Proposed Rule introduces a bias towards permit approval. It presumes all permit proposals to be both environmentally acceptable and in the best interest of the public unless proven otherwise. This violates the presumption against discharges (1) implicit in the goal of the CWA to "restore and maintain the chemical, physical and biological integrity of the Nation's waters..."; (2) explicit in the fundamental precept of the EPA Guidelines "that dredged or fill material should not be discharged into the aquatic ecosystem, unless it can be demonstrated that such a discharge will not have an unacceptable adverse impact."' and (3) reflected in current procedure requiring the applicant to prove environmental acceptability.

****

Environmental Protection Agency:
This burden of proof issue is of serious concern to EPA. A premise of the Clean Water Act is that discharges which may be "reasonable" from a private point of view may be "unreasonable" from a public water quality perspective and should therefore be regulated. The statute was written to protect important public resources from the effects of incremental decisions being made by individuals. While such decisions often involve relatively small acreages in each instance, they have been the major contributor to our national annual loss of hundreds of thousands of acres of wetlands (approximately 75,000 acres in Louisiana alone). This dramatic rate of loss has resulted not because of a national or state-wide decision that destroying a certain amount of wetlands is environmentally acceptable, but because individuals had been allowed to decide, indirectly, the value of these ecosystems for the nation as a whole. The weakness of that system led to the formulation of the existing 404 regulatory program and, more specifically, to the approach of a presumption against discharge. Logically, this places the burden of proof on the applicant to show that the discharge will not be harmful--this shift in burden of proof is likely to bias the permit issuance decision-making process in a manner that will impair efforts to minimize damage to, or loss of, important environmental resources.

Iowa Conservation Commission:
Virtually every project in waters of the U.S. causes some disruption of public interest factors. The burden of proof as to the desirability of the project should remain with the applicant to demonstrate that the project will not injure the public interest, including the public resources therein mandated for protection under the

-more-

CWA. The Corps' proposal to change their regulations in this regard would not only be inconsistent with the Act and significant judicial decisions, but would cause considerable confusion with the 404 regulatory program. It would become virtually impossible for the Corps to justify denial of a permit for projects damaging "waters of the U.S." or to apply meaningful mitigation measures.

New Jersey Department of Environmental Protection:
DEP opposes this proposal to shift the burden of proof from the applicant to the Corps because it may result in diminished protection for the nation's waters, including wetlands. The proposed language would make it more difficult for the Corps to deny permits since projects are presumed to be in the public interest. Therefore, the Corps will not be required to evaluate the public interest criteria listed below as strictly as it has previously evaluated them.

Missouri Department of Conservation:
We object to the wording, "A permit will be granted unless its issuance is found to be contrary to the public interest." This is contrary to the presumption against discharges into the nation's waters mandated by the Clean Water Act.

FISH AND WILDLIFE VALUES SLIGHTED

The Proposed Rule (Section 320.4(c)) would delete from Section 404 regulatory policy explicit instruction to the Corps to give "great weight" to the views of the U.S. Fish and Wildlife Service, the National Marine Fisheries Service and to pertinent state fish and wildlife agencies in permitting decisions. In compliance with the Fish and Wildlife Coordination Act (FWCA), the Proposed Rule retains instruction to the Corps to consult with these other agencies for guidance in protecting fish and wildlife resources. However, deletion of the 'great weight directive' downplays the importance that the Corps is congressionally mandated by the FWCA to give to both consideration of fish and wildlife values and to the expert views of federal and state officials.

****

Illinois Department of Conservation:
We do not agree that all references to "great weight" should be deleted from the Corps regulatory program. In our opinion, the original references were intended to stress the importance of specific factors in the public interest review including concern for the protection of wetlands and coordination with state and federal fish and wildlife agencies. We believe these factors are still of paramount importance and should be identified as such by the "great weight" designation. However, we would not be opposed to review and possible deletion of the July 22, 1982 revisions awarding "great weight" status to energy projects and navigation, which are often in direct conflict with fish and wildlife concerns.

New York Department of Environmental Conservation:
The special weight now given to these issues of public interest is a matter of statute and/or a clear expression of congressional policy and intent. The Corps must give such weight to these matters to fully carry out the statutory requirements and fulfill its role as trustee of these public resources. To fail to give "great weight" would deny that public policy, as represented in laws, executive orders, and so forth clearly expresses the notion that some considerations are generally more important than others.

Missouri Department of Conservation:
The State's Fish and Wildlife Agency and the U.S. Fish and Wildlife Service should decide if the project's effects to fish and wildlife are minor, not the District Engineer. We object to granting this authority to the Corps.

West Virginia Department of Natural Resources:
The deletion of emphasis on environmental factors such as fish and wildlife and water conservation is contrary to the whole tenet of the Clean Water Act. This proposed change should not be implemented.

APPENDIX V

Correspondence from Assistant
Army Secretary William Gianelli
on EPA's 404(b)(1) Guidelines

DEPARTMENT OF THE ARMY
OFFICE OF THE ASSISTANT SECRETARY
WASHINGTON, DC 20310

November 30, 1982

Honorable Eric Eidsness
Assistant Administrator for Water
Environmental Protection Agency
Washington, D. C. 20460

Dear Mr. Eidsness:

At our meeting on November 22d, you asked that we give you specifics on those portions of the 404(b)(1) guidelines having to do with policy statements and definitions which we felt could and should be omitted from the guidelines. Attached is a marked up version of the guidelines which should be helpful to you in this regard.

As I indicated to you at the time of our meeting last week, I am very concerned that we are not complying with the timetable of the Presidential Task Force on completing our regulatory reform effort on the 404 program. At this time the 404(b)(1) guidelines under preparation by your office are lagging behind the other efforts and constitute the bottleneck in the reform effort.

Reaching OMB with a Notice of Proposed Rulemaking on the guidelines which are to be developed in conjunction with the Army during the month of December is a hollow objective unless a draft is available to us very soon. Accordingly, in view of the long period of time EPA has known of the timetable, it would seem to me that you should make every effort to have such a draft in our hands not later than the end of next week. As Chairman of the Army-OMB reform effort, I expect to be reporting our reform progress to the Presidential Task Force, together with explanations as to why the timetable is not being met.

Sincerely,

Bill Gianelli

William R. Gianelli
Assistant Secretary of the Army
(Civil Works)

PART 230—SECTION 404(b)(1) GUIDELINES FOR SPECIFICATION OR DISPOSAL SITES FOR DREDGED OF FILL MATERIAL

Subpart A—General

Sec.
230.1 Purpose and policy.
230.2 Applicability.
230.3 Definitions.
230.4 Organization.
230.5 General procedures to be followed.
230.6 Adaptability.
230.7 General permits.

Subpart B—Compliance With the Guidelines

230.10 Restrictions on discharge.
230.11 Factual determinations.
230.12 Findings of compliance or non-compliance with the restrictions on discharge.

Subpart C—Potential Impacts on Physical and Chemical Characteristics of the Aquatic Ecosystem

230.20 Substrate.
230.21 Suspended particulates/turbidity.
230.22 Water.
230.23 Current patterns and water circulation.
230.24 Normal water fluctuations.
230.25 Salinity gradients.

Subpart D—Potential Impacts on Biological Characteristics of the Aquatic Ecosystem

230.30 Threatened and endangered species.
230.31 Fish, crustaceans, mollusks, and other aquatic organisms in the food web.
230.32 Other wildlife.

Subpart E—Potential Impacts on Special Aquatic Sites

230.40 Sanctuaries and refuges.
230.41 Wetlands.
230.42 Mud flats.
230.43 Vegetated shallows.
230.44 Coral reefs.
230.45 Riffle and pool complexes.

Subpart F—Potential Effects on Human Use Characteristics

230.50 Municipal and private water supplies.
230.51 Recreational and commercial fisheries.
230.52 Water-related recreation.
230.53 Aesthetics.
230.54 Parks, national and historic monuments, national seashores, wilderness areas, research sites and similar preserves.

Subpart G—Evaluation and Testing

230.60 General evaluation of dredged or fill material.
230.61 Chemical, biological, and physical evaluation and testing.

Subpart H—Actions to Minimize Adverse Effects

230.70 Actions concerning the location of the discharge.
230.71 Actions concerning the material to be discharged.
230.72 Actions controlling the material after discharge.
230.73 Actions affecting the method of dispersion.
230.74 Actions related to technology.
230.75 Actions affecting plant and animal populations.
230.76 Actions affecting human use.
230.77 Other actions.

Subpart I—Planning To Shorten Permit Processing Time

230.80 Advanced identification of disposal areas.

Authority: This regulation is issued under authority of Sections 404(b) and 501(a) of the Clean Water Act of 1977, 33 U.S.C. § 1344(b) and § 1361(a).

Subpart A—General

§ 23.1 Purpose and policy.

(a) The purpose of these Guidelines is to restore and maintain the chemical, physical, and biological integrity of waters of the United States through the control of discharges of dredged or fill material.

does not fully state the policy section of CWA which also gives primary responsibility to the states and requires drastic minimization of paperwork and decision processes. This purpose and policy section strongly biases ~~[illegible]~~ actions towards stn Federal control

(b) Congress has expressed a number of policies in the Clean Water Act. These Guidelines are intended to be consistent with and to implement those policies.

(c) Fundamental to these Guidelines is the precept that dredged or fill material should not be discharged into the aquatic ecosystem, unless it can be demonstrated that such a discharge will not have an unacceptable adverse impact either individually or in combination with known and/or probable impacts of other activities affecting the ecosystems of concern.

(d) From a national perspective, the degradation or destruction of special aquatic sites, such as filling operations in wetlands, is considered to be among the most severe environmental impacts covered by these Guidelines. The guiding principle should be that degradation or destruction of special sites may represent an irreversible loss of valuable aquatic resources.

§ 230.2 Applicability.

(a) These Guidelines have been developed by the Administrator of the Environmental Protection Agency in conjunction with the Secretary of the Army acting through the Chief of Engineers under section 404(b)(1) of the Clean Water Act (33 U.S.C. 1344). The Guidelines are applicable to the specification of disposal sites for discharges of dredged or fill material into waters of the United States. Sites may be specified through:

(1) The regulatory program of the U.S. Army Corps of Engineers under sections 404(a) and (e) of the Act (see 33 CFR 320, 323 and 325);

(2) The civil works program of the U.S. Army Corps of Engineers (see 33 CFR 209.145 and section 150 of Pub. L. 94–587, Water Resources Development Act of 1976);

(3) Permit programs of States approved by the Administrator of the Environmental Protection Agency in accordance with sections 404(g) and (h) of the Act (see 40 CFR 122, 123 and 124);

(4) Statewide dredged or fill material regulatory programs with best management practices approved under section 208(b)(4)(B) and (C) of the Act (see 40 CFR 35.1560);

which meet criteria specified in section 404(r) of the Act.

(b) These Guidelines will be applied in the review of proposed discharges of dredged or fill material into navigable waters which lie inside the baseline from which the territorial sea is measured, and the discharge of fill material into the territorial sea, pursuant to the procedures referred to in paragraphs (a)(1) and (a)(2) above. The discharge of dredged material into the territorial sea is governed by the Marine Protection, Research, and Sanctuaries Act of 1972, Pub. L. 92–532, and regulations and criteria issued pursuant thereto (40 CFR Part 220–228).

(c) Guidance on interpreting and implementing these Guidelines may be prepared jointly by EPA and the Corps at the national or regional level from time to time. No modifications to the basic application, meaning, or intent of these Guidelines will be made without rulemaking by the Administrator under the Administrative Procedure Act (5 U.S.C. 551 *et seq.*).

§ 230.3 Definitions.

For purposes of this Part, the following terms shall have the meanings indicated:

(a) The term "Act" means the Clean Water Act (also known as the Federal Water Pollution Control Act or FWPCA) Pub. L. 92–500, as amended by Pub. L. 95–217, 33 U.S.C. 1251, *et seq.*

~~(b) The term "adjacent" means bordering, contiguous, or neighboring. Wetlands separated from other waters of the United States by man-made dikes or barriers, natural river berms, beach dunes, and the like are "adjacent wetlands."~~

~~(c) The terms "aquatic environment" and "aquatic ecosystem" mean waters of the United States, including wetlands, that serve as habitat for interrelated and interacting communities and populations of plants and animals.~~

~~(d) The term "carrier of contaminant" means dredged or fill material that contains contaminants.~~

~~(e) The term "contaminant" means a chemical or biological substance in a form that can be incorporated into, onto or be ingested by and that harms aquatic organisms, consumers of aquatic organisms, or users of the aquatic environment, and includes but is not limited to the substances on the 307(a)(1) list of toxic pollutants promulgated on January 31, 1978 (43 FR 4108).~~

(f) [Reserved]

(g) [Reserved]

(h) The term "discharge point" means the point within the disposal site at which the dredged or fill material is released.

None of these definitions relate to "effects of disposal of pollutants" or to "degradation of waters." Some definitions should be retained because they don't appear other places in Federal regulations or in the statute.

statute uses the term pollutant and defines it in Sec. 502(6).

(i) The term "disposal site" means that portion of the "waters of the United States" where specific disposal activities are permitted and consist of a bottom surface area and any overlying volume of water. In the case of wetlands on which surface water is not present, the disposal site consists of the wetland surface area.

(j) [Reserved]

(k) The term "extraction site" means the place from which the dredged or fill material proposed for discharge is to be removed.

(l) [Reserved]

(m) The term "mixing zone" means a limited volume of water serving as a zone of initial dilution in the immediate vicinity of a discharge point where receiving water quality may not meet quality standards or other requirements otherwise applicable to the receiving water. The mixing zone should be considered as a place where wastes and water mix and not as a place where effluents are treated.

(n) The term "permitting authority" means the District Engineer of the U.S. Army Corps of Engineers or such other individual as may be designated by the Secretary of the Army to issue or deny permits under section 404 of the Act; or the State Director of a permit program approved by EPA under § 404(g) and § 404(h) or his delegated representative.

~~(o) The term "pollutant" means dredged spoil, solid waste, incinerator residue, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials not covered by the Atomic Energy Act, heat, wrecked or discarded equipment, rock, sand, cellar dirt, and industrial, municipal, and agricultural waste discharged into water. The legislative history of the Act reflects that "radioactive materials" as included within the definition of "pollutant" in section 502 of the Act means only radioactive materials which are not encompassed in the definition of source, byproduct, or special nuclear materials as defined by the Atomic Energy Act of 1954, as amended, and regulated under the Atomic Energy Act. Examples of radioactive materials not covered by the Atomic Energy Act and, therefore, included within the term "pollutant", are radium and accelerator produced isotopes. See *Train* v. *Colorado Public Interest Research Group, Inc.*, 426 U.S. 1 (1976).~~

This goes well beyond "404" pollutants and does not contain the exclusions in the statute regarding sewage from vessels and oil and gas production.

~~(p) The term "pollution" means the man-made or man-induced alteration of the chemical, physical, biological or radiological integrity of an aquatic ecosystem.~~

unnecessary

~~(q) The term "practicable" means available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes.~~

policy call

those sites identified in Subpart E. They are geographic areas, large or small, possessing special ecological characteristics of productivity, habitat, wildlife protection, or other important and easily disrupted ecological values. These areas are generally recognized as significantly influencing or positively contributing to the general overall environmental health or vitality of the entire ecosystem of a region. (See 230.10(a)(3))

This is a "made-up" term which goes beyond statutory requirements.

(r) The term "territorial sea" means the belt of the sea measured from the baseline as determined in accordance with the Convention on the Territorial Sea and the Contiguous Zone and extending seaward a distance of three miles.

Does not relate to "effects"

(s) The term "waters of the united States" means:

(1) All waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide;

(2) All interstate waters including interstate wetlands;

(3) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation or destruction of which could affect interstate or foreign commerce including any such waters:

(i) Which are or could be used by interstate or foreign travelers for recreational or other purposes; or

(ii) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or

(iii) Which are used or could be used for industrial purposes by industries in interstate commerce;

(4) All impoundments of waters otherwise defined as waters of the United States under this definition.

(5) Tributaries of waters identified in paragraphs (1)–(4) of this section;

(6) The territorial sea;

(7) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (s)(1)–(6) of this section; waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR § 423.11(m) which also meet the criteria of this definition) are not waters of the United States.

This is a jurisdictional call not related to "effects" of a discharge. While we acknowledge EPA's primary role in determining jurisdiction, we believe that the proper place to incorporate this for the benefit of the interest public is in the regulations governing the program, 33 CFR.

(t) The term "wetlands" means those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs and similar areas.

The Guidelines are divided into eight subparts. Subpart A presents those provisions of general applicability, such as purpose and definitions. Subpart B establishes the four conditions which must be satisfied in order to make a finding that a proposed discharge of dredged or fill material complies with the Guidelines. Section 230.11 of Subpart B, sets forth factual determinations which are to be considered in determining whether or not a proposed discharge satisfies the Subpart B conditions of compliance. Subpart C describes the physical and chemical components of a site and provides guidance as to how proposed discharges of dredged or fill material may affect these components. Subparts D–F detail the special characteristics of particular aquatic ecosystems in terms of their values, and the possible loss of these values due to discharges of dredged or fill material. Subpart G prescribes a number of physical, chemical, and biological evaluations and testing procedures to be used in reaching the required factual determinations. Subpart H details the means to prevent or mimimize adverse effects. Subpart I concerns advanced identification of disposal areas.

~~§ 230.5 General procedures to be followed.~~

In evaluating whether a particular discharge site may be specified, the permitting authority should use these Guidelines in the following sequence:

(a) In order to obtain an overview of the principal regulatory provisions of the Guidelines, review the restrictions on discharge in § 230.10(a)–(d), the measures to mimimize adverse impact of Subpart H, and the required factual determinations of § 230.11.

(b) Determine if a General permit (§ 230.7) is applicable; if so, the applicant needs merely to comply with its terms, and no further action by the permitting authority is necessary. Special conditions for evaluation of proposed General permits are contained in § 230.7. If the discharge is not covered by a General permit,

(c) Examine practicable alternatives to the proposed discharge, that is, not discharging into the waters of the U.S. or discharging into an alternative aquatic site with potentially less damaging consequences (§ 230.10(a)).

(d) Delineate the candidate disposal site consistent with the criteria and evaluations of § 230.11(f).

(e) Evaluate the various physical and chemical components which characterize the non-living environment of the candidate site, the substrate and the water including its dynamic characteristics (Subpart C).

(f) Identify and evaluate any special or critical characteristics of the candidate disposal site, and surrounding areas which might be affected by use of such site, related to their living communities or human uses (Subparts D, E, and F).

Guidelines should set "standards of performance" rather than step-by-step procedures. The approach given here severely restricts field discretion and opens many avenues of legal attack for procedural errors.

(g) Review Factual Determinations in § 230.11 to determine whether the information in the project file is sufficient to provide the documentation required by § 230.11 or to perform the pre-testing evaluation described in § 230.60, or other information is necessary.

(h) Evaluate the material to be discharged to determine the possibility of chemical contamination or physical incompatibility of the material to be discharged (§ 230.60).

(i) If there is a reasonable probability of chemical contamination, conduct the appropriate tests according to the section on Evaluation and Testing (§ 230.61).

(j) Identify appropriate and practicable changes to the project plan to minimize the environmental impact of the discharge, based upon the specialized methods of minimization of impacts in Subpart H.

(k) Make and document Factual Determinations in § 230.11.

(l) Make and document Findings of Compliance (§ 230.12) by comparing Factual Determinations with the requirements for discharge of § 230.10.

This outline of the steps to follow in using the Guidelines is simplified for purposes of illustration. The actual process followed may be iterative, with the results of one step leading to a reexamination of previous steps. The permitting authority must address all of the relevant provisions of the Guidelines in reaching a Finding of Compliance in an individual case.

SEE NOTE ON PREVIOUS PAGE

§ 230.6 Adaptability.

(a) The manner in which these Guidelines are used depends on the physical, biological, and chemical nature of the proposed extraction site, the material to be discharged, and the candidate disposal site, including any other important components of the ecosystem being evaluated. Documentation to demonstrate knowledge about the extraction site, materials to be extracted, and the candidate disposal site is an essential component of guideline application. These Guidelines allow evaluation and documentation for a variety of activities, ranging from those with large, complex impacts on the aquatic environment to those for which the impact is likely to be innocuous. It is unlikely that the Guidelines will apply in their entirety to any one activity, no matter how complex. It is anticipated that substantial numbers of permit applications will be for minor, routine activities that have little, if any, potential for significant degradation of the aquatic environment. It generally is not intended or expected that extensive testing, evaluation or analysis will be needed to make findings of compliance in such routine cases. Where the conditions for General permits are met, and where numerous applications for similar activities are likely, the use of General permits will eliminate repetitive evaluation and documentation for individual discharges.

EXTRANEOUS.

implementing the Guidelines, must recognize the different levels of effort that should be associated with varying degrees of impact and require or prepare commensurate documentation. The level of documentation should reflect the significance and complexity of the discharge activity.

(c) An essential part of the evaluation process involves making determinations as to the relevance of any portion(s) of the Guidelines and conducting further evaluation only as needed. However, where portions of the Guidelines review procedure are "short form" evaluations, there still must be sufficient information (including consideration of both individual and cumulative impacts) to support the decision of whether to specify the site for disposal of dredged or fill material and to support the decision to curtail or abbreviate the evaluation process. The presumption against the discharge in § 230.1 applies to this decision-making.

(d) In the case of activities covered by General permits or 208(b)(4)(B) and (C) Best Management Practices, the analysis and documentation required by the Guidelines will be performed at the time of General permit issuance or 208(b)(4)(B) and (C) Best Management Practices promulgation and will not be repeated when activities are conducted under a General permit or 208(b)(4)(B) and (C) Best Management Practices control. These Guidelines do not require reporting or formal written communication at the time individual activities are initiated under a General permit or 208(b)(4)(B) and (C) Best Management Practices. However, a particular General permit may require appropriate reporting.

§ 230.7 General permits.

~~(a) *Conditions for the issuance of General permits.* A General permit for a category of activities involving the discharge of dredged or fill material complies with the Guidelines if it meets the applicable restrictions on the discharge in § 230.10 and if the permitting authority determines that:~~

~~(1) The activities in such category are similar in nature and similar in their impact upon water quality and the aquatic environment;~~

~~(2) The activities in such category will have only minimal adverse effects when performed separately; and~~

~~(3) The activities in such category will have only minimal cumulative adverse effects on water quality and the aquatic environment.~~

~~(b) *Evaluation process.* To reach the determinations required in paragraph (a) of this section, the permitting authority~~

NOT RELATED TO "EFFECTS"

shall set forth in writing an evaluation of the potential individual and cumulative impacts of the category of activities to be regulated under the General permit. Some of the information necessary for this evaluation can be obtained from potential permittees and others through the proposal of General permits for public review. The evaluation must be completed before any General permit is issued, and the results must be published with the final permit.

Procedural / policy

(1) This evaluation shall be based upon consideration of the prohibitions listed in § 230.10(b) and the factors listed in § 230.10(c), and shall include documented information supporting each factual determination in § 230.11 of the Guidelines (consideration of alternatives in § 230.10(a) are not directly applicable to General permits).

NOT POSSIBLE TO DO EXPLICITLY.

(2) The evaluation shall include a precise description of the activities to be permitted under the General permit, explaining why they are sufficiently similar in nature and in environmental impact to warrant regulation under a single General permit based on Subparts C–F of the Guidelines. Allowable differences between activities which will be regulated under the same General permit shall be specified. Activities otherwise similar in nature may differ in environmental impact due to their location in or near ecologically sensitive areas, areas with unique chemical or physical characteristics, areas containing concentrations of toxic substances, or areas regulated for specific human uses or by specific land or water management plans (e.g., areas regulated under an approved Coastal Zone Management Plan). If there are specific geographic areas within the purview of a proposed General permit (called a draft General permit under a State 404 program), which are more appropriately regulated by individual permit due to the considerations cited in this paragraph, they shall be clearly delineated in the evaluation and excluded from the permit. In addition, the permitting authority may require an individual permit for any proposed activity under a General permit where the nature or location of the activity makes an individual permit more appropriate.

NOT RELATED TO "EFFECTS"

(3) To predict cumulative effects, the evaluation shall include the number of individual discharge activities likely to be regulated under a General permit until its expiration, including repetitions of individual discharge activities at a single location.

FAR TOO RESTRICTIVE

Subpart B—Compliance With the Guidelines

§ 230.10 Restrictions on discharge.

Note.—Because other laws may apply to particular discharges and because the Corps of Engineers or State 404 agency may have additional procedural and substantive requirements, a discharge complying with the requirement of these Guidelines will not automatically receive a permit.

Although all requirements in § 230.10 must be met, the compliance evaluation procedures will vary to reflect the seriousness of the potential for adverse impacts on the aquatic ecosystems posed by specific dredged or fill material discharge activities.

~~(a) Except as provided under~~ § 404(b)(2), no discharge of dredged or fill material shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences.

(1) For the purpose of this requirement, practicable alternatives include, but are not limited to:

(i) Activities which do not involve a discharge of dredged or fill material into the waters of the United States or ocean waters;

(ii) Discharges of dredged or fill material at other locations in waters of the United States or ocean waters;

(2) An alternative is practicable if it is available and capable of being done after taking into consideration cost, existing technology, and logistics in light of overall project purposes. If it is otherwise a practicable alternative, an area not presently owned by the applicant which could reasonably be obtained, utilized, expanded or managed in order to fulfill the basic purpose of the proposed activity may be considered.

(3) Where the activity associated with a discharge which is proposed for a special aquatic site (as defined in Subpart E) does not require access or proximity to or siting within the special aquatic site in question to fulfill its basic purpose (i.e., is not "water dependent"), practicable alternatives that do not involve special aquatic sites are presumed to be available, unless clearly demonstrated otherwise. In addition, where a discharge is proposed for a special aquatic site, all practicable alternatives to the proposed discharge which do not involve a discharge into a special aquatic site are presumed to have less adverse impact on the aquatic ecosystem, unless clearly demostrated ~~otherwise.~~

PRESUMPTIONS NOT REQUIRED BY STATUTE.

~~(4) For actions subject to NEPA, where the Corps of Engineers is the permitting agency, the analysis of alternatives required for NEPA environmental documents, including supplemental Corps NEPA documents, will in most cases provide the information for the evaluation of alternatives under these Guidelines. On occasion, these NEPA documents may address a broader range of alternatives than required to be considered under this paragraph or may not have considered the alternatives in sufficient detail to respond to the requirements of these Guidelines. In the latter case, it may be necessary to supplement these NEPA documents with this additional information.~~

SUCH A RIGOROUS EVALUATION OF ALTERNATIVE IS NOT REQUIRED BY STATUTE.

~~(5) To the extent that practicable alternatives have been identified and evaluated under a Coastal Zone Management program, a § 208 program, or other planning process, such evaluation shall be considered by the permitting authority as part of the consideration of alternatives under the Guidelines. Where such evaluation is less complete than that contemplated under this subsection, it must be supplemented accordingly.~~

(b) No discharge of dredged or fill material shall be permitted if it:

~~(1) Causes or contributes, after consideration of disposal site dilution and dispersion, to violations of any applicable State water quality standards;~~

COVERED BY 401 STATE CERTIFICATION

(2) Violates any applicable toxic effluent standard or prohibition under section 307 of the Act;

~~(3) Jeopardizes the continued existence of species listed as endangered or threatened under the Endangered Species Act of 1973, as amended, or results in likelihood of the destruction or adverse modification of a habitat which is determined by the Secretary of Interior or Commerce, as appropriate, to be a critical habitat under the Endangered Species Act of 1973, as amended. If an exemption has been granted by the Endangered Species Committee, the terms of such exemption shall apply in lieu of this subparagraph;~~

COVERED BY ENDANGERED SPECIES ACT PROCEDURES

~~(4) Violates any requirement imposed by the Secretary of Commerce to protect any marine sanctuary designated under Title III of the Marine Protection, Research, and Sanctuaries Act of 1972.~~

COVERED BY OCEAN DUMPING ACT PROCEDURES

~~(c) Except as provided under § 404(b)(2), no discharge of dredged or fill material shall be permitted which will cause or contribute to significant degradation of the waters of the United States. Findings of significant degradation related to the proposed discharge shall be based upon appropriate factual determinations, evaluations, and tests required by~~

NOT REQUIRED BY STATUTE.

~~Subparts B and G, after consideration of~~ Subparts C–F, with special emphasis on the persistence and permanence of the effects outlined in those subparts. Under these Guidelines, effects contributing to significant degradation considered individually or collectively, include:

(1) Significantly adverse effects of the discharge of pollutants on human health or welfare, including but not limited to effects on municipal water supplies, plankton, fish, shellfish, wildlife, and special aquatic sites.

(2) Significantly adverse effects of the discharge of pollutants on life stages of aquatic life and other wildlife dependent on aquatic ecosystems, including the transfer, concentration, and spread of pollutants or their byproducts outside of the disposal site through biological, physical, and chemical processes;

(3) Significantly adverse effects of the discharge of pollutants on aquatic ecosystem diversity, productivity, and stability. Such effects may include, but are not limited to, loss of fish and wildlife habitat or loss of the capacity of a wetland to assimilate nutrients, purify water, or reduce wave energy; or

(4) Significantly adverse effects of discharge of pollutants on recreational, aesthetic, and economic values.

(d) Except as provided under § 404(b)(2), no discharge of dredged or fill material shall be permitted unless appropriate and practicable steps have been taken which will minimize potential adverse impacts of the discharge on the aquatic ecosystem. ~~Subpart H identifies such possible steps.~~

LISTING THESE IN SUCH DETAIL PLACES AN UNNECESSARY DOCUMENTATION BURDEN ON THE APPLICANT AND THE CORPS AND IN THE VAST MAJORITY OF CASES IS NON-PRODUCTIVE.

§ 230.11 Factual determinations.

The permitting authority shall determine in writing the potential short-term or long-term effects of a proposed discharge of dredged or fill material on the physical, chemical, and biological components of the aquatic environment in light of Subparts C–F. Such factual determinations shall be used in § 230.12 in making findings of compliance or non-compliance with the restrictions on discharge in § 230.10. The evaluation and testing procedures described in § 230.60 and § 230.61 of Subpart G shall be used as necessary to make, and shall be described in, such determination. The determinations of effects of each proposed discharge shall include the following:

(a) *Physical substrate determinations.* Determine the nature and degree of effect that the proposed discharge will have, individually and cumulatively, on the characteristics of the substrate at the proposed disposal site. Consideration shall be given to the similarity in particle size, shape, and degree of compaction of the material

proposed for discharge and the material constituting the substrate at the disposal site, and any potential changes in substrate elevation and bottom contours, including changes outside of the disposal site which may occur as a result of erosion, slumpage, or other movement of the discharged material. The duration and physical extent of substrate changes shall also be considered. The possible loss of environmental values (§ 230.20) and actions to minimize impact (Subpart H) shall also be considered in making these determinations. Potential changes in substrate elevation and bottom contours shall be predicted on the basis of the proposed method, volume, location, and rate of discharge, as well as on the individual and combined effects of current patterns, water circulation, wind and wave action, and other physical factors that may affect the movement of the discharged material.

(b) *Water circulation, fluctuation, and salinity determinations.* Determine the nature and degree of effect that the proposed discharge will have individually and cumulatively on water, current patterns, circulation including downstream flows, and normal water fluctuation. Consideration shall be given to water chemistry, salinity, clarity, color, odor, taste, dissolved gas levels, temperature, nutrients, and eutrophication plus other appropriate characteristics. Consideration shall also be given to the potential diversion or obstruction of flow, alterations of bottom contours, or other significant changes in the hydrologic regime. Additional consideration of the possible loss of environmental values (§ 230.23–.25) and actions to minimize impacts (Subpart H), shall be used in making these determinations. Potential significant effects on the current patterns, water circulation, normal water fluctuation and salinity shall be evaluated on the basis of the proposed method, volume, location, and rate of discharge.

(c) *Suspended particulate/turbidity determinations.* Determine the nature and degree of effect that the proposed discharge will have, individually and cumulatively, in terms of potential changes in the kinds and concentrations of suspended particulate/turbidity in the vicinity of the disposal site. Consideration shall be given to the grain size of the material proposed for discharge, the shape and size of the plume of suspended particulates, the duration of the discharge and resulting plume and whether or not the potential changes will cause violations of applicable water quality standards.

Consideration should also be given to possible loss of environmental s (§ 230.21) and to actions for zing impacts (Subpart H). eration shall include the proposed method, volume, location, and rate of discharge, as well as the individual and combined effects of current patterns, water circulation and fluctuations, wind and wave action, and other physical factors on the movement of suspended particulates.

(d) *Contaminant determinations.* Determine the degree to which the material proposed for discharge will introduce, relocate, or increase contaminants. This determination shall consider the material to be discharged, the aquatic environment at the proposed disposal site, and the availability of contaminants.

(e) *Aquatic ecosystem and organism determinations.* Determine the nature and degree of effect that the proposed discharge will have, both individually and cumulatively, on the structure and function of the aquatic ecosystem and organisms. Consideration shall be given to the effect at the proposed disposal site of potential changes in substrate characteristics and elevation, water or substrate chemistry, nutrients, currents, circulation, fluctuation, and salinity, on the recolonization and existence of indigenous aquatic organisms or communities. Possible loss of environmental values (§ 230.31), and actions to minimize impacts (Subpart H) shall be examined. Tests as described in § 230.61 (Evaluation and Testing), may be required to provide information on the effect of the discharge material on communities or populations of organisms expected to be exposed to it.

(f) *Proposed disposal site determinations.* (1) Each disposal site shall be specified through the application of these Guidelines. The mixing zone shall be confined to the smallest practicable zone within each specified disposal site that is consistent with the type of dispersion determined to be appropriate by the application of these Guidelines. In a few special cases under unique environmental conditions, where there is adequate justification to show that widespread dispersion by natural means will result in no significantly adverse environmental effects, the discharged material may be intended to be spread naturally in a very thin layer over a large area of the substrate rather than be contained within the disposal site.

(2) The permitting authority and the Regional Administrator shall consider the following factors in determining the acceptability of a proposed mixing zone:

(i) Depth of water at the disposal site;

(ii) Current velocity, direction, and variability at the disposal site;

(iii) Degree of turbulence;

(iv) Stratification attributable to causes such as obstructions, salinity or density profiles at the disposal site;

(v) Discharge vessel speed and direction, if appropriate;

(vi) Rate of discharge;

(vii) Ambient concentration of constituents of interest;

(viii) Dredged material characteristics, particularly concentrations of constituents, amount of material, type of material (sand, silt, clay, etc.) and settling velocities;

(ix) Number of discharge actions per unit of time;

(x) Other factors of the disposal site that affect the rates and patterns of mixing.

(g) *Determination of cumulative effects on the aquatic ecosystem.* (1) Cumulative impacts are the changes in an aquatic ecosystem that are attributable to the collective effect of a number of individual discharges of dredged or fill material. Although the impact of a particular discharge may constitute a minor change in itself, the cumulative effect of numerous such piecemeal changes can result in a major impairment of the water resources and interfere with the productivity and water quality of existing aquatic ecosystems.

(2) Cumulative effects attributable to the discharge of dredged or fill material in waters of the United States should be predicted to the extent reasonable and practical. The permitting authority shall collect information and solicit information from other sources about the cumulative impacts on the aquatic ecosystem. This information shall be documented and considered during the decision-making process concerning the evaluation of individual permit applications, the issuance of a General permit, and monitoring and enforcement of existing permits.

(h) *Determination of secondary effects on the aquatic ecosystem.* (1) Secondary effects are effects on an aquatic ecosystem that are associated with a discharge of dredged or fill materials, but do not result from the actual placement of the dredged or fill material. Information about secondary effects on aquatic ecosystems shall be considered prior to the time final section 404 action is taken by permitting authorities.

(2) Some examples of secondary effects on an aquatic ecosystem are fluctuating water levels in an impoundment and downstream associated with the operation of a dam, septic tank leaching and surface runoff

from residential or commercial developments on fill, and leachate and runoff from a sanitary landfill located in waters of the U.S. Activities to be conducted on fast land created by the discharge of dredged or fill material in waters of the United States may have secondary impacts within those waters which should be considered in evaluating the impact of creating those fast lands.

§ 230.12 Findings of compliance or non-compliance with the restrictions on discharge.

(a) On the basis of these Guidelines (Subparts C through G) the proposed disposal sites for the discharge of dredged or fill material must be:

(1) Specified as complying with the requirements of these Guidelines; or

(2) Specified as complying with the requirements of these Guidelines with the inclusion of appropriate and practicable discharge conditions (see Subpart H) to minimize pollution or adverse effects to the affected aquatic ecosystems; or

(3) Specified as failing to comply with the requirements of these Guidelines where:

(i) There is a practicable alternative to the proposed discharge that would have less adverse effect on the aquatic ecosystem, so long as such alternative does not have other significant adverse environmental consequences; or

(ii) The proposed discharge will result in significant degradation of the aquatic ecosystem under § 230.10(b) or (c); or

(iii) The proposed discharge does not include all appropriate and practicable measures to minimize potential harm to the aquatic ecosystem; or

(iv) There does not exist sufficient information to make a reasonable judgment as to whether the proposed discharge will comply with these Guidelines.

(b) Findings under this section shall be set forth in writing by the permitting authority for each proposed discharge and made available to the permit applicant. These findings shall include the factual determinations required by § 230.11, and a brief explanation of any adaptation of these Guidelines to the activity under consideration. In the case of a General permit, such findings shall be prepared at the time of issuance of that permit rather than for each subsequent discharge under the authority of that permit.

Subpart C—Potential Impacts on Physical and Chemical Characteristics of the Aquatic Ecosystem

Note.—The effects described in this subpart should be considered in making the

DEPARTMENT OF THE ARMY
OFFICE OF THE ASSISTANT SECRETARY
WASHINGTON, DC 20310

December 17, 1982

The Vice President
The White House
Washington, D.C. 20501

Dear Mr. Vice President:

On May 7, 1982, the Presidential Task Force on Regulatory Relief directed a number of reforms to be made to the Army Corps of Engineers' regulatory programs under Section 404 of the Clean Water Act and Section 10 of the River and Harbor Act of 1899.

Executive Branch agencies were asked to implement these reforms within six months. Because that time has expired, in my capacity as Chairman of the Interagency Working Group charged with overseeing the reform effort, I am attaching a complete status report for your information.

Completion of your task to us awaits completion of a draft of the 404(b)(1) guidelines by the Environmental Protection Agency. These guidelines were promised first in November, then in December, then in January and now in February. In addition, the publication of our final regulations is being held up pending EPA concurrence to our new jurisdictional definition, or EPA's submission of an alternate proposal with which Army can agree. Efforts to get EPA to address these processes to meet your time schedules have not been successful.

I believe it is time for your personal involvement to bring this matter to a conclusion. We remain steadfastly committed to carrying out your charter of May 7, 1982, and securing responsible reforms for the Nation. Your staff has been of great assistance to us and we will continue to work very hard to resolve these issues. With your help, I am confident we can still succeed.

Sincerely,

Bill Gianelli

William R. Gianelli
Assistant Secretary of the Army
(Civil Works)

Attachment

Several other aspects of reform are contained in proposed regulations which Army has informally provided to OMB and coordinated with other affected agencies. The major points are greater authority to and reliance on the States, expanded emphasis on general permits, and clarification of the scope of Section 404 jurisdiction.

Publication of those regulations for public comment is awaiting EPA concurrence with the proposed clarification of the definition of jurisdiction. That concurrence is required by an Attorney General's decision made during the previous Administration. Although Army and EPA have had several lengthy discussion sessions among appointed agency officials and their career professional staffs, EPA has neither agreed with Army's proposal nor offered any suggestions for alternatives.

The one major aspect of reform on which little progress has been made is the shortening and simplification of the Section 404(b)(1) guidelines by EPA. EPA had promised action by November, then December, and is now saying February. Since the guidelines are required to be developed by EPA in conjunction with Army, in November Army provided EPA with an outline of principles upon which the guidelines should be based in order to be consistent with the Task Force directives and with draft guidelines which Army believes are reasonable and legally sufficient. EPA has not yet responded.

STATUS OF REFORMS TO THE ARMY CORPS OF ENGINEERS REGULATORY PROGRAMS UNDER SECTION 404 OF THE CLEAN WATER ACT AND SECTION 10 OF THE RIVER AND HARBOR ACT OF 1899

All the points raised in the May 7, 1982 decisions of the Presidential Task Force on Regulatory Relief which could be implemented without rule-making have been accomplished. The Corps of Engineers has instituted administrative reforms to reach decisions on permit applications within 60 days. In the fourth quarter of FY 1982, final actions were taken within 60 days on 45% of the permit applications, up from 36% in the third quarter. We expect continued improvement in the coming months.

New Memoranda of Agreement between Army and the Departments of Interior, Commerce, Agriculture and Transportation and the Environmental Protection Agency have been reached to expedite the review process and to reduce duplication of effort. The Agreements have worked well with one exception. Army and Interior are still experiencing difficulties and are working hard to overcome them. If after several months the problems are not corrected - the number of "intent to elevate" cases is still too high and the coordination opportunities provided the 60 day decision target is still at issue - it may be necessary to revise the new agreements.

Revisions to the Corps' NEPA and cultural resources regulations took a back seat for a time due to much greater than expected coordination problems on some more critical aspects of the reforms. The NEPA regulations are now well along the internal draft stage, and we have discussed them generally with Alan Hill of CEQ. We expect to have proposed regulations to OMB in January. We are participating with the Advisory Council on Historic Preservation and other agencies in an interagency working group to revise the ACHP regulations. We have deferred our own counterpart implementation regulations pending results of that interagency effort.

DEPARTMENT OF THE ARMY
OFFICE OF THE ASSISTANT SECRETARY
WASHINGTON, DC 20310

March 23, 1983

The Vice President
The White House
Washington, D. C. 20500

Dear Mr. Vice President:

In the one and one-half years since the Section 404 Clean Water Act regulatory program was designated as part of this Administration's regulatory reform effort, we have accomplished many significant reforms, all without diminishing in any way compliance with environmental protection requirements.

The major administrative measure which remains is the reform of the guidelines under Section 404(b)(1) required to be developed by the Administrator of the Environmental Protection Agency in conjunction with the Secretary of the Army. These guidelines must be applied to each of the approximately 20,000 permits processed annually and are a major source of delay, duplication and uncertainty. The Army and EPA have reached an impasse on reforming those guidelines which must be resolved before we proceed with completion of the reform effort.

The primary remaining issue relates to what the nature of the guidelines is and who is in charge of and responsible for the program. The Army feels strongly that the guidelines should return to advisory status, a standing which would still accord them great weight in the process, whereas EPA feels the guidelines must be regulatory criteria. Congress charged the Corps of Engineers with responsibility for administering the program. In order to manage the program in the most effective and responsible manner and to implement fully the reforms directed by the Presidential Task Force on Regulatory Relief, the Corps must be able to balance all factors of concern to the public in reaching decisions under the program. This is consistent with the National Environmental Policy Act and with Executive Order 12291, both of which require a balanced approach to Federal decision making.

The Corps cannot reach a balanced decision properly reflecting the full range of public concerns if a permit applicant is required by regulations to comply with non-statutory criteria before the Corps can consider any other

issues. Guidelines of an advisory nature will work well to aid the Corps in determining impacts on water quality and related environmental issues when reaching a balanced decision. However, guidelines which are regulatory in nature and written by EPA, which is not responsible for administering the program, will inevitably give rise to duplication, overlap and conflict with the responsible agency's rules established under other related statutes. Such regulatory guidelines also severely inhibit the agency's ability to adapt the program regionally and in individual cases to best serve the interests of the public. In addition, regulations transform this aspect of the permit process from an internal evaluation procedure to one which creates an unnecessary third party litigation opportunity with its attendant encumbrance on the system.

In the initial version, published in September 1975, the guidelines were advisory in nature. They remained that way until the final days of the last administration, December 24, 1980, when they were changed to regulatory criteria. The revised guidelines introduced policies and procedures which overlap and conflict with regulations of the Corps of Engineers and Council on Environmental Quality in the area of alternative analysis, consideration of economic and social factors and several other important concepts. In our judgment, this runs directly counter to the decisions of the Presidential Task Force and to sound government management principles.

As long as the guidelines remain as regulatory criteria, Army will be unable to implement fully the Task Force decisions and will be unable to attain optimum management efficiency. The Corps has demonstrated over the years a high degree of environmental responsibility under the initial advisory guidelines and under NEPA and various other environmental laws. There was not and is not now any justification for imposing the additional staff burdens necessary to ensure legal compliance with regulatory criteria. The quality of decisions and hence the quality of the environment have not been enhanced by such legalistic requirements but staff efforts have certainly been dissipated.

There are several additional points of importance to this issue. First, EPA has a statutory veto under Section 404(c). We believe this is the mechanism through which Congress intended EPA to oversee actions of the Corps of Engineers to ensure that decisions meet environmental standards.

Second, Army General Counsel has analyzed the statute and believes there is no legal requirement that the guidelines be regulatory. In fact, he believes the legal analysis supports a conclusion that they should be advisory as they were in the past. The Department of Justice believes that a sound legal argument can be made to support advisory guidelines. We are confident of the soundness of the legal arguments in support of our position and will be glad to respond in detail to any legal assertions to the contrary.

There are several other important issues outstanding. However, we would expect that Army and EPA, with the assistance if necessary of the Task Force, can resolve those without imposing on your personal attention once this issue is settled.

Given the substantial and lasting management and program efficiencies to be gained and better responsiveness to the public interest, including the absence of any diminution at all in compliance with environmental protection statutes, Army recommends that the Administration adopt the position that the guidelines are advisory in nature and that decisions under the program should reflect the full range of public concerns as provided for in existing Corps of Engineers regulations.

Dr. John Hernandez and I have discussed this issue at length and stand ready to assist you in any way in reaching a solution.

Sincerely,

Bill Gianelli

William R. Gianelli
Assistant Secretary of the Army
(Civil Works)

DEPARTMENT OF THE ARMY
OFFICE OF THE ASSISTANT SECRETARY
WASHINGTON, DC 20310

The Vice President
The White House
Washington, D. C. 20500

Dear Mr. Vice President:

I am pleased to report some significant progress in the reform of the Corps of Engineers Regulatory programs under Section 10 of the River and Harbor Act of 1899 and Section 404 of the Clean Water Act.

On May 7, 1982, the Presidential Task Force on Regulatory Relief issued directives for reforming the Corps' program. As a result of implementing reform measures, the average time required to process an individual permit has been reduced from 142 days to 82 days and the backlog of applications pending decision has been reduced from 7500 to 4300. In addition, we have established as a goal that all applications be processed within 60 days. Since the reform effort began, the percentage of individual applications processed within 60 days nearly doubled from 33% to 59%.

A most significant feature related to these statistics is that there has been no reduction in any of the environmental protections afforded by the program. At the outset of the reform effort, many people speculated that the reform measures would have adverse environmental impacts. Now, after more than a year of experience with our reforms, these fears have not been realized. In fact, we expect, as we have always expected, that the reforms will provide even better environmental protections by allowing the Corps to concentrate limited staff resources on the truly significant issues and not waste them on non-productive bureaucratic red tape.

I would add the caution that much remains to be done. For example, directives of the Task Force which have not been completed include shortening and simplifying the guidelines developed by the Environmental Protection Agency under Section 404(b)(1), clarifying the scope of jurisdiction, and revising related regulations such as those issued pursuant to the National Environmental Policy Act and the National Historic Preservation Act. We are continuing to work diligently towards those goals.

I appreciate your leadership and support throughout this important endeavor. Some of the President's goals in this area have been achieved and with your continued support, I am certain we will achieve all the goals that the Presidential Task Force set for us. I must point out that, while we should take pride in the accomplishments to date, we should make certain that our reforms are not short-lived and easily reversed. The way to accomplish this, in our view, is to fully implement the May 7, 1982, charter.

Sincerely,

(Signed)

William R. Gianelli
Assistant Secretary of the Army
(Civil Works)

APPENDIX VI

What H.R. 1570 Would Do

The environmental impacts of H.R. 1570 would be far-reaching. If enacted, H.R. 1570 would:

1) Restrict the definition of "navigable waters," for the purposes of Section 404, to waters which are presently used, or are susceptible to use in their natural condition or by reasonable improvements as a means to transport interstate or foreign commerce;

2) Exclude all discharges of dredged or fill material into waters and wetlands not covered by this new definition from prohibition or regulation under Section 404 of the Clean Water Act ("CWA"), or Sections 9, 10, or 13 of the 1899 Rivers and Harbors Act ("RHA");

3) Shift the burden of demonstrating compliance with the Section 404(b) guidelines from applicants to the U.S. Army Corps of Engineers ("COE");

4) Weaken the ability of Section 404 to protect even the navigable waters by allowing the COE to consider factors other than the Section 404(b) environmental guidelines when judging the merits of a dredge or fill activity;

5) Repeal the optional State Permit Programs currently authorized under Section 404; and

6) Eliminate the application of all federal laws to the discharge of dredged or fill material into non-navigable waters.

Restricting the Definition of "Navigable Waters"

H.R. 1570 raises the fundamental question of whether the CWA will continue to control water pollution or will be reduced to a navigation law. Six years ago bills and amendments almost identical to H.R. 1570 were introduced to restrict Section 404 to the "navigable waters." They did not pass. Instead, more moderate, reasoned, and carefully circumscribed amendments to Section 404 were enacted in 1977 that retained the broad jurisdictional scope of Section 404 over "all waters of the U.S."[1/] In refusing to reduce the jurisdictional scope of the Section 404 program, Congress reaffirmed its intention to protect this Nation's wetlands through Section 404:

> "Without it [Section 404], critical aquatic areas including swamps, marshes and submerged grass flats, which are an important segment of this Nation's water resources and are essential to the preservation of migratory and resident fish, birds, and other animal populations, might otherwise be irrevocably destroyed.
>
> "The Section 404 program as outlined in the committee bill will be a successful and reasonable process for protecting inland and coastal waters, including wetlands, from adverse environmental effects resulting from the discharge of dredged or fill material."
>
> Legislative History of the Clean Water Act of 1977, at 413.

1/ To eliminate concerns about overregulation Congress exempted farmers, foresters, and ranchers, authorized the issuance of general permits, and provided for state takeover of Section 404 for the non-navigable waters.

The importance of regulating the destruction of wetlands through Section 404 was recognized at that time:

> "There is no question that the systematic destruction of the Nation's wetlands is causing serious, permanent ecological damage. The wetlands and bays, estuaries and deltas are the Nation's most biologically active areas. They represent a principal source of food supply. They are spawning grounds for much of the fish and shellfish which populate the oceans and they are passages for numerous upland game fish. They also provide nesting areas for a myriad of species of birds and wildlife.
>
> "The unregulated destruction of these areas is a matter which needs to be corrected and which implementation of Section 404 has attempted to achieve."
>
> Legislative History of the Clean Water Act of 1977 at 869 (Committee Print 1978).

Notwithstanding the events of 1976 and 1977, opponents of Section 404 continue to claim that the courts and the agencies have expanded the jurisdictional scope of the program far beyond what Congress intended by including wetlands and non-navigable waters. Those arguments should have been put to rest since Congress specifically addressed the jurisdictional scope of Section 404 in 1976 and 1977.

H.R. 1570 would have a serious impact on the chemical, biological, and physical integrity of all the Nation's waters, including the navigable waters. It would remove from federal protection under Section 404 85% of the Nation's wetlands, or 126 million of the 148 million acres currently covered, and thousands of miles of river and lake shoreline. A few examples of exempted wetlands include:

- Ninety percent of the remaining 5 million acres of bottomland hardwoods in the lower Mississippi Valley;

- All of the 2 to 2.3 million acres of prairie potholes in North Dakota;
- Over 1,259,000 of freshwater wetlands in New York;
- Almost 670,000 acres of undisturbed pocosin wetlands in North Carolina;
- The white cedar swamps in the New Jersey pine barrens;
- The Great Dismal Swamp in Virginia;
- Large portions of Florida's Everglades;
- The riparian wetlands and intermittent streams of the West; and
- Much of Alaska's tundra.

It would also prevent the federal government from regulating the discharge of contaminated dredge or fill material into non-navigable tributaries and wetlands under Section 404. Because waters are ecologically and hydrologically interrelated, contaminated dredge and fill materials containing PCB's, arsenic, kepone, DDT, mercury, and other contaminants that are discharged into non-navigable waters or wetlands will find their way into the navigable waters as well. Whether discharged into non-navigable or navigable waters, these contaminants will adversely affect water quality, pose serious human health risks, and harm fish and wildlife resources.

Furthermore, the destruction of wetlands at the headwaters of our navigable and non-navigable rivers, streams, and tributaries would alter the quality and timing of water flows into the navigable waters, and thus would adversely modify the physical and biological integrity of the navigable waters. Yet this destruction would be exempt from federal control under H.R. 1570.

In 1976 and 1977, Congress refused to restrict the federal government's pollution control authority to the navigable waters precisely because of the ecological interdependence of our waters:

> The objective of the 1972 act is to protect the physical, chemical, and biological integrity of the Nation's waters. Restriction of jurisdiction to those relatively few waterways that are used or are susceptible to use for navigation would render this purpose impossible to achieve. Discharges of dredged or fill material into lakes and tributaries of those waters can physically disrupt the chemical and biological integrity of the Nation's waters and adversely affect their quality. The presence of toxic pollutants in these materials compounds this pollution problem and further dictates that the adverse effects of such materials must be addressed where the material is first discharged into the Nation's waters. To limit the jurisdiction of the Federal Water Pollution Control Act with reference to discharges of the pollutants of dredged or fill material would cripple efforts to achieve the act's objectives.
>
> Legislative History of the Clean Water Act of 1977, at 708 (Committee Print).

That ecological interdependence continues today.

The impact of H.R. 1570 is not limited to Section 404. It would also exempt many waters and activities that are regulated under the 1899 Rivers and Harbors Act ("RHA"). Since at least 1921, all waters which had ever served as waters of commerce in the past--the so-called test of historic navigability--have been considered navigable waters and regulated under the RHA. (See, Economy Light and Power Co. v. United States, 256 U.S. 113 (1921).)[2/]

2/ It is estimated that 518,000 miles of river and 37,000 miles of lake shoreline are historically navigable or susceptible to navigation. Most of these rivers and lakes fall within the "historically navigable" category.

H.R. 1570 would also exempt from the RHA activities on non-navigable waters that would adversely impact navigable waters. Currently, the federal government can regulate activities beyond the limits of navigability if these activities adversely affect the navigable waters. (United States v. Rio Grande Irrigation Co., 174 U.S. 690 (1899).) In light of these restrictions, H.R. 1570 would eliminate the general ability of the United States to protect its public waters under the RHA, and set our pollution control efforts back to the last century.

Shifting the Burden of Compliance

We are concerned that H.R. 1570 would shift the burden of compliance under Section 404. Currently the applicant carries the burden of demonstrating that a dredge or fill activity complies with the Section 404(b) environmental guidelines. H.R. 1570 would shift that burden to COE by requiring permit issuance unless COE can demonstrate non-compliance with the guidelines. This shifting burden would increase COE workload and could in turn slow down permit processing in direct conflict with the stated purpose of H.R. 1570.

Eliminating Control Over Discharges in Non-Navigable Waters

H.R. 1570, by eliminating control over dredged or fill activities in non-navigable waters "notwithstanding any other provision of law" prevents the regulation of dredged or fill activities under other laws including the Endangered Species Act,

Marine Mammal Protection Act, Fish and Wildlife Coordination Act, and Bald and Golden Eagle Protection Act. This applies to private individuals and federal agencies. The consequences of this provision are serious and far-reaching.

Allowing COE to Consider Factors Other Than the Section 404(b) Environmental Guidelines

Currently a Section 404 permit cannot be issued unless issuance would comply with the Section 404(b) guidelines. The 404(b) guidelines establish criteria that protect fish, shellfish, wildlife, human health, and the physical, biological and chemical integrity and productivity of the Nation's waters. H.R. 1570 authorizes COE to issue permits based on "other considerations." This provision gives COE the unbridled discretion to issue permits regardless of the environmental impacts.

BEFORE THE

SUBCOMMITTEE ON WATER RESOURCES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

UNITED STATES HOUSE OF REPRESENTATIVES

November 9, 1983

STATEMENT OF WILLIAM Y. BROWN

ENVIRONMENTAL DEFENSE FUND

NATIONAL AUDUBON SOCIETY

Mr. Chairman and Members of the Subcommittee:

It is a pleasure to appear before you today and to present testimony on Section 404 of the Clean Water Act, the foremost existing authority for protecting wetlands of the United States.

The Environmental Defense Fund, Inc. ("EDF") and the National Audubon Society support the amendments to Section 404 contained in Section 10 of H.R. 3282, introduced by Mr. Howard, and the additional amendments contained in legislation being introduced by Mr. Mrazek. We applaud the initiative and foresight exercised by Mr. Howard and Mr. Mrazek by introducing these bills, and we look forward to support for the bills from the Chairman and Members of this Subcommittee. If enacted, these amendments will set back on course a program that has been under siege by the Department of the Army since 1981.

THE RECORD AND REMEDIES

Government by "Horror Stories"

On August 10, 1981, Assistant Secretary of the Army (Civil Works) William R. Gianelli gave the keynote address entitled "The Challenge Ahead" at a meeting sponsored by the American Society of Civil Engineers. At that meeting, Mr. Gianelli stated that the Section 404 regulations and agency administration of the process were "sorely in need" of reform and that "we have begun that process."

The October, 1981, edition of The Coordinator, an official publication of the U.S. Army Corps of Engineers, reprinted portions of Mr. Gianelli's speech immediately before the following headline and story:

> URGENT NEED FOR HORROR STORIES CONTINUES
>
> A slight improvement in the flow of Section 404 HORROR STORIES (concerning review delays and jurisdictional determinations) to Water Resources Congress was recorded during August. Thus far Texas, Ohio, Alabama, Louisiana, and Colorado have contributed. But legislative relief is a long way down the road with only five states reporting. We must have more tales of woe conncected with 404 if an adequate record is to be compiled.
>
> The preceding article is reprinted from the Washington Report, the Water Resources Congress newsletter issue for September 1981.

The well of Section 404 horror stories proved dry, however; instead the Army was flooded with evidence of success.

The Right Stuff

In November, 1981, the Institute for Water Resources of the Army Corps of Engineers submitted a regulatory impact analysis ("RIA") of the Corps' permit program to the Office of the Chief of Engineers. The RIA (235 pages plus appendices) was prepared to meet the requirements of President Reagan's Executive Order on Federal Regulation (E.O.12291).

The RIA assessed and summarized key elements of the Section 404 program:

- about 148 million acres of wetlands in the United States are within the program's jurisidiction. These wetlands are found in every state and include many different kinds of ecosystems, such as saltwater and freshwater marshes, swamps, bogs, bottomland hardwoods, prairie potholes, and much arctic tundra.

- roughly half of the original wetlands in the contiguous 48 states have been destroyed.

- the Section 404 program has cut wetlands destruction roughly in half in the lower 48 states, reducing loss by more than 300,000 acres per year.

- the Corps of Engineers processes some 9,700 individual Section 404 permit applications annually: 49 percent are approved without modifications, 33 percent are approved with modifications and 16 percent of the applications are withdrawn before a decision is made. Only 2 percent of the applications are denied.

- the cost of complying with Section 404 averages less than one percent of total project value.

- the Section 404 program as in operation when the RIA was prepared "results in a net positive benefit to the Nation."

The RIA was quickly abandoned by the Army. Rather than uncovering horror, the RIA revealed sound operation of an

important federal program. The next step in "reform" of the program would have to go light on the facts.

Presidential Announcements

On May 7, 1982, the Presidential Task Force on Regulatory Relief announced "reforms" to the Section 404 program. These reforms were spearheaded by the Department of the Army. Detailed changes were specified for the memoranda of agreement (hereafter "M.O.A.'s") between the Corps and other agencies, most importantly the Environmental Protection Agency ("EPA"), Fish and Wildlife Service ("FWS"), and the National Marine Fisheries Service ("NMFS"). Other major May 7th "reforms" included mandates to expand the use of general permits, to "clarify" the scope of the permit program, and to change the Section 404(b)(1) guidelines.

The M.O.A.'s were revised early in July, 1982, essentialy eliminating the opportunity for careful interagency review and elevation of permit decisions at the request of the FWS, the NMFS, or EPA. Previously, elevation was automatic if a regional administrator or director of these agencies requested elevation within a 30-day comment period. The presidential announcements required the revised M.O.A.'s to provide only 15 days for these agencies to review applications and to request elevation. Requests for elevation now only can be made by the Assistant Secretary of Interior for Fish and Wildlife and Parks, the Administrator of the National Oceanic and

Atmospheric Administration or the Administrator or Deputy Administrator of EPA. Finally, such requests can be granted or denied at the discretion of the Assistant Secretary of the Army for Civil Works--currently Mr. Gianelli. This "Gianelli veto" was adopted over the objection of all other agencies participating in the administration of the Section 404 program--the EPA, the FWS and the NMFS.

Elevation was rarely invoked under the old M.O.A.'s--less than 1 percent of applications were elevated to the first level of review and only a fraction of these made it to the second level. The authority to elevate of the EPA, FWS, or NMFS regional administrator or director was an important factor in making Corps district engineers responsive to recommendations of these agencies on lessening environmental harm. The obstacles now in the path of elevation discourage adoption of resource agency recommendations, and we do not expect to see the situation improved during this Administration without action by the Congress. The Presidential Task Force limitations on interagency review would be overturned and replaced with a reasonable substitute by the amendment to Section 404(q) contained in Section 10 of Mr. Howard's Clean Water bill. We urge you to adopt that amendment.

Corps' Regulations Weakened

On July 22, 1982, the Corps issued new regulations for its permit program. The principal changes made by the regulations

were the issuance of new and revised nationwide, general permits. Twenty-five nationwide permits were issued or reissued for particular categories of activities. The regulations also extended and revised nationwide permits for discharges into non-tidal rivers, streams and lakes above the headwaters (5 c.f.s. flow rate) and into isolated non-tidal waters. These permits were revised to drop the requirement that lakes 10 acres or greater in size must be subject to individual permit application review.

We believe that the Corps has issued some, if not most, of these general permits in violation of the law. The general permits for discharges above the headwaters and into isolated waters are environmental disasters. Furthermore, the mischief in the July 22, 1982, Corps regulations is not limited to general permits. For example, Section 404 permits commonly have been issued subject to conditions that reduce or mitigate environmental impact. These conditions often cost the applicant little or nothing and not infrequently reduce cost. Such conditions are usually the heart of recommendations from the EPA, FWS, or NMFS. However, the July 22, 1982, regulations apparently prohibit Corps engineers from requiring modification of proposals or from conditioning permits if there are any "local, state or other Federal programs or policies to achieve the objective of the desired condition . . . " 33 C.F.R. §325.4(c)(1). Does this mean, for example, that a Section 404

permit cannot be conditioned to mitigate damage to wetlands merely because state and federal agencies may have other, perhaps ineffective, programs for the acquisition and protection of wetlands? Whatever the answer to this or other questions, this regulation is of dubious legality and muddies the responsibilities of the Corps. The regulation will tend to force Corps engineers to evaluate applications on an ill-advised "all-or-nothing" basis, as likely to injure the interests of applicants as to injure the interests of natural resource conservation.

The July 22, 1982, Corps regulations are sufficiently egregious that the Environmental Defense Fund, National Wildlife Federation, National Audubon Society, and 13 other conservation organizations have filed suit challenging them. Even as we focussed our resources to redress the Corps' assualt on its own regulations, however, the EPA began its own gambit.

EPA Begins The Reformation Waltz

On August 23, 1982, the EPA issued an advance notice of proposed rulemaking for its Section 404(b)(1) guidelines. 47 Fed. Reg. 36796. EPA had little choice; the May 7, 1982, Presidential Task Force announcments state that "[t]he EPA Section 404(b)(1) guidelines will be shortened, simplified, and made consistent with the reform measures described herein."

On March 7, 1983, EPA followed-up its advance notice by submitting draft proposed Section 404(b)(1) guidelines to the

Office of Management and Budget, requesting approval for publication in the Federal Register. Among other unfortunate revisions, the draft guidelines would have deleted the existing guideline requirement that "no discharge shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences." 40 C.F.R. §230.10(a). This requirement is the heart of the EPA guidelines, particularly insofar as such environmentally preferable, practicable alternatives are presumed to occur if a proposed discharge activity would occur in a wetland and is not "water dependent" (e.g. a marina is water dependent; a shopping mall is not). The draft EPA guidelines ran out of gas when Anne Burford was replaced by William Ruckelshaus as Administrator of the EPA, and we do not know what formulation of the guidelines eventually will debut in the Federal Register. It is a matter of record that the Army has not been happy with the March 7th draft, considering it too restrictive. Given these circumstances, we are extremely pleased to see the amendment to Section 404(b) that is contained is Section 10 of Mr. Howard's bill. That amendment would make the existing practicable alternative requirement a mandate of Congress. Assuming that the water dependency test is incorporated as part of this requirement, the amendment would ensure that the EPA will not

unleash the Corps from its proper duty in protecting wetlands. The need for a strong leash--perhaps a chain--was demonstrated once again just days after EPA's draft guidelines went to OMB.

Covert Army Legislation Endorsed by Cabinet Council

On March 25, 1983, the New York Times reported that President Reagan's Council on Environment is "letting the Army Corps of Engineers seek major changes in wetlands law while the Administration is officially seeking only minor changes . . . " The Times reported that, according to a memorandum prepared by a meeting participant, the Corps had been authorized "to write its own proposals and to go to a 'friend' in Congress who would shepherd the bill." The Army did prepare such legislation and reportedly met with several trade associations. Fortunately for wetlands, Mr. Howard, Mr. Mrazek, and other elected officials have proven more discriminating in their choice of legislative animals to shepherd.

Confusion and Excess in May

On May 12, 1983, the Corps proposed amendments to its July 22, 1982, permit regulations that would turn bad to worse.[1]

---

1. The following discussion on permit issuance criteria and an analysis of other aspects of the May 12 proposals are published in the National Wetlands Newsletter, July-Aug. 1983, Vol. 5, No. 4, pp. 7-9, W.Y. Brown.

20-955 O—84——133

Among these are proposed changes in issuance criteria for permits that would subordinate environmental factors, elevate economics in permit application review, and further obscure the relationship between the "public interest review" and the requirements of EPA's Section 404(b)(1) guidelines.

The current Corps regulations in Section 323.6(a) state: "Applications for permits for the discharge of dredged or fill material into the waters of the United States will be reviewed in accordance with" the EPA guidelines. This section was promulgated on July 22, 1982; the preamble to the regulations states: "The guidelines and the public interest review go hand-in-hand. Once all aspects of the public interest have been considered, <u>if a project does not conform to the guidelines, the permit would be denied.</u>" [emphasis added]. The EPA guidelines are thus presented as a threshhold test although, uneconomically, permit applications are to be measured against that threshhold only <u>after</u> they have been assessed against the many dimensions of the labyrinthine public interest review.

The May 12th proposals would not amend Section 323.6(a). Instead, the proposal would release an untried herd of Minotaurs into the public interest review and, little doubt, would sacrifice wetlands before them despite the supposedly unchanged protection of the EPA guidelines.

Among several new creatures in the public interest review is Section 320.4(j)(2), which states that the district engineer will "normally accept" decisions of "state, local and tribal governments" on matters such as "zoning and land use" unless there are "significant issues of overriding national importance" such as "national security, navigation, national economic development, water quality, and national energy needs." Water quality is the only environmental factor recognized as nationally significant. Section 325.2(a)(6) of the May 12th proposals would enforce this provision by requiring the district engineer either to refrain from decisions contrary to state or local decisions or to "document" the "significant national issues and explain how they are overriding in importance." This requirement applies to Section 404 as well as to other Corps permits. A district engineer can simultaneously be required to deny and approve a permit application: an application to convert wetlands may fail to meet requirements of the EPA guidelines but conform with a use approved by a state or local government and present no issues meeting the Corps' terms for overriding importance. In this paradox, the wetlands at stake may be lost.

Another curious beast is Section 320.4(q) entitled, simply, "Economics." That section states: "When private enterprise makes application for a permit, it will generally be assumed that appropriate economic evaluations have been completed and,

therefore, the proposal is economically viable and there is a need for it in the marketplace." [emphasis added]. "Economics" is really a marvel. Who is that devilish prescient fellow "private enterprise" anyway? Are we to assume, because they are common ends of private enterprise, that default and bankruptcy are needed in the market place? Although ridicule may be the best response to Section 320.4(q), the May 12th proposals and the mentality they reflect are simply tragic.

Besides reemphasizing the need for Congress to end the debate on permit issuance criteria by legislating the current EPA guideline standards, the May 12th Corps proposals illustrate the need for another amendment to Section 404 that we understand Mr. Mrazek is introducing. The EPA has filed detailed comments on the May 12th Corps proposals, including objections on environmental grounds to several nationwide general permits. However, the EPA has declined now, and often before, to use the authority given to it under Section 404(c) to halt these permits in their tracks. The time has come to stop EPA from giving lip service to environmental concerns while, in effect, condoning the environmental degradation to which EPA objects. Mr. Mrazeks's Section 404(c) amendment would do just that: EPA would be required to stop discharges if they would have unacceptable adverse environmental impacts. EPA also would be required to review petitions for exercise of Section 404(c) authority and, if such petitions provide

substantial information that the action called for is warranted, the EPA would be required to decide whether or not to implement the petitioned action.

Mr. Mrazek is also introducing another amendment to Section 505 of the Clean Water Act--the citizens suit provision--that we urge you to adopt. His amendment would simply insert the Secretary of the Army into Section 505 whereever the Administrator of EPA now appears. Omission of the Secretary apparently was no more than an oversight in drafting; we know of no reason considered for treating the Secretary any differently than the Administrator in this matter. If anything, the record of actions by the Army indicates a greater need for judicial review. Section 505 limits as well as facilitates such review, but overall Mr. Mrazek's amendment would make it simpler to take the Corps to court on Section 505 and that would be a good thing.

CONCLUSION

We support and urge this committee to approve a Clean Water Act bill that adopts the amendments to Sections 404(b) and 404(q) that are contained in Section 10 of Mr. Howard's bill, H.R. 3282, as well as the amendments to Sections 404(b), 404(c), and 505 that are being offered by Mr. Mrazek. Nearly one-half million acres of wetlands are lost each year, a large share from dredge and fill activities. Wetlands are integral to preservation of the physical, chemical, and biological

integrity of our nation's waters. That preservation is the objective of the Clean Water Act, and the specific province of Section 404. The time as come for the Congress to reinstruct the Corps on these fundamentals.

STATEMENT OF WES HAYDEN, LEGISLATIVE COUNSEL, INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES, FOR HEARING BY HOUSE PUBLIC WORKS AND TRANSPORTATION SUBCOMMITTEE ON WATER RESOURCES ON HR 3282, AMENDING THE FEDERAL WATER POLLUTION CONTROL ACT.

Nov. 9, 1983

Mr. Chairman: Speaking for the International Association of Fish and Wildlife Agencies, I appreciate the opportunity you are affording for presentation of the organization's views on the legislation you are considering here today.

As a preface to my comments, meanwhile, a word about our make-up and mission may contribute to your understanding of our interest in the measure and the position we are taking with respect to it.

The Association can trace its origin back to the time and philosophy of Teddy Roosevelt and has been, since its formulation in 1907 and its evolvement through a succession of name changes up to the present, committed fully to the cause of sound and balanced resource conservation, management and development.

Our membership now includes fish and game agencies in each of the 50 states and Puerto Rico, as well as federal and provincial organizations involved in related activities in the United States, Canada and Mexico and has just been expanded to take in an agency in Costa Rica.

With such a constituency, we have a clear and important stake in the issue now before you and it is in that context that we commend and support the proposals outlined in HR 3282 for addressing the clean water problem--particularly those designed for preservation of an effective Section 404 dredge and fill control program.

We applaud the positive approach you have undertaken to that aspect of the issue in conception of this legislation--all the more so because it offers such a contrast to other efforts to weaken the program through regulatory and administrative changes.

Those efforts could, if successful, have a devastating impact on this organization's primary objectives and those of others in the resource conservation and management community. They would, in our considered judgment, have the potential for greatly increasing the rate of loss of irreplaceable wetlands so essential for wildlife habitat and, in addition, result in

quality degradation of the nation's waters in areas where shortcuts in review procedures may result in inadequate developmental controls.

In recognition of those possible consequences, the International has been using its resources and influence over the past 20 months in a concerted effort to counter the threat which we perceive in the proposals of the Department of the Army for reshaping of the 404 program.

In our opinion, both as initially outlined and in subsequent formal proposals for regulatory changes, they go well beyond the intent of the President's Task Force for Regulatory Relief and totally ignore provisions for balance between economic and environmental needs and interests which Congress had made in setting up the 404 program.

For that reason we find it heartening that amendments proposed in HR 3282 touch directly on those points.

Section 10 (a) of the bill re-asserts a fundamental standard for environmental protection by barring use of a disposal site unless it is determined that dredge and fill material can be deposited there without unacceptable adverse effects and that there is, in addition, no other suitable alternative.

Significantly, that is among the current EPA 404 (b) (1) guidelines which Army now seeks to have revised or dropped.

Similarly, the amendment to Section 404 (q) which HR 3282 proposes would insure that federal agencies have sufficient time to evaluate controversial permits and removes the authority of the Secretary of the Army for Civil Works to veto permit referral requests by those agencies.

We have been deeply concerned by the extent to which those rights are restricted under current Army proposals and under new Memoranda of Understanding worked out between the Corps of Engineers, EPA, National Marine Fisheries Service and U.S. Fish and Wildlife Service as part of the Army's 404 program revision plan.

You may want to know that both of those points were touched on in IAFWA position statements developed at various points in our continuing effort to force some modification of Army recommendations.

The 404 (q) issue was addressed as one of the

recommendations which the Association adopted at the North American Widllife and Natural Resources Conference in Portland, Ore. March 28, 1982 in the organization's initial response in opposition to the Army proposals as they were unveiled on Jan. 29 of that year.

We raised objection at that time to proposed elimination of the multi-level resolution process that had been authorized under MOA's then in effect between the reviewing agencies and the Corps.

The question of dredge disposal was dealt with in an Association position adopted last March 20 in Kansas City relating to EPA 404 (b) (1) guideline changes which had been published earlier in the Federal Register as an Advance Notice of Proposed Rulemaking but which had not progressed to the point of a formal proposal when we reacted and which are still being held at the agency now.

Our expressions of opposition to the reform proposals have not, however, been confined to these two occasions.

With your indulgence and in the hope that it will contribute something to the cumulative record of evidence on the issue before your subcommittee, I will mention briefly other actions we have undertaken at various stages of that continuing campaign for modification or recall of the proposals.

The first of the series after the initial position statement was in the form of an April 7, 1982 letter to Vice President George Bush in his capacity as Chairman of the President's Task Force, and which outlined the Association's detailed, section by section analysis of the Army proposal and urged that he act to modify those recommendations.

On Aug. 19, 1982 the Association's formal opposition to interim final 404 regulatory changes as published in the Federal Register of July 22 was outlined in a letter to Army Secretary John O. Marsh Jr.

That was followed by adoption of an Association resolution at its annual meeting Sept. 21, 1982 at Hilton Head Island, S.C., pointing up the joint threat to wetlands resources posed by the July 22 interim final regulations and an Aug. 23 request by the EPA for comment on possible changes in 404 (b) (1) guidelines, and posing a question as to whether the existing presumption against discharges into wetlands should be changed.

The IAFWA answer was an unequivocal "no" to weakening

changes on both Section 404 fronts.

With your permission, Mr. Chairman, I offer a copy of that resolution for the record at this point.

Going one step further, the Association asked, and was given, permission to file as an amicus curiae (friend of the court) in the suit filed Dec. 22, 1982, against the Secretary of the Army and Administrator of the EPA in U.S. District Court to block implementation of the July 22 regulations as adopted.

Our position now is the same as it has been throughout that period--that the organization and its members are quite willing to accept reasonable changes in the 404 program that will contribute to elimination of delays and increase effectiveness of its operations, but only when, and to the extent, that can be done without adversely impacting wildlife needs and interests. That has been the thrust of our presentations on the subject and we will continue to seek a resolution of the problem within that framework and philosophy.

We look forward to working with you and your subcommittee toward that objective, Mr. Chairman, and appreciate the chance to share our views on the issue with you.

Mr. ROE. Please proceed.

TESTIMONY OF ROBERT P. DAVISON, PH.D., FISHERIES AND WILDLIFE DIVISION, NATIONAL WILDLIFE FEDERATION; DR. WILLIAM Y. BROWN, SENIOR SCIENTIST AND ATTORNEY, ENVIRONMENTAL DEFENSE FUND; AND WES HAYDEN, INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES

Mr. DAVISON. I am Robert Davison, legislative representative for the National Wildlife Federation's Fisheries and Wildlife Division.

I appreciate this opportunity to voice support for the section 404 program and to urge this subcommittee to adopt the amendments to section 404 proposed in H.R. 3282, the Water Quality Renewal Act of 1983, introduced by Chairman James Howard.

In the past year and a half, the Department of the Army has substantially revised the section 404 program and further changes have been proposed. A number of these revisions and proposed revisions particularly concern us because they seriously weaken the ability of section 404 to protect this Nation's waters, especially its wetlands.

Of all those so-called regulatory reforms that have been implemented or proposed, there are two that I particularly want to address here today because they are the subject of H.R. 3282's amendments to section 404.

First, the new so-called streamlined interagency memoranda of agreement signed with Army in July 1982 that seriously weaken the ability of Federal resource agencies to review projects and recommend mitigation and project modifications.

These present agreements vest the Assistant Secretary of the Army with the authority to veto requests for review by the Federal resource agencies. They eliminate the opportunity for corps divisions to review permit decisions. They limit the issues upon which

further permit review can be requested, to exclude biological issues, they reduce the public comment period on permit applications and greatly reduce the time available to the Federal resource agencies to review, comment upon, and object to controversial permit applications.

The administration justified the new terms of these agreements on the ground that the reviewing agencies were taking too long to review and comment upon permit applications and were abusing their authority to refer permits up the Army chain of command. Those claims are unfounded.

The review agencies complied remarkably well with the time constraints of section 404 and the agencies did not abuse their authority to elevate permit decisions. Less than one-half of 1 percent of all permits were elevated from a district to division engineer between 1977 and 1981.

We also believe that the administration erred seriously when it vested veto authority in the Assistant Secretary of the Army for permit referral requests.

We believe the interagency review of permit applications is essential to the wise use and allocation of our resources and that the Assistant Secretary's veto has crippled the review process and, in our opinion, thwarted Congress intent.

Since July 1982, Interior has elevated 15 permits to the Assistant Secretary of the Army for actions that would destroy more than 6,000 acres of wetlands. Of those 15, 5 requests for further review were rejected outright. Six permits were reviewed and subsequently issued without modification. Four accepted elevations are still under review.

These problems with the new streamlined review process prompted Assistant Interior Secretary Arnett to write Assistant Secretary of the Army Gianelli on January 7, 1983:

> Bill, I agreed to the 1982 MOA in hopes it would result in timely but equitable decisions. It is just not reasonable to expend extensive manpower to meet the current permit review schedule to repeatedly have our concerns fall on deaf ears.

Again, on July 27, 1983, Arnett wrote Mr. Gianelli stating:

"I believe the current MOA is limited to a process implementation and largely ignores resource issues."

Section 10(b) of H.R. 3282 seeks to make interagency review of permits once again a meaningful and equitable process. It would amend section 404(q) to adopt the MOA procedures in effect between March 1980 and July 1982, but with shorter time frames, and three levels of review rather than five.

The amendment would once again allow corps division review of permit decisions, would allow requests for further permit review based on resource considerations, and would allow sufficient time for Federal resource agencies to evaluate permits having significant environmental effects. But most importantly, H.R. 3282 removes the authority for the Assistant Secretary of the Army to veto requests for further review and we urge the subcommittee to support that section of the bill.

The second target of the so-called regulatory reform addressed by H.R. 3282 is EPA's 404(b)(1) environmental guidelines.

In May 1982 the task force on regulatory relief directed that these guidelines be shortened and simplified and, 3 months later, EPA issued an advance notice of proposed rulemaking concerning revisions to the guidelines. The change in administration at EPA has made it more uncertain whether the guidelines will be reviewed, and if they are, whether they will be weakened.

But Assistant Secretary of the Army Gianelli has pressed hard for substantial reductions in the environmental protection provided by the guidelines, and I direct you to appendix 5 of my written statement for substantiation of that charge.

Of particular concern to us is that the revisions will, as Assistant Secretary Gianelli has recommended, eliminate or limit the current presumption against wetlands destruction from disposal of dredged or fill material.

Section 10(a) of H.R. 3282 would place this presumption in the statute. Simply put, the provision prohibits the unnecessary destruction or alteration of wetlands where practicable alternative sites are available or where the project need not be located in a wetland to meet its objective. That is, where it is not water dependent.

For example, the construction of a marina is water dependent, whereas the construction of a shopping mall is not.

The immense value of wetlands and the stunning rate at which these resources are being destroyed certainly justify the presumption against development in wetlands. I believe there is also a good policy reason for insuring this presumption is maintained. Private investors, aware of the presumption and the difficulty it would cause in procuring a section 404 permit for certain projects that are not water dependent, such as housing, have sought alternative sites.

Thus, the present 404(b) guidelines have influenced expectations and changes in the guidelines, such as those recommended by Assistant Secretary Gianelli, would alter those expectations and could undo the long-term protection of wetlands.

Section 10(a) of H.R. 3282 would prevent changes and revisions in the presumption and would insure continued protection for wetlands and predictability for developers.

We urge the subcommittee to adopt its provisions.

In conclusion, in addition to urging the subcommittee to adopt the amendments to section 404 that are proposed in H.R. 3282, we hope that you will also report the amendments to section 404 which Congressman Mrazek plans to introduce. We believe that these would be an important adjunct to the foundation laid in H.R. 3282. These amendments would help control the discharge of toxic, dredged or fill material. They would increase EPA's oversight under section 404(c) of the corps' permit processing, and they would clarify that the citizen suit provisions of section 505 apply not only to the Administrator and section 402, but also to the Secretary of the Army and section 404.

And finally, we would urge you to reject attempts to limit the waters currently protected under section 404 and to voice your opposition to the recent regulatory changes and proposed changes to section 404.

Thank you.

Mr. ROE. Thank you very much, Dr. Davison.

Dr. Brown.

Mr. BROWN. Mr. Chairman, Mr. Hammerschmidt, members of the subcommittee, I will summarize my written statement.

It is a pleasure to appear before you today and to present testimony on section 404 of the Clean Water Act, the foremost existing authority for protecting wetlands of the United States.

My testimony is given on behalf of the Environmental Defense Fund and the National Audubon Society. We support the amendments to section 404 contained in section 10 of H.R. 3282, introduced by Mr. Howard, and the additional amendments contained in legislation that will be introduced by Mr. Mrazek.

We applaud the initiative and foresight exercised by Mr. Howard and Mr. Mrazek by introducing these bills, and we look forward to support for the bill from the chairman and members of the subcommittee.

If enacted, these amendments will set back on course a program that has been under siege by the Department of the Army since 1981. I will summarize a few highlights of the Army's record on section 404.

In October 1981, The Coordinator, an official publication of the U.S. Army Corps of Engineers, reprinted a headline and story from the Water Resources Congress newsletter calling for section 404 horror stories concerning review delays and jurisdictional determinations. That story stated:

"We must have more tales of woe connected with 404 if an adequate record is to be compiled."

The well of section 404 horror stories proved dry, however. Instead, the Army was flooded with evidence of successes.

In November 1981, the Institute for Water Resources of the Army Corps of Engineers submitted a regulatory impact analysis to the Office of the Chief of Engineers. It was 235 pages long plus appendices, and it was prepared to meet President Reagan's Executive order on Federal regulations. Among other things, the RIA found the following: Section 404 program has cut wetlands destruction roughly in half in the lower 48 States, reducing loss by more than 300,000 acres per year.

Forty-nine percent of section 404 permit applications are approved without modifications; 33 percent are approved with modifications, and 16 percent of the applications are withdrawn before a decision is made. Only 2 percent of the applications are denied.

The cost of complying with section 404 averages less than 1 percent of total project value.

And finally, the section 404 program as in operation when the RIA was prepared "results in a net positive benefit to the Nation."

The RIA, however, was quickly abandoned by the Army because, I suppose, rather than uncovering the horror stories, the RIA revealed sound operation of an important Federal program. It was clear the next step in reform of the program by the Army would have to go light on the facts.

On May 7, 1982, the Presidential Task Force on Regulatory Relief announced reforms to the section 404 program. These were spearheaded by the Department of the Army. Detailed changes were specified for the memorandums of agreement, to which my

colleague, Dr. Davison, has referred. There were other mandates in the May 7 announcement, including a mandate for shortening and simplication of the EPA 404(b)(1) guidelines.

The MOA's were revised in July 1982. They essentially eliminated the opportunity for careful interagency review and for elevation of permit decisions. Specific changes are detailed in my written testimony and Dr. Davison has described them.

The effect of these changes is to discourage adoption of resource agency recommendations on environmental protection. We do not expect to see the situation improve during this administration without action by the Congress. The Presidential Task Force decisions on this matter would be overturned and replaced with a reasonable substitute by the amendment to section 404(q) that is contained in section 10 of Mr. Howard's clean water bill. That amendment, for the most part, reinstates the situation as it was before the MOA's were changed and we urge you to adopt that amendment in this subcommittee.

On July 22, 1982, the corps issued comprehensive new regulations for its permit program. The principal changes made by the regulations were the issuance of many new and revised nationwide, general permits.

We and the National Wildlife Federation and 14 other conservation and resource utilization groups believe that the corps has issued some, if not most, of these general permits in violation of the law. Furthermore, the mischief in those regulations is not limited to general permits. We feel so strongly about this that we brought suit against those regulations in the Federal District Court of the District of Columbia. That suit is active now and just yesterday the State of Alaska also filed suit against the regulations. Even as we focused our resources to redress the corps' assault on its own regulations, the EPA began its own gambit.

On March 7, 1983, EPA submitted draft proposed section 404(b)(1) guidelines to the Office of Management and Budget, requesting approval for publication in the Federal Register. Among other things, those guidelines would have deleted the existing guideline requirement that no discharge shall be permitted if there is a practicable alternative to the proposed discharge which would have less adverse impact on the aquatic ecosystem, so long as the alternative does not have other significant adverse environmental consequences.

This reqirement is the heart of the EPA guidelines and, frankly, concerns the heart of the 404 program—the issuance criteria for permits. Deletion of that requirement would be particularly significant because it incorporates the water dependency test to which Mr. Davison referred: practicable alternatives are presumed to exist in the case of discharges into wetlands when the activity is not water dependent—for example, when the activity concerns a shopping mall as opposed to a marina. The corps must have evidence that practicable alternatives do not exist in such cases and this requirement keeps the corps from being fast and loose on issuing permits.

The draft EPA guidelines ran out of gas when Ann Burford was replaced by William Ruckelshaus as Administrator of EPA. We do not know what formulation of guidelines will eventually show up

in the Federal Register. I think Mr. Ruckelshaus has proved himself to be better on wetlands than his predecessor.

But it is a matter of record that the Army was not happy with the March 7 proposed draft guidelines. They thought they were too restrictive. For that reason, we are extremely pleased to see the amendment to section 404(b) which is in section 10 of Mr. Howard's bill. That would make the existing practicable alternative a mandate of Congress and although the language is not stated in the bill, we assume that the water dependency test is part of what Mr. Howard intends to have be adopted by that.

On May 12, 1983, the corps proposed amendments to its July 22, 1982, regulations and those proposals would turn bad to worse. There are a whole bunch of things that the May 12 proposal does that we believe are worn and illegal. Among these are proposed changes in issuance criteria for permits, changes that would subordinate environmental factors and elevate economics in permit application review, and changes that would fundamentally further obscure the relationship between the corps' public interest review and the EPA guidelines in decisions on the issuance of permits.

Just to give you one example, in section 320.4(j)(2), of the May proposal, it is stated that the District Engineer will normally accept decisions of State, local, and tribal governments on matters such as zoning and land use, unless there are significant issues of overriding national importance, such as national security, navigation, national economic development, water quality, and national energy needs.

Water quality is the only environmental factor recognized as nationally significant. Wetlands are not mentioned. That provision could basically mean that the corps has to issue a 404 permit if an area has been zoned for development, and a permit is necessary for the development unless one of these overriding factors, not including wetlands, is present.

Besides reemphasizing the need for Congress to end the debate on permit issuance criteria by legislating the current EPA guideline standards, the May 12 corps proposals illustrate the need for another amendment to section 404 that we understand Mr. Mrazek will introduce. The EPA has filed detailed comments on the corps proposals, including objections on environmental grounds to several of the nationwide general permits, some of which the corps has proposed to issue, and some of which are now in force.

However, the EPA has declined now and often before, to use the authority given to it under section 404(c) to halt these permits in their tracks. The time has come to stop EPA from giving lipservice to environmental concerns while, in effect, condoning the environmental degradation to which EPA objects. They cannot have it both ways. The Congress should not let them object to a permit and then not use their authority to stop the permit that they think is objectionable. EPA should be required to stop it. We understand that Mr. Mrazek will introduce an amendment to section 404(c) that will do that. EPA would be required to stop discharges if they would have unacceptable adverse environmental impacts.

EPA would also be required to review petitions for exercise of section 404(c) authority and, if those petitions provided substantial evidence, but only then, that the action is warranted, then EPA

would be required to decide whether or not to implement the petitioned action. The decisions by the EPA would be reviewable in court.

We also understand that Mr. Mrazek will introduce an amendment to section 505 of the Clean Water Act, the citizens' suit provision. We urge you to adopt that as well. His amendment would simply insert the Secretary of the Army into section 505 wherever the Administrator of EPA now appears. That apparently was an oversight in drafting. Those things are never known for certain, but we know of no reason for treating the Secretary any differently than the Administrator. Our sense is that since the Administrator is in charge of basically everything else under the Clean Water Act, when that section was drafted the drafters thought of the Administrator and simply did not think of the Secretary of the Army.

If anything, the record of the actions by the Army indicates a greater need for judicial review of what they are doing than of what EPA is doing.

Section 505 limits as well as facilitates such review, but overall Mr. Mrazek's amendment would make it simpler to take the corps to court on section 505 and that would be a good thing.

In conclusion, Mr. Chairman, members of the committee, we support and urge this committee to approve a Clean Water Act bill that adopts the amendments to section 404(b) and 404(q) that are contained in section 10 of Mr. Howard's bill and we urge you as well to support amendments to section 404(b), 404(c), and 505 that are being offered by Mr. Mrazek.

Nearly one-half million acres of wetlands are lost each year, a large share from dredge and fill activities. Wetlands are integral to preservation of the physical, chemical, and biological integrity of our Nation's waters. That preservation is the objective of the Clean Water Act, and the specific province of section 404. The time has come for the Congress to reinstruct the corps on these fundamentals.

Thank you.

Mr. ROE. Thank you.

Mr. Hayden?

Mr. HAYDEN. Thank you. I appreciate the opportunity you are affording for presentation of the views of the International Association of Fish and Wildlife Agencies on the issue before you today. To understand the position that I am going to outline, a word may be in order as to the makeup and mission of the organization.

We date back to 1907, to the days and philosophy of Teddy Roosevelt, and during our involvement in the ensuing years, we have been consistently committed to the cause of resource conservation and management in a balanced way. I emphasize the term "balanced," because that is the thrust of the presentation that we will be making today that we do not object to changes in the 404 regulatory program so long as they can be implemented and accomplished in a way that allows the resource needs to be addressed.

But we feel very strongly that the changes that have been proposed up to this point by the Assistant Secretary of the Army, and that were initially outlined in the advanced notice of proposed rulemaking by the EPA do not meet that criteria.

Getting back to the matter of the IAFWA's makeup, our membership includes the fish and game agencies in each of the 50 States and Puerto Rico, as well as Federal and provincial organizations involved in related activities in the United States, Mexico, and Canada and most recently the addition of an agency in Costa Rica.

With that sort of constituency, you could understand the interest we have in the matter that is now before you. We do fully support the 404 provisions that are included in Mr. Howard's bill. We commend the initiative that he has demonstrated in seeking to correct defects in the current regulatory reform proposals, and we find his proposals very welcome as a positive approach to a program and problem which has been addressed only in a negative fashion from other quarters.

You will want to know that both of the specific provisions that are included in H.R. 3282 for that purpose have been endorsed by the international association in addressing these matters previously, and most of my comments this morning are going to be directed to a chronology of the positions that the international has undertaken on this entire issue over the period of the past 20 months.

The most recent action that we took was at our annual meeting in Milwaukee in mid-September, when our executive and legislative committees did indicate support for the initiative that is outlined in Mr. Howard's bill.

As far as the chronology is concerned, it dates back to March 28, 1982, just a few weeks after the Assistant Secretary Gianelli had announced his initial recommendations to the President's Task Force on Regulatory Relief. We took exception to them at the time in a statement by the association at Portland, Oreg., and followed that up with a letter of April 7, 1982, to Vice President Bush in his capacity as Chairman of the President's Task Force. In it we cited the reasons that we felt that Mr. Gianelli's proposals had gone beyond the original intent and mission of the task force, and asked that they be substantially revised or withdrawn.

On August 19, our then president, Mr. Charles Fullerton of California, wrote on behalf of the association to the Secretary of the Army, listing our objections to the interim final regulations that had been announced on July 22. One of the chief objections we raised at the time was a concern over the proposal for use of nationwide permits for dredge and fill which we felt would severely constrict the geographical coverage of the section 404 program.

If you will indulge me, I will read a paragraph from that letter which bears on that point:

> As now proposed by the corps, the nationwide permit plan would allow disposal of dredge and fill material in the nontidal rivers, streams and adjacent wetland areas above the headwaters and all other nontidal waters that are not part of this surface tributary system to interstate navigable waters. The vast majority of the States have no effective dredge or fill regulations to replace Federal controls which would be eliminated under such nationwide permits.

Proceeding with the chronology, the association on September 21, 1982, at its annual meeting in Hilton Head, S.C., adopted a formal resolution expressing additional concerns over the the July 22 interim final regulations and a further concern over the action of the EPA taken on August 23 of that year requesting comments on pos-

sible changes in the 404(b)(1) guidelines. I offer that resolution for the record, if the chairman will allow it.

Mr. ROE. Without objection, so ordered.

[The resolution referred to follows:]

RESOLUTION NO. 3 ADOPTED BY THE INTERNATIONAL ASSOCIATION OF FISH AND WILDLIFE AGENCIES AT ITS 72ND ANNUAL CONVENTION, HILTON HEAD ISLAND, S.C., SEPTEMBER 21, 1982

THREAT TO WETLANDS PRESERVATION

Whereas, wetlands are critical to the survival of many fish and wildlife species, the maintenance of water quality, groundwater recharge and flood control;

Whereas, about one-half of the original 150 million acres of wetlands in the coterminous United States have already been destroyed.

Whereas, continued protection of wetlands is critical to meeting obligations of the United States under migratory bird treaties;

Whereas, interim final regulations for the Section 404 program published in the Federal Register on July 22, 1982, and made final on August 23, 1982, authorized nationwide permits allowing discharge of dredged and fill material into nontidal rivers, streams, lakes and adjacent wetland areas above the headwaters and into isolated nontidal waters;

Whereas, these nationwide permits would provide virtually no protection to millions of acres of prime aquatic habitats, including prairie potholes and other vital links to the international migrotory flyways systems;

Whereas, these nationwide permits would provide virtually no protection to millions of acres of prime aquatic habitats, including prairie potholes and other vital links to the international migratory flyways systems;

Whereas, on August 23, 1982, the Environmental Protection Agency requested comment on its Section 404(b) (1) guidelines, and asked whether the jurisdictional scope of Section 404 should be changed or the existing presumption against discharges into wetlands "retained, revised or eliminated";

Now, therefore, be it resolved, That the International Association of Fish and Wildlife Agencies requests the Administration and Congress to retain application of the Section 404 permitting process to all waters of the United States, including wetlands, as currently defined in the Section 404(b)(1) guidelines, and to retain and apply rigorously the existing presumption against discharges into wetlands;

Be it further resolved, That the nationwide permits for discharges into nontidal rivers, streams, lakes and adjacent wetlands above the headwaters and into isolated waters should be revoked and that permit applications for discharge of dredged or fill material into these areas be considered on an individual basis to insure needed protection of these critical natural resources and associated values.

Mr. HAYDEN. The next step was our entry as an amicus curiae in the December 22, suit filed against the Secretary of the Army and the Administrator of EPA in U.S. District court for the District of Columbia, by the National Wildlife Federation and other associated organizations. As you have heard this morning, that suit is still in active litigation.

Last March 20, at our meeting at the North American Wildlife and Natural Resources Conference in Kansas City we took a specific position in opposition to the EPA advanced notice of proposed rulemaking which had been announced on August 23 of last year, but which has never proceeded beyond that point. It is my own personal feeling that those EPA revisions of the section 404(b)(1) guidelines may not ever see the light of day. That is only an impression from conversations with people who have some knowledge and information about the matter.

Then there comes the question of the May 12 additional regulations proposed by the Department of the Army for the section 404 program. Our response to that has also been negative, both in the

name of the association and in representations from the individual States.

I can report to you that 38 out of the 50 States filed exceptions during the comment period to one or more of the provisions in the May 12 proposed notice of rulemaking. That was followed up by participation in a hearing by the Corps of Engineers on this subject on October 12. Six individual States as well as the association presented testimony in that hearing.

It is now my understanding that any final rule on the May 12 proposals will be delayed until at least the end of December and perhaps well into the new year.

There is some question as to how much they may be changed from the original form, but I certainly believe that those offering them are beginning, to some degree, to understand the level and the strength of the opposition to some of those proposals.

As I said at the outset, Mr. Chairman, our position has been at all times that we did not object to a rational, balanced approach to this problem and changes which would affect and accomplish an improvement in the operational efficiency of the section 404 program so long as it could be done without damage to priceless resource facilities. That remains our position.

One other point that I would make. Mr. Mrazek's proposed amendment just came to my attention this morning. I could not speak officially for the association at this point, because it has not been brought to the attention of our legislative committee. I believe, however, that as outlined we would find his suggestions quite acceptable.

We look forward to working with you and your subcommittee in your examination of the section 404 problem and finding a practical solution to it and we appreciate the chance to share our organization's views on it with you.

Thank you, sir.

Mr. ROE. We want to thank you very much for all of your testimony. I think you have clearly brought into focus the areas of concern, and also some refinements to some of the proposals that Mr. Howard has made in this legislation.

The Chair would defer to the gentleman from Arkansas.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman.

Mr. Brown, on page 7 of your written statement, you discuss the fact that the Environmental Defense Fund and other conservation organizations have filed suit challenging the corps' July 22, 1982, regulations. I wonder if you could provide us with an update on the status of that litigation.

Mr. BROWN. I would be delighted to. We have had two or three status conferences with the judge. Litigation was filed on December 22, 1982, almost 11 months ago, and shortly thereafter we filed a motion for summary judgment on the principles claims in the lawsuit.

The foremost single claims were against the headwaters and isolated waters general permits on the grounds they had excessive environmental effects and also they——

Mr. ROE. I did not hear you.

Mr. BROWN. Excessive environmental impacts and also on the grounds that they encompassed activities that were not similar in

nature as required by section 404. Those permits authorize somewhere around 100,000 discharge activities in the waters of the United States each year, essentially without regulation, and we have ample evidence that many of those activities are deleterious.

The Government filed a motion to dismiss shortly thereafter. It was not until last summer that we heard from the Court and since then we have had, I believe, three status conferences. It may be two. We have been discussing the possibility of settling the case with the Government, and also with an array of intervenors who have intervened in the case. They include the American Petroleum Institute and 6 oil companies, 15 phosphate companies——

Mr. ROE. Can you pull your microphone forward?

Mr. BROWN. We have been discussing settlement with the Government and the intervenors in this lawsuit for several months now. I was enumerating the intervenors. They include the American Petroleum Institute, a number of oil companies, phosphate companies, just about all of the utility companies of the United States, the National Coal Association, the American Mining Congress, and others. We think there is a good chance that we can settle the case.

We have prepared a 15-page agreement which has 26 paragraphs in it that address the principal issues. We have reached some agreement with at least some of the Government lawyers and our lawyers on one package that the Government would seem to be willing to recommend to their superiors and that we would endorse.

I think it probably would not be a good idea to go into the details of the agreement at this point, because I think there is still too much uncertainty as to which player may appear and turn over the applecart. I guess the bottom line is we are discussing settlement, and we think there is a pretty good chance we can reach a settlement with the Government. I think the odds are greater than 50-50 that we will. A lot of uncertainty turns on whether Mr. Giannelli will agree to what his attorneys recommend to him and that is very hard for us to predict.

We expect to have the agreement signed in the next 5½ weeks or not. If we succeed, then the settlement agreement itself will call for the issuance of new regulations. They would be proposed first. They would be the subject of public comment. The corps would not in a final way commit itself to anything, nor would we agree to walk away from the lawsuit until we saw the final regulations.

Suppose that the agreement is approved 6 weeks from now. The way it would work is that final regulations would be issued somewhere about a half year later. If the regulations did the things that the agreement says, we would dismiss our suit. Nothing would happen as a final matter until about half a year from approval of the agreement. If we fail in those discussions, we intend to go back to the court and to press for a ruling of the judge on our summary judgment motion and their motion to dismiss as well. We would be talking about 6 months, certainly, until we get some sort of a ruling out of the court on that.

Mr. HAMMERSCHMIDT. You view the proposals you made for now as privileged information and you would not want to make it public because it might upset the negotiation process?

Mr. BROWN. I would be grateful if the chair and you were to let us treat them in that way.

Mr. HAMMERSCHMIDT. Well, if you think there is any way that this committee would properly be helpful in that negotiation, that might be a possibility. I am not sure that is within the realm of possibility or whether it is proper.

Mr. BROWN. There is one point. If we do succeed in reaching an agreement that we can sign and that is recommended to Mr. Gianelli, at that point it might not be improper at all for some expression of position on it, because I think it would be a political matter at that point.

Thank you.

Mr. HAMMERSCHMIDT. Thank you, Mr. Brown.

Mr. Davison, on page 6 you express the opinion that regulations proposed by the corps on May 12, 1983, would "define terms within the definition of wetlands so that approximately two-thirds of the wetlands in the coterminus States would be excluded."

Would you expand on this statement for us? More specifically, what terms are you referring to and how is it that you believe the proposed definition would affect these terms?

Mr. DAVISON. I would be happy to. The term that I was referring to specifically is prevalence of vegetation; which appears in the definition of wetlands. In the May 12 proposed regulations, Army defined this hitherto undefined term to mean those rooted emergent plants that comprise at least 50 percent of the dominant species within a plant community. Rooted emergent plant refers to things like cattails, bullrush, not woody species. The Fish and Wildlife Service, in its recent inventory—its recent status and trends report on the status of wetlands in the lower 48 States—estimates that about 66 million out of the 99 million acres of wetlands in the lower 48 States are not dominateed by emergent plants, that is, ⅔ or our wetlands are tree swamps, shrubby wetlands along the Carolina coast, bogs, tundra and a wide whole variety of other kinds of nonvegetated wetlands. That is where that estimate comes from.

Mr. HAMMERSCHMIDT. That is the Fish and Wildlife Service number. Is that correct?

Mr. DAVISON. Right.

Mr. HAMMERSCHMIDT. Mr. Chairman, I just have one more question.

Mr. Brown, on page 12 of your written statement you discuss Mr. Mrazek's section 404(c) amendment requiring EPA to stop dischargers that would have an unacceptable adverse environmental impact.

What do you believe would or should constitute an unacceptable environmental impact for purposes of this provision? How should it be defined?

Mr. BROWN. I have not thought about that in great detail, but I suppose that EPA could use the same kinds of standards which are now described in the EPA section 404(b)(1) guidelines, for judging whether significant degradation of the Nation's waters would occur. Under those guidelines, failure to meet that standard is the basis for a denial of a permit. The guidelines themselves are quite detailed.

Mr. HAMMERSCHMIDT. Mr. Brown, it would be entirely acceptable to the committee if you would supply that for the record, if you want to give it some more thought.

Mr. BROWN. Thank you.

[See letter supplementing testimony, p. 2126.]

Mr. HAMMERSCHMIDT. Let me say, the panel you brought with you has very detailed comprehensive testimony supporting your position.

Mr. ROE. Are there other questions?

The gentleman from California.

Mr. PACKARD. Perhaps one, maybe two.

Mr. Davison, I am confused a little bit. In your written statement—there appears to be a contradiction and I just need some clarification.

On page 21 of your statement, in the second paragraph, you indicate that only 17 percent of all of the permit applications received by the corps are for activities in nonnavigable waters.

However, in the preceding paragraph you suggest that the effect of H.R. 1570—which would limit the scope of section 404 permit program to waters navigable in fact, historically navigable, or in fact capable of becoming navigable—would remove from Federal protection under section 404 the vast majority of the Nation's wetlands, perhaps 126 million of the 148 million acres currently covered.

That seems to be a little bit of a contradiction. Would you clarify that for us, please?

Mr. DAVISON. I would be happy to. The statement as to the waters that would be regulated under section 404 and the changes H.R. 1570 would make if enacted, would be in the extent of the waters that are covered by the program. Now a lot of those waters are covered, for instance, presently under nationwide permits. There are two such nationwide permits, one for isolating lakes and wetlands, and one for waters above the headwaters or streams, which do not require individual permits. There is a great deal of activity going on there under the nationwide permits. So the amount of individual permitting in wetlands other than those adjacent to navigable waters is a relatively small percentage of the total permitting.

Mr. PACKARD. Thank you.

I think that is sufficient, Mr. Chairman.

Mr. ROE. Any further questions?

Let me ask one question that is puzzling me.

In the water resources development legislation which we have been working on for a year and a half, we recognized one basic issue, that the corps was the lead agency and received their input from the different agencies, Wildlife and so forth, into the environmental impact statement situation—and then when that came full circle, it came back to the corps to review that data and then make their findings. There was not any other mechanism available, at least that we could see, other than the courts. If Congress approved a particular project to be built as a Federal project, or a combination of Federal, municipal and State project, flood control, resource control, hydropower, whatever the issue may be, that they did not re-review, the committee did not re-review the content of the envi-

ronmental impact statement, although they did look at growth errors that may arise. We felt this to be quite a fallacy in the whole program, and that was borne out as we got into the different 2,720 projects that were planned for developing.

So they were case histories of project development in the interest of the public.

Then we go back to the comments that were made by Mr. Hayden, where we talked about a rational, balanced program. Now it seems to me, rational, balanced program as compared to what? What we did in the water resources development bill, we analyzed those areas and we created a new mechanism and we came back and said in these instances where the applicant would have to submit, or the Corps, would have to submit that data back to the committee, the committee could re-review and make a determination if there was some intrusion that emerged as the project was unfolding.

It seems to me when we are talking about section 404 permits and we are talking about a reasonable, balanced program. That puzzles me a bit, because I do not know if we can approach a reasonable, balanced program, or whether we want to.

The committee is saying there are some areas we want to call to Congress attention, in mitigation, for example. It is very expensive. But we believe, from a committee's point of view, that those issues should be looked at by Congress, and if it is going to cost $100 million to correct that to provide for intrusion within the public interest, we are responsible to be able to provide that kind of mitigation that is necessary.

In order to implement that further, we set up the Environmental Development Revolving Fund so we can protect those sensitive areas immediately upon a determination by Congress to authorize a particular project and giving the Corps the immediate right to enter into or acquire or preserve those lands so someone in the process did not go in and cut down all of the hardwoods. We mitigated and saved all of the hardwoods, but there was not a mechanism to go ahead and move those areas, then private enterprises come in and cut down the trees, so finally when the mitigation plan could be implemented, when Congress could move with the funds, the whole thing would be lost in the battle.

With that recognition, what is puzzling me, we are talking about allowing intrusions under the section 404 permit situation. We evaluate that but we are allowing intrusions.

I am saying what about trying to establish a mechanism that says if it is a sensitive wetlands area, that it ought to be preserved in the public good. We have provided for that in the clean water bill. There were 1,700 acres of wetlands in the Mobile Harbor project, and at the point of dredging the material, were you either to dump that dredge material on those 1,700 acres, or at a cost of about $30 to $35 million more, take that material out, which appeared to be a better environmental decision, and dump it into the Gulf of Mexico? Is that a reasonable disposition for someone to make on the basis of protecting those 1,700 acres?

Happens to be from all of the reports we have received, the 1,700 acres was the only 1,700 acres left in that area.

We have recommended that to Congress. Albeit it is a very expensive decision to make. We assumed on the basis of the facts it is the right decision to make, but we are hoping Congress will sustain that.

Have you thought further beyond the point of view of the regulations and all of the things we are talking about?

Should we be saying to the American people that the whole purpose of the section 404 is to make a balanced judgment, but where there are sensitive wetlands that should not in any circumstances be allowed to be degradated or destroyed, should there be some process where they should be protected in the public good in perpetuity?

Then it comes down to do we have the right under the Constitution to in effect come back and say we are taking—extinguishing private ownership without due process under the law.

Are you with me so far?

Mr. DAVISON. Yes.

Mr. ROE. I think it would be helpful to the committee, we are talking about a process in an adversary situation, as to whose judgment prevails versus the point of view of what is the right thing to do. I would like you to review part of your thought process and go beyond this amendment and that amendment to the next 5,000 years, if we live long enough, and come back and say should we be taking a gutsy approach and say if these wetlands are that critical to the environment and that critical to the receiving waters, that they should not be defiled at all.

Would you like to comment on that? It is a long statement but it has to be put in for continuity.

Mr. DAVISON. I guess I would just briefly.

I think that it is difficult to set aside ahead of time some x number of acres of wetlands that ought to be protected. For one thing, we do not have an adequate inventory of the Nation's wetlands and we do not have adequate knowledge about the contributions provided by those wetlands.

What I am saying is I do not think we have the adequate knowledge base to say that—in some cases, we do. But I do not think overall we have adequate knowledge to write into law that these wetlands ought to be protected and these wetlands should not. The destruction of wetlands in this country results from a tyranny of small decisions. If, for example, you look at 404 permits, most are for small acreages.

Mr. ROE. That is precisely on target, the point I am making. It has been a series of small decisions that have created the purpose—your concern, your organization's concern on the millions of acres being destroyed on a national basis. So we are caught in the middle of small decisions that are creating the problem, but we have not looked at a solution where the big decision is.

But, go ahead.

Mr. DAVISON. I would suggest strengthening EPA's role in section 404—the EPA already has the authority to interpret 404(c) to say, no, this wetland should not be developed at all, we should not be talking about reasonable development in this wetland, we should put it aside.

Mr. ROE. I know that is in the law. But that is not what has happened and that is what the concern is.

Mr. DAVISON. I agree, and that is what attracts me to what Mr. Mrazek may be introducing, which would put an affirmative burden on EPA to exercise the authority that they have under 404(c), which they have only exercised one since 1972. I think one avenue to take would be to try to increase EPA's involvement in the oversight of wetlands permitting. Certainly in some wetlands, with some kind of development, development can occur in a manner that is compatible with preservation of the wetlands.

In other types of wetlands, or other kinds of development, that is not going to be the case, and I think we ought to set those areas aside. But the only way I see to do that at the present time, although I would be happy to think about this a lot more, is to deal with that on a case-by-case basis. I do not see any way with our present knowledge of the inventory of wetlands in this country or the relative importance of those wetlands to make that judgment ahead of time.

Mr. ROE. Then how can we decide about a rational sound program? For example, in the Delaware Bay, Dr. Haskins is doing some of the most advanced work in the area on oysters. I happened to be down there the other day. The level of salinity and flow in the Delaware River has a bearing on the environment for those oysters to propagate and whether they are going to survive or not The situation was an almost untraceable toxic coming out of a particular plant. That plant had met every standard but nobody had asked the oysters. They literally destroyed parts of that bay because that whole ecosystem and man's intrusion was not being monitored properly.

The question I am trying to get at it seems some place down the line, if we are going to nail down this wetlands situation, what should we be doing, do we need more inventories, more studies, more blanket authority—I am not sure I want to entrust all of that to EPA, to be perfectly blunt about it.

Mr. DAVISON. I will yield to Dr. Brown because I think he has some comments that would be useful on this. But I would say, yes, we do need to complete an inventory. The present Fish and Wildlife Service inventory of wetlands in the coterminus States is about 26 percent complete. That is, that amount of the 48 has been flown and mapped and inventoried. We do need to complete that. I think there are a lot of other improvements that could be made in Army's implementation of the program; to accept EPA's definition of fill to recognize the need to protect the full range of wetlands, and to get them to exercise their authority as well as to give greater attention to the views of the resource agencies on permit decisions. And perhaps we should be seeing more permit denials.

Mr. ROE. Mr. Brown?

Mr. BROWN. Mr. Chairman, it seems to me there are several things to observe in response to, I think, your very astute question.

In the first place, we have to acquire wetlands, the ones that are the most important, and there are programs to do that but they are not as strong as they should be. There is legislation which has been approved by the Environment and Public Works Committee in the Senate and in a somewhat different form by the Merchant

Marine Committee in the House—the Emergency Wetlands Protection Act of 1983. I am sure it will be 1984 before it becomes law.

The basic purpose of those bills is to raise money for the acquisition of wetlands and the bills are crafted so they would not just apply to wetlands that are habitats for migratory waterfowl, which long has been an important focus, but to protect water land ecosystems more broadly. Support for that is one way to address your question.

I have perceived the 404 program as the other way to address wetlands protection. We do not have enough money to buy everything, but we can still help protect wetlands by regulating their use. I think there probably should be more permit denials, but I think probably the heart of the 404 program is in conditioning, in mitigation of actions, which often relate to the way that an activity is conducted.

The corps' RIA that I referred to evaluated the effect of the section 404 permit process on the amount of wetland acreage that would be destroyed by permitted activities. The RIA estimated the wetlands acreage that would be destroyed assuming that the activities would be conducted as the applicant proposed, and then compared this with the amount of wetland acreage that was in fact destroyed through the activities after permits were issued, and the permits themselves had been conditioned. The RIA found that the amount of acreage lost was cut about in half. So that is an important positive thing.

Mr. ROE. Did they then speak to mitigation?

Mr. BROWN. It depends on what one means by mitigation. I think most of the wetlands savings was not related to acquisition, including offsetting of destruction by acquisition of other acreage away from the site, but related instead to modification in the way that the activity was conducted. The Army's commitment to mitigation, including acquisition such as up-front buying wetlands or requiring the applicant to buy wetlands, however, is problematic. Your support for Mr. Howard's 404(b) amendment would help on this because the EPA 404(b)(i) guidelines now contain a provision for mitigation. They require the adoption of any reasonable measures to mitigate, although no money is necessarily available. I think that part of what you were asking is whether the Congress should provide some sort of fund that the corps could tap to lead it to mitigate more. But, number one, the codification of the (b)(1) amendments would help. The corps has been resistant to mitigation, and I think the EPA guidelines, if the Congress endorsed them, would push the corps toward more mitigation.

One thought that came to my mind when you were talking is whether it might be advantageous to have a fund which could be readily tapped, set up by the Congress, which would be available for the corps in mitigating the impacts of activities that it permits under 404.

Mr. ROE. We have done that. We have a $35 million revolving account in the omnibus bill. I am wondering if we should have something in this bill.

Mr. BROWN. I am not sure what funds the corps can tap.

Mr. ROE. We set up a special fund that would be set up as a revolving fund that they can tap on any environmental issue that

they felt was necessary to move at any one point, and the fund would be replaced from money allocated to the project.

Mr. BROWN. As you define that fund, it is available to the Corps for section 404 activities?

Mr. ROE. For those projects. But you have thousands of permits being requested in the 404.

Mr. BROWN. It seemed to me it probably would be useful under section 404 to be able to tap funds for mitigation on piecemeal little projects. It seems to me that probably would be a good idea. Money is tight however.

Mr. ROE. I do not want to take everybody's time.

If you take a little piece here or there, that does not put the whole thing in focus. I do not think you can write a perfect piece of legislation. But we know the problem exists, and we are nipping away at the fringes because we have not come to grips. If we are talking about priorities, and forgive me for making a speech, if we are talking about priorities in the environment, then we have to identify the priorities and say to the Congress of the United States we are going to spend our life in court and not achieve it, because you could not go that many cases amicus curae. There are that many permits. It is a policy decision you are trying to get in a better fashion. Is that unreasonable?

Mr. BROWN. No, it is not unreasonable, and I share the desire of many to be a hero.

As we see it, we have got to raise all of the money we can for wetlands. We need to identify priorities obviously, the money should be spent on the greatest priority wetlands. We have been pushing for every device conceivable.

Mr. ROE. We both agree that what we have suggested is not perfect. All I want to do is stimulate your thought processes.

We have not finished writing this bill and I have listened intensively to the particular amendments you refer to. You referred to Mr. Howard's bill and Mr. Mrazek's amendments. I am trying to get you to think big. What do we do next? Then we have to go through the corps, how it is going to be interpreted, and who is the Administrator, and whatever happened from May 15 to November 15, I do not mean it irresponsibly or irreverently. I do not mean it that way. All I am saying is do you think you have attacked the problem big enough in the magnitude of the problem we are facing? I would like you to think about it.

Are there any other questions?

I would like to thank you very much for your thought-provoking testimony. It has been excellent and we would like to hear from you further and particularly look into that environmental fund because I think that is one of the key issues we have to start dealing with.

Thank you very much.

[Subsequent to the hearing, the following was received from Mr. Brown:]

ENVIRONMENTAL DEFENSE FUND,
November 29, 1983.

Hon. ROBERT A. ROE,
Chairman, Subcommittee on Water Resources, Committee on Public Works and Transportation, Rayburn House Office Building, Washington, D.C.

DEAR MR. ROE: I am writing to address the two questions asked of me by Members of the Subcommittee on Water Resources when I had the pleasure of appearing before the Subcommittee on November 9, 1983.

QUESTION 1

The first question, posed by Mr. Hammerschmidt, asked for clarification of the meaning of "unacceptable adverse effect" as used in Section 3 of H.R. 4393, a bill introduced by Mr. Mrazek.

The "unacceptable adverse effect" standard is already contained in Section 404(c) of the Clean Water Act; the amendment set forth in Section 3 of H.R. 4393 would not change that standard in any way. H.R. 4393 would change Section 404(c) by making use of that authority non-discretionary when the Administrator of EPA had determined that an unacceptable adverse effect would result from any discharge. H.R. 4393 also would establish a mechanism pursuant to which the Administrator of EPA could be petitioned to exercise the Section 404(c) authority.

The meaning of "unacceptable adverse effect" under Section 404(c) is defined as follows in current EPA regulations found at 40 C.F.R. § 231.2(e):

> "unacceptable adverse effect" means impact on an aquatic or wetland ecosystem which is likely to result in significant degradation of municipal water supplies (including surface or groundwater) or significant loss or damage to fisheries, shellfishing, or wildlife habitat or recreation areas. In evaluating the unacceptability of such impacts, consideration should be given to the relevant portions of the Section 404(b)(1) guidelines (40 CFR part 230).

The preamble of the EPA regulations (44 Fed. Reg. 58078, October 9, 1979) briefly discusses this definition. The preamble states: "The term 'unacceptable' in EPA's view refers to the significance of the adverse effect—e.g. is it a large impact and is it one that the aquatic and wetland ecosystem cannot afford." The preamble also states:

> [O]ne of the basic functions of 404(c) is to police the application of the 404(b)(1) guidelines. Therefore, those portions of the guidelines relating to alternative sites may be considered in evaluating the unacceptability of the environmental impacts. . . . . Of course, even when there is no alternative available, and "vetoing" the site means stopping a project entirely, the loss of the 404(c) resources may still be so great as to be "unacceptable."

The "relevant portions of the Section 404(b)(1) guidelines" referred to in 40 C.F.R. § 231.2(e) are thus those that address whether alternative discharge sites are available and whether a discharge will result in significant degradation of aquatic resources or otherwise will have an impact that an ecoystem cannot afford. These provisions are contained in Subpart B, entitled "Compliance with the Guidelines," and in the other portions of the guidelines referenced therein. In addition to setting forth standards for restrictions on discharge, these provisions describe in detail the factual determinations, evaluations, and tests that are to be followed in making a judgment on whether discharges comply with the guidelines. The meaning of "unacceptable adverse effect" has not, and probably cannot, be defined in a way that removes all uncertainty from determinations under Section 404(c). The detailed procedures of the EPA 404(b)(1) guidelines, however, ensure that all relevant factors will be considered in detail before the EPA Administrator may prohibit or restrict discharge under Section 404(c).

QUESTION 2

The second question, posed by yourself, asked whether creative thought might produce a new legislative mechanism that would arrest the piecemeal destruction of wetlands now occurring. You suggested that such a mechanism might be designed to enhance our capability to protect certain priority wetlands completely. Your question is as difficult as it is important, but I will summarize a few thoughts on the matter for consideration by the Subcommittee.

The Congress can protect wetlands from conversion to other status by providing for direct regulation of activities that are destructive to wetlands or by adjusting factors that serve as incentives for destruction or for protection.

Destructive activities may be regulated with varying degrees of comprehensiveness. Outright government purchase of property interests has provided the most substantial and enduring protection, and the Congress should enhance our national capability to acquire such interests. Legislation for this purpose, entitled the Emergency Wetlands Resources Act (H.R. 3082; S. 1329), has been approved by the committees with principal jurisdiction in the House and Senate and now awaits further action by the Congress. These bills, particularly the Senate version, would significantly augment revenues available for acquistion of property interests in wetlands. Even under the most optimistic scenarios, however, with ten-year funding approaching one billion dollars, such legislation would only provide for acquisition of enduring property interests in one or two percent of the remaining wetlands in the United States.

Well into the 21st century, effective governmental protection of the wetlands will depend primarily on regulation and other initiatives that do not entail the cost of compensating owners for acquisition of governmental property interests. Although generally less intensive than acquisition in degree of protection provided for a given area, such initiatives potentially can have immediate, beneficial effects for a large portion our nation's wetlands.

The Section 404 program of the Clean Water Act is most important federal regulatory program for protection of wetlands. A 1981 Corps regulatory impact analysis on its permit program estimated that Section 404 has reduced wetland loss by half in the 48 contermious states, amounting to over three hundred thousand acres saved each year. More recent estimates of wetlands loss suggest that this figure may underestimate the value of Section 404. The Section 404 program accomplishes that reduction almost entirely through modification—rather than prohibition—of discharge activities.

The most needed amendments to Section 404, as the program is now conceived, are those that would better ensure that potential discharge activities are carefully weighed against the criteria of the current EPA Section 404 (b)(1) guidelines and are not allowed if inconsistent with those criteria. The amendments to Section 404(b) and 404(c) in H.R. 3282 and H.R. 4393 would accomplish this purpose. The Section 404(b) amendments would prohibit discharges for which there exist practicable alternatives with less adverse environmental impact. This standard, which incorporates the "water dependency" test in the case of discharges into wetlands, is the heart of the issuance criteria for Section 404 permits.

Enactment of the Section 404(c) amendment of H.R. 4393 would prompt use of the authority of the Administrator under this subsection and could significantly improve our national ability to limit piecemeal destruction of wetlands. Section 404(c) authorizes the Administrator not only to "veto" the issuance of any particular Section 404 permit but also to prohibit in advance the issuance of such permits within any "defined area." In other words, the Administrator is in a position to systematically identify wetlands of particular significance and of special sensitivity to the effects of discharge activities and to place those wetlands off limits to such activities.

The Clean Water Act does not regulate all activities that are destructive to wetlands. Some draining and clearing, for example, may not entail discharge of dredged or fill material yet can be very destructive. It would be good for wetlands if such destructive activities were brought within the scope of federal regulation. EDF has not pressed for this expanded authority for pragmatic reasons. We do not believe that amendments of this kind would be passed by this session of Congress, although we would enjoy being proven wrong. The Section 404(b) and 404(c) amendments would bring into operation the broadest restrictions on destructive activities that I believe are currently feasible and that are possible without acquisition of property interests and the associated cost of compensation. Coupled with the pending Emergency Wetlands Resources Act (S. 1329; H.R. 3082), these are the "big ideas" that you are seeking in this session of Congress.

In addition to new authority for acquisition and for regulation of destructive activities, our nation would profit from legislation that would create incentives for protecting wetlands and would remove subsidies for destruction. The Emergency Wetlands Resources Act would direct a study of the degree to which federal subsidies contribute to loss of wetlands and would require the Secretary of the Interior to provide the Congress with recommendations on whether such subsidies should be modified. The chairmen of the House and Senate committees that developed that wetlands legislation also have expressed an interest in review of tax legislation to determine whether amendments can be developed that would enhance wetlands protection. These amendments could create incentives for protection (e.g. through allowance of deductions for gains on the sale of wetlands subject to conservation easements) or could remove provisions that contribute to destruction (e.g. deductions

from business income of the expenses incurred in draining wetlands). All of these initiatives are extremely important and we look forward to assisting their sponsors in developing the legislation. However, passage of such legislation probably will not come in this session of Congress and the package would be separate from Section 404 and the Clean Water Act.

Thank you for the opporunity to provide these views and those presented in my testimony of November 9, 1983. I would be grateful if you would include this letter in the hearing record as a supplement to my testimony.

Sincerely,

WILLIAM Y. BROWN,
Senior Scientist and Attorney.

Mr. ROE. Next we have Mr. James Banks and Ms. Frances Dubrowski from the Natural Resources Defense Council.

We want to welcome both of our distinguished representatives representing the Natural Resources Defense Council. We have your statements which will appear, if there is no objection, in full in the record at this point.

[Statements referred to follow:]

NRDC
Clean Water

Statement of

James Taylor Banks
Senior Attorney

on

Reauthorization of the Clean Water Act

before the

Subcommittee on Water Resources

of the

House Committee on Public Works and Transportation

November 9, 1983

Introduction

We welcome the opportunity to share our views of various Clean Water Act amendments with this Subcommittee, and particularly appreciate the expeditious pace with which the Chairman is conducting these hearings. As always, we look to this committee's leadership in maintaining and improving the policies and provisions of this vital statute.

There are a number of sound, important amendments under consideration here and in the Senate. It is time to do something with those ideas, and we urge you to move toward a mark up as soon as possible.

In our view, the best collection of proposals put before this body thus far is HR 3282, offered by Committee Chairman Howard. We strongly endorse Mr. Howard's bill because it addresses a number of important concerns about recent administration of this Act, and because it says "no" to damaging proposals floated by EPA and others, such as the so-called pretreatment "opt out."

At the same time, it is apparent that HR 3282 can be improved. The bill does not cover anti-backsliding and non-point source controls, for example, and we believe both of these issues must be addressed by the House.

This statement focuses on two broad areas of concern that have arisen within the reauthorization process: the BAT program

for toxics, and the related subjects of water quality standards and post-BAT toxics control. These matters deserve your close attention and careful consideration in the days ahead.

Other questions and proposals should be noted at least in general terms, however, and the most important of these is construction grants funding. In July 1981, we came before this Subcommittee during its consideration of major reforms to the grants program. In the wake of Mr. Stockman's budget cutting fervor, I must admit to having felt lonely as a representative of a minority that urged Congress to stick by its commitment to a sizeable and meaningful federal financial commitment to municipal sewage treatment.

We argued then, and re-emphasize today, that the program should not be viewed as a failure, despite the GAO's repeated attempts to demonstrate otherwise. The program was (and is) simply not finished, and can never be expected to produce the results Congress envisioned for it without continued federal support. Under the 1980 needs survey, backlog needs for secondary treatment, advanced secondary, and new interceptors were estimated at over $55 billion. Subtracting reserve capacity left in excess of $30 billion, of which $24 billion would be the federal share at a 75 percent matching rate. Our anlaysis demonstrated that, because of inflation, meeting these needs ultimately would cost approximately $53 billion and take over 20

20-955 O—84——135

years. We objected to cutting the program's appropriation because it made no sense to take longer and pay more than necessary to curb municipal pollution.

Accordingly, we are encouraged that HR 3282 proposes to restore the Construction Grants appropriation for fiscal years 1984 and beyond. We are not encouraging the Committee to revisit all of the 1981 reforms, even though we disagreed with some of them at the time, because disruptive changes would only stand in the way of continuing progress. But we emphatically urge you to support an increase in the funding level because it is smart for pollution control and, in the long run, smart for the federal budget.

This and other issues could occupy many pages of written testimony and more hearing time than this Committee can afford. In the discussion below, we turn instead to two of the most important areas you must consider.

Best Available Technology

As this Committee thoroughly understands, "best available technology" (BAT) is the centerpiece of the Act's toxics control strategy. BAT is the principal regulatory tool for addressing toxic industrial discharges, and has been used successfully by EPA to control dozens of industrial categories. It is a flexible tool that demands only those treatment strategies that are

available and affordable. It asks industry to do what is reasonable, and therein lies the secret to its effectiveness.

From the hearings conducted last summer, it is apparent to me that this Committee continues to support the BAT-toxics strategy, and intends to maintain the integrity of EPA's program while making only such adjustments in the compliance timetable as are shown to be necessary. EPA's program has made great progress toward completing the strategy; now is not the time to chart a new course or to restructure EPA's approach. We hope and trust that the Committee will see this program through to a successful conclusion several years from now.

The Committee is being asked to consider three changes to the BAT-toxics strategy: a deadline extension and two different kinds of variances. I will address each of these proposals in turn.

1. Compliance Deadline Extensions

No one disagrees that the July 1, 1984 BAT compliance deadline must be extended. Because EPA is long overdue in promulgating effluent guidelines, sources in many industrial categories will not be given the minimum time necessary to construct treatment facilities and achieve compliance. Indeed, in some industries, EPA will issue final guidelines well after the July 1, 1984 deadline.

We think the Act should contain a rolling compliance period,

triggered by issuance of the regulations, rather than a single date. EPA is promulgating the regulations according to a phased schedule, with over four years between the first and the last. Any single date will give some industries far more time than necessary, or give others far too little, or perhaps both. Each industrial category should be treated approximately the same, and only a standard compliance period can accomplish that result.

Of equal importance, however, is the manner in which the Act addresses situations in which compliance can be achieved before expiration of the standard period. Presently, the Act requires compliance "not later than" the applicable deadlines, and this implies that each source should meet its obligations as soon as possible, as determined by the permit writer. We think this implication should be made explicit in the Act by requiring compliance "as expeditiously as possible, but not later than" the end of the period. With this language, the permit writer would be required to make an affirmative (and reviewable) judgment about the pace of compliance that is possible in each case -- enhancing the progress of toxics control and treating all sources equally under the law. In this regard, both HR 3282 and HR 2305 can and should be improved.

The principal question, of course, is the appropriate length of the standard compliance period. We believe Section 4 of HR 3282 provides the right amount -- three years for BAT limitations

on toxic and non-conventional pollutants.

Three years seems to be the period accepted by most of those who have addressed this issue. In last year's Senate hearings, both Dr. Hernandez and Mr. Eidsness stressed that industry could comply in 36 months or less. In the 1982 House hearings, the Edison Electric Institute said that "compliance should be required within 3 years following adoption of implementing regulations," and added that "this would allow EPA time to issue the necessary regulations and permits, and industry time to design and install treatment systems efficiently and economically." Similarly, the American Petroleum Institute and the American Consulting Engineer's Council have endorsed a three-year compliance period. CMA and NAM have suggested a 1987 deadline, which translates into three years for their industries.

In short, a three-year compliance period would be the responsible, outside deadline for BAT. For this reason, we support HR 3282, but urge you to reject the unnecessarily long compliance period furnished by HR 2305, which appears designed to provide the Steel Industry up to four and one-half years for compliance. Likewise, the Administration proposal of July 1, 1988, from which Mr. Ruckelshaus has yet to disassociate himself, is far too long and should be rejected.

Finally, the Committee should concern itself with the compliance period for permittees whose requirements are based on

"best professional judgment" rather than on effluent guidelines issued by EPA. This can be addressed in either of two ways. First, the Act could provide an absolute outside compliance deadline for BAT so that such sources will have an incentive to press EPA and the states for permit requirements. If this approach is taken, the Act should make clear that the ultimate deadline does not give EPA license to delay effluent guidelines until three years preceeding that date. Second, the approach we would prefer is to set a deadline for issuance of all BPJ permits and then provide up to thirty months beyond the permit issuance date for compliance by each source. (We recommend 30 months rather than 36 because no time would be required to issue the permit.) Such a provision would treat BPJ permittees the same as sources regulated by effluent guidelines, and would furnish a strong incentive for EPA and state agencies to get these permits issued.

2. BAT Variances

We understand that the Committee is being approached by representatives of the chemical industry for a water quality-based variance from BAT. You have heard a great deal about this issue over the last year or two, and you no doubt understand that the environmental community stands firmly against such a variance. I have written to each Committee member explaining why the chemical-industry approach is an unsound idea, and have

attached a copy of that communication to my statement for the record. Moreover, in the Committee's hearings of July 1982, we analyzed this issue and attached copies of an EPA document explaining why then-Administrator Anne Burford recommended against an Administration proposal on the subject (copy attached to this statement). And you have no doubt heard that Administrator Ruckelshaus has concluded that a similar variance for the pretreatment program is not feasible because the prerequisites of any successful national variance provision are missing.

Rather than catalogue and analyze the numerous problems presented by the chemical industry proposal, we present them here in summary form:

- The BAT-variance proposal presumes that BAT is an inflexible, economically perilous program that requires treatment of toxics beyond the needs of water quality. In fact, the opposite is true. BAT is an extremely flexible requirement which, in many cases, demands nothing of a source beyond existing permit limits, and which in all cases must be economically achievable for the industrial category. In defining BAT, EPA addresses only those sources and toxic pollutants of national concern, exempting all others for case-by-case treatment. And contrary to the myth spread by industry, BAT does not mandate a certain technology; EPA leaves each source free to meet BAT in

the most efficient means possible. In short, BAT is the best regulatory method that can be devised to address toxics problems without the delays and uncertainties inherent in a case-by-case, ambient approach.

* The BAT-variance proposal presumes that regulators can promptly define acceptable ambient water quality for dozens of toxic pollutants and then translate those levels into permit limits in hydrologically complex settings. As Mr. Ruckelshaus has pointed out in connection with the proposed pretreatment variance, this simply is not possible in the near term. Most states do not have standards for more than a few toxics, and EPA has predicted that nationwide we are at least a decade away from having the scientific benchmarks and analytical tools to process such a variance. Without this capability, a variance means long delays to debate and litigate the science of ambient water quality while chemical discharges continue uncontrolled by BAT. Existing experience under Sections 316 and 301(h) of the Act amply demonstrate the counterproductive delays of ambient variances.

* Given the flexibility and effectiveness of BAT, together with the difficulty of regulating on an ambient basis, the high resource costs of a variance provision would be completely out of proportion to any benefits of targeting pollution controls. EPA has estimated that at least 1200 work years would be required

over a two-year period to process variance requests, and has concluded that since so few plants would qualify, the net societal gain in developing such a system may be negative.

In sum, it makes no sense from either the standpoint of cost-effectiveness or the goals of the Act to adopt a BAT-variance provision. We urge the Committee to let the BAT program do its job in controlling toxics without the costs, delays, and inevitable water quality degradation caused by a new variance.

3. Fundamentally Different Fctors (FDF) Variances

We understand that EPA intends to seek an amendment that would provide new statutory variances from BAT effluent limitations -- even for toxic pollutants. As my colleague Ms. Dubrowski explained in her statement regarding the pretreatment program, this so-called "fundamentally different factors" (FDF) variance was created by EPA, without Congressional approval, in order to avoid the necessity of dealing with all relevant information during the ruelmaking process. Because the Third Circuit, relying on Section 301(l) of the Act, recently prohibited EPA from granting FDF variances from pretreatment standards for toxics, the Agency intends to seek your rubber stamp of approval for its misguided policy.

EPA's position represents the first and only breach of a longstanding policy of uniformity in regulating toxics under the Act. The Agency's request amounts to an admission that it is not

willing to do its job thoroughly and with the precision Congress expected -- preferring instead to defer the more complicated questions involved in setting BAT until the permit stage, and deferring in the process industry's compliance with important toxics controls. We urge you to keep EPA's feet to the fire, to make this Agency promulgate sound, comprehensive BAT limitations without its ill-conceived escape valve for toxic dischargers.

What's at stake here is the Act's system of regulating industrial sources through uniform rules that apply to classes and categories of dischargers. This system is a sensible, technology forcing approach that requires EPA to identify the "best" sources in a given category, and then to bring all other sources up to that level of control. The poorer performers obviously will have to make the most progress and expend the largest amount of rescurces in order to comply, and this often is because they have not upgraded their plant and treatment equipment over the years as other sources in their industry have done. In a nutshell, these poorer performers often are different from the rest of the industry in terms of many of the BAT "factors" specified in Section 304 -- raw waste loads, discharge volume, energy requirements, age and configuration of equipment and, of course, their cost of compliance -- but nevertheless can afford to comply with BAT without undue economic consequences.

In the 1977 amendments, Congress in effect upheld the Act's uniform system for toxics when it made the economic hardship variance of Section 301(c) unavailable for toxics pollutants. Section 301(c) essentially amounts to a re-examination of the BAT factors for an individual source that claims to be different -- in terms of economic capability -- from the rest of its category. Obviously, what makes a source less able to comply is the impact on its economic status of the factors that are relevant to determining BAT (the FDF variance factors). Having decided that, at least for toxics, industrial sources cannot escape from uniform BAT requirements because they find it economically difficult to comply, it would be ironic indeed for Congress to now permit the same result through examination of the underlying factors that contribute to that difficulty.

Under EPA's FDF procedure, the Act's technology forcing scheme, built on the concept of categorization, is severely undercut because the poorer performers can get special treatment. In practical and legal effect, such sources get the permit writers to conduct a mini-rulemaking procedure to define BAT for them on a case-by-case basis, and to issue a so-called "best professional judgment" (BPJ) permit. Their requirements are not pegged to the "best" performers in the industry because EPA's system makes the rest of industry irrelevant.

What's more, since the FDF variance is granted on the basis

of information "not considered" by EPA in the rulemaking, there is a strong incentive for these sources to withhold relevant information and set the stage for subsequent variance requests. Not only are poorer performers rewarded by this procedure, but EPA's ability to gather sound data on the industry is hampered and the resulting BAT regulations are less thorough, less timely and less defensible.

EPA contends that its BAT regulations are vulnerable to legal challenge without the FDF variance. We disagree. New Source Performance Standards are issued under Section 306 without any such variance, as the Supreme Court has required, and the Agency's ability to defend those categorical rules is unquestioned. Likewise, new-source pretreatment standards under Section 307(c) do not rely on this escape valve. Moreover, if EPA's existing regulations are challenged through petitions for reconsideration of the rules, the Agency can (and should) consider the need to adjust its categorization scheme to account for new and different situations (provided, of course, that the petitioning sources did not sleep on their rights during the first rulemaking). Indeed, EPA even has the option of creating subcategories containing one or a few sources, as it has done in several regulations (e.g., steel, ore mining, inorganic chemicals). Even this procedure is by far preferable to the FDF variance because the regulatory decisions are made by EPA

professionals at headquarters rather than permit writers in the field. In sum, the existing BAT regulations are not vulnerable so long as EPA does a thorough and responsive job.

One of the worst features of EPA's FDF procedure is the delay and resource burdens it can produce. As Ms. Dubrowski demonstrated in her statement, the time required to process a variance is extremely long and the exercise is very resource intensive. EPA itself, in a fairly recent memorandum, has estimated that processing a single variance will require 65 workdays, and "triple the resource requirements for each permit" even without considering the resources needed to defend the Agency's action in evidentiary hearings or court challenges. A significant number of variance requests, the memorandum concluded, "would serve to upset permitting priorities and [EPA's] ability to reduce the backlog of expired industrial permits." (Memo, dtd. Feb. 3, 1982 from the Acting Director, Office of Water Enforcement and Permits to the Acting Assistant Administrator for Water).

Hand in hand with these burdens go inordinate delays before dischargers achieve compliance. One of the best examples is the current controversy over FDF applications filed by two pulp and paper mills in Alaska. These mills should have achieved BPT in 1977, and yet here EPA is over six years later still considering their variance requests. It has taken nearly two years to

produce a tentative denial of the requests since EPA's Regional Administrator forwarded his recommendation to headquarters. This is the kind of process the Agency now asks Congress to approve.

Finally, EPA contends that the FDF provision is environmentally neutral because variances could be granted that require treatment more stringent than BAT. For two reasons, this simply is not the case. First, if EPA has evidence that it is possible for plants in a category to do better than BAT, the Agency has not chosen the proper BAT treatment system. EPA must peg BAT to the best level of performance that is economically achievable for plants in the category. Accordingly, when information is submitted indicating that plants can achieve more effluent reduction than the options under consideration in the rulemaking, it is EPA's responsibility to choose a better option. Second, if EPA does not receive such information in the rulemaking, it never will. Why should a facility come to EPA and point out that it is fundamentally different and ask for more stringent requirements? How are understaffed and overworked permit writers supposed to find these situations? And if EPA thinks environmental organizations or interested citizens have the resources, expertise and access to plant information necessary to uncover grounds for more stringent FDF variances, then the Agency has been deluding itself.

In short, the FDF variance proposal is a bad idea that flies

in the face of established Congressional policy. It should be rejected absolutely. Furthermore, if and when EPA puts forward recommended statutory language to implement its concepts, we would appreciate the opportunity to submit an analysis of the Agency's proposal for the record of these hearings.

Water Quality Standards and Second-Generation Toxics Controls

HR 3282 addresses two sets of issues of vital importance to the future of this Act: (1) the ground rules for setting state water quality standards; and (2) the need to move beyond BAT in targeting toxic "hot spots" of pollution that warrant more stringent controls. We regard each of these provisions as essential to the integrity of the Act and central to this Committee's agenda of amendments. Accordingly, we urge the Committee to support Chairman Howard's initiatives totally.

1. Water Quality Standards

EPA's regulations governing water quality standards have been an issue ever since the Agency proposed far reaching revisions in October 1982. This Committee and the Senate Committee have heard testimony from numerous witnesses regarding the impact of those changes. Chairman Roe has joined with the Senate leaders in seeking withdrawal of the proposal. Both the Senate Committee and Mr. Howard have proposed amendments that would prevent EPA from departing from the Act's policies and requirements, as carried out in previous EPA regulations.

This debate reached a climax of sorts last week when Administrator Ruckelshaus notified Chairman Roe and several Senators, by letter, that he intended to issue final regulations that responded to their earlier concerns and restored major portions of the EPA rules. The Administrator has set many things right in his recent regulations, and to his credit has overcome disasterous policy initiatives from elsewhere in the Administration. We have reviewed the Administrator's new rule and we applaud it because, for the most part, Mr. Ruckelshaus has been faithful to the Act and responsive to the public's concerns.

For their important oversight roles, Chairmen Roe and Howard deserve enormous credit and the public's appreciation. They have, in a very concrete and expeditious fashion, helped to produce an excellent result without resorting to actual legislation.

Where should Congress go from here? The Senate Committee leadership has said it will withdraw most of the proposed amendments that helped to precipitate EPA's recent action. But the agreement reached between Mr. Ruckelshaus and the Senate Committee leadership obviously applies only on the other side of the Capitol. Chairman Howard's proposals are pending here, and they merit your thorough consideration.

We believe there are two good reasons for this Committee to endorse the water quality provisions of HR 3282 and insist on

legislation in a conference with the Senate. With all due respect to Mr. Ruckelshaus, his regulations suffer from two serious flaws: (1) they do not offer the permanence and invulnerability to judicial interpretation that a statutory amendment would entail; and (2) substantively, they fall short of the mark in several important particulars.

Most important, if the EPA regulation reflects sound policy, as we agree it does in most respects, then its principal features should be clarified and made explicit in the Act itself. Nine national environmental organizations expressed their unified position on this point in a July 13, 1983 letter to Senate Committee members, copies of which were forwarded to Chairman Roe and Administrator Ruckelshaus (attached for the record). As we said then, these issues are questions of national policy for Congress to decide. They should not be left vulnerable to the whims of future regulators or the uncertainties of judicial reinterpretation, particularly in the context of possible negative implications created by Congressional consideration and inaction.

We find totally unpersuasive the Administrator's repeated assertion that legislation on these issues would hamper the ability of EPA and the states to deal with site-specific problems. If EPA intends that these regulations not be changed, we see no potential damage to their "flexibility" from codifying

20-955 O—84——136

the main features of the Agency's rules.

In addition, EPA's regulation does not include several important features found in HR 3282. First, unlike the EPA regulation, HR 3282 permits no degradation of high quality waters which constitute an outstanding national resource, such as the waters of national and state parks. EPA's rule would permit some degradation of these valuable resources.

Second, for other waters, HR 3282 would prevent degradation unless there is no feasible alternative and unless the state takes all practicable steps to minimize adverse effects on water quality. The Agency's regulation omits these important protections.

Third, HR 3282 would require that, where necessary, states must adopt numerical criteria for toxic pollutants of concern. A similar provision will be retained in the Senate Committee bill despite the withdrawal of most provisions on water quality standards. EPA's regulations, however, would permit states to utilize narrative toxics criteria (e.g., waters shall be "free from toxics in toxic amounts") instead of numerical standards. We believe this flexibility is unwarranted because narrative criteria must be implemented, if at all, through new biomonitoring techniques that are: useless to protect against human health hazards; virtually untried except in a handful of EPA experiments with extremely cooperative dischargers; and very

difficult to translate into needed treatment systems, process changes or other alterations that can promptly reduce toxicity. EPA's emphasis on biomonitoring and whole-effluent studies is a valuable and, we hope, promising technique for supplementing the traditional numerical approach, but we think it is an unacceptable substitute at this stage of its development.

2. Second-Generation Toxics Controls

As we near completion of the BAT strategy, it is time to begin preparations for the next generation of toxics control. BAT is a comprehensive, yet necessarily near-sighted toxics strategy; it addresses a wide spectrum of sources and pollutants, but because of scientific uncertainty never asks the tough question: how much of a toxic chemical can be permitted in the water without endangering human health or harming aquatic life? Once BAT is on the books, we must address this question in a carefully targeted and scientifically rigorous fashion. The answers might not be easy, but they must be sound for at least the most contaminated of our water resources: the toxic hotspots.

Where these hot spots are, and how badly they are polluted, have yet to be determined because no one has systemmatically conducted the necessary research and surveys. But EPA's half-hearted attempts, under authority of the NRDC v. Train toxics Consent Decree, have at least demonstrated that such areas almost

surely will exist even after BAT controls are in place. The Agency identified rivers and streams in or near 34 metropolitan areas where dilution studies showed a strong likelihood of problems. Some of these represented concentrations of industrial sources; others had a single, large source on a very small water body. Because of limitations in EPA's anlaytical methodology, we think the Agency only scratched the surface. Due to its inability to model hydrologically complex situations, for example, EPA ignored estuaries, where one might expect to encounter serious problems.

The Agency has continued some limited follow-up studies in a few of these areas, but to date has produced no regulatory or administrative strategy to address these problems. EPA's attitude seems to be governed by total deference to the states -- both to identify problem areas and control the responsible sources. That attitude represents business as usual, and business as it has been for over 10 years. We think it is time to make post-BAT toxics control a national priority, and to place the responsiblity in Mr. Ruckelshaus' hands to see that the job gets done.

For these reasons, we support the provisions of HR 3282 that would require actions to control toxics beyond BAT in those limited areas where it is shown to be necessary. HR 3282 does not provide new regulatory authorities; none are needed.

Instead, it requires EPA and the states to use the authority they have had for over 10 years, and to furnish the public some confidence that their waters are safe from toxic chemicals.

These provisions of HR 3282 essentially require four things. First, within one year, EPA (in cooperation with the states) must publish a list of all waters that will not have acceptable water quality (in terms of toxics) after implementation of BAT, and identify the sources and amounts of pollutants causing the problem in each area. Second, after one additional year, EPA must propose a control strategy for each problem area, using the authority of Section 302 or Section 303, that will reduce toxic discharges to acceptable levels. These strategies must be promulgated within 6 months thereafter. Third, all affected sources must comply with these strategies as soon as possible, but no later than three years after issuance of the final versions. Finally, EPA and the states must issue or modify all applicable permits under Section 402 to carry out the control strategies.

We think these are sensible and necessary steps. HR 3282 leaves the nature of each control strategy to be determined by the needs that arise in each instance. And it leaves the States an important partnership role with EPA in seeing that results are achieved. What HR 3282 does not do is leave the ultimate question of adequate toxics controls (and the timing of those

controls) to the competing budget and policy priorities of EPA and the States. The amendment elevates post-BAT controls to a very high priority, and concentrates the responsibility and accountability in the Administrator's hands. We urge the Committee to follow Chairman Howard's lead and make these important provisions a leading component of the House amendments.

EPA undoubtedly will emphasize that they have a "policy" (a draft policy at this point) of moving beyond BAT where someone determines it is necessary to issue more stringent permits. But a policy does not ensure results, especially among the states, and this policy does not ensure that anyone will do the anlaysis necessary to make such determinations. Moreover, where the necessary information is not available, EPA's policy calls for long-term monitoring and possible improvements the next time a permit is revised -- 5 or 10 years hence.

This policy direction by EPA is laudable, but it is not enough. EPA has the authority to move beyond BAT, and it has (or has recently begun to acquire) the motivation to take several important preliminary steps. What EPA does not have, but must have, is a Congressional mandate -- a set of requirements such as those contained in HR 3282 -- to get on with the job. We urge the Committee to accept nothing less than a firm, national program of post-BAT controls on toxics.

predicted last year that the scientific tools to decide BAT variances (water quality criteria and similar benchmarks for toxics) will take a decade to develop.[9]

E. BAT Variances Would Be Inordinately Expensive and Time Consuming.

Because any "environmental modification" requires detailed scientific scrutiny and extensive administrative processes, they tend to be very expensive and take a long time to complete. EPA estimates the government's personnel costs at 1200 work years per year just to process these variances, and predicts compliance for some industries in the 1990's. Similar experiences have been demonstrated under the existing S301(h) waiver for ocean outfalls.[10] EPA concludes that "the net societal gain ... may be negative."

Why should Congress start down such a lengthy, complex and costly road when the relief being afforded really is not necessary? We can't think of a single reason -- unless you intend to write legislative loopholes for the chemical industry.

---

[9] Our "Analysis of EPA Proposals To Amend the Clean Water Act" discusses the details of these problems.

[10] Fewer than 20 waivers decision have been made in over five years because the process is complex and because regulations and litigation took a very long time.

BAT

BACKGROUND

- The emphasis on toxic pollutants in the 1977 Clean Water Act reflected widespread concern that there were a large number of toxic chemicals being discharged to the water environment causing significant effects on human health and aquatic life. To some extent these concerns were based on a lack of information, and, to be on the safe side, Congress directed EPA to develop BAT guidelines for controlling the 65 chemicals and classes of chemicals in 21 major industrial categories.

TARGETING BAT

- The Agency has shifted its BAT strategy so that BAT guidelines that are more stringent than BPT are being developed for only a relatively small number of industries which discharge significant amounts of toxic pollutants. For example, the Iron and Steel industry will discharge 2,560,000 pounds of toxic pollutants per year if BAT controls are not implemented and at least twice that much will be discharged from the organics and plastics industry without BAT controls.

- For those industries and pollutants which are being targeted by the Agency for BAT guidelines more stringent than BPT, the Agency will ensure that the BAT limitations will be (1) economically achievable, (2) cost effective, and (3) necessary to reduce significant discharges of one or more toxic pollutants to remain if only BPT is implemented.

  Environmental impact assessments conducted by the Agency of proposed effluent guidelines indicated that this approach will result in significant water quality benefits. For instance, returning to the Iron and Steel example, our analysis of the major dischargers in this industry shows that about 75 percent of them will, by themselves, cause violations of applicable State water quality standards in the absence of BAT.

- The Agency now projects that eight industries will receive BAT guidelines more stringent than BPT. They are:

  The Agency is still in the preliminary stages of analysis for another three industries for which BAT may be required:

  The regulations' annual cost for the first set of industries is $80.6 million. Preliminary estimates of annual costs for the second set of industries and between $400-$700 million and that number is dominated by the costs to the organics and plastics industry ($325-$650 million).

July 20, 1983

Congressman James J. Howard
2245 Rayburn House Office Bldg.
Washington, D.C. 20515

Dear Congressman Howard:

We understand that you will be receiving letters or mailgrams from business interests in your district complaining about allegedly ineffective, inflexible and unnecessary federal regulations under the Clean Water Act to control pollution from industrial sources. These regulations, known as "BAT" because they require industries to use the "best available technology," are the very cornerstone of the national effort to curtail toxic water pollution. Stripped of the rhetoric, industry is asking you to support variances from these national toxics controls.

Environmental organizations strongly support the BAT program, and we want you to understand the other side of this variance issue. To begin with, a lot of responsible people have examined industry's position and rejected it as unsound and unnecessary:

* In a December 1982 Harris Survey, overwhelming majorities of the American Public supported BAT and opposed these variances: Over 80 percent believed sources of toxic pollutants that are dangerous to human health should not be granted any exception from BAT. And seventy-four percent said all factories discharging toxics should have to use the best technology they can afford.

* The Senate Committee on Environment and Public Works has heard industry's case for a BAT variance and rejected the notion in a bill marked up last month. Senator Chafee, Chairman of the Subcommittee on Environmental Pollution, said:

> [It] seems to me that a BAT waiver turns the Clean Water Act into an aquatic guessing game. To acknowledge that a waiver is an acceptable regulatory tool is to take a major step backward in the goals of the Act. A water quality-based approach to pollution control failed before 1972 and will fail again.

* * *

At a time when the agency's resources are diminishing, I expect that EPA would try to marshal these resources to get on with the job at hand rather than resurrect a policy that Congress judged to be a failure a decade ago.

* After considering industry's plea for toxics variances, EPA recently rejected the notion -- recommending against an Administration amendment in a memorandum to the President's Cabinet Council on Natural Resources and Environment. EPA's bottom line is that variances simply are not necessary:

BAT guidelines that are more stringent than [existing controls] are being developed for only a relatively small number of industries .... The Agency will ensure that the BAT limitations will be (1) economically achievable, (2) cost effective, and (3) necessary to reduce significant discharges of ... toxic pollutants .... Given the careful targeting of controls, few industries will qualify [for a variance] .... The net societal gain in developing a modification/exemption system may be negative.

We think the case against a BAT variance is very clear. We are concerned, however, because the catalyst for communications you will be receiving appears to be a misleading and factually incorrect package of information distributed by an organization calling itself Citizens for Effective Environmental Action Now (CEEAN). This is an industry group, based in Washington, that opposes the national strategy for toxics controls.

The CEEAN information is attached for your review, together with our analysis of its major flaws. The central problem with CEEAN's position is that it mischaracterizes the BAT-toxics program in several fundamental respects.

You will require reliable, responsible information on this issue in the months ahead. If you or your staff need a briefing on variances or other Clean Water Act questions, please call on us.

We look forward to working with you to reauthorize a strong, effective Clean Water Act.

Sincerely,

J. Taylor Banks

Analysis of CEEAN Position on BAT

1. CEEAN claims that BAT regulations are "ineffective and unnecessary."

According to EPA's estimates, BAT regulations will require the removal of over 100 million pounds of toxic materials, including carcinogens, from our waterways every year -- a reduction of over 65 percent of the toxics presently discharged by industries. The chemical industry desputes EPA's calculations, but still agrees that BAT will remove as much as 20 million pounds of toxics per year -- a significant improvement in industrial discharges. When one considers that many of these chemicals are dangerous at parts per million in the water, removing millions of pounds from wastestreams is an important accomplishment.

2. CEEAN claims that BAT will require "costly" new pollution control equipment.

By definition, BAT must be "economically achievable" for an industry. EPA must specifically consider the economic effects of each BAT rule -- plant closures, employment lost, price increase, market share, etc. -- and decide that industry can afford the costs. If industry cannot afford stringent controls, EPA cannot and does not impose them.

For example, the BAT rule for the following industries will impose no costs and have no economic impacts beyond existing requirements: Coal Mines, Leather Tanneries, Petroleum Refineries, Textile Mills and Timber Products Processors. Why? Because EPA found that the costs of more stringent controls either were too high or not worth it environmentally.

In some industries, where BAT is somewhat more stringent than existing controls, the economic impacts have been quite minor. For example, in the steel industry, EPA found that "the incremental costs associated with the regulation result in incremental short-run changes in price, market share, employment and production of about 0.6% or less ...." Similar small-scale impacts will result from other industry regulations.

3. CEEAN claims that BAT "in most cases will do little to improve the level of water quality."

This is absurd. You cannot remove millions of pounds of

toxic chemicals from industrial effluents each year without improving the quality of America's water resources. For example, EPA has said that without BAT, 75% of all steel mills in the country would violate state water quality standards.

4. CEEAN says that business will have to install BAT "by mid-1984".

CEEAN may be out of touch with current developments. The Clean Water Act presently has a July 1, 1984 deadline, but at least 4 bills are pending in Congress to extend that date into the 1986-88 time period. All sides -- environmentalists, EPA and industry -- have testified repeatedly that these extensions are needed. There is no doubt that the 1984 date will be delayed substantially, and even if these amendments are not enacted promptly, EPA is preparing to allow extensions administratively.

5. CEEAN claims that "many businesses" are "currently meeting national clean water standards."

The only national standards in effect now are so-called BPT regulations, "best practicable technology," the predecessor of BAT. These regulations were issued in the early 1970's and met by most of industry by 1977. By and large, BPT does not address toxic pollutants.

The only ambient standards under the Act are state water quality standards. To say that industry is meeting these also says almost nothing about toxics. Only about half the states have any numerical standards for toxics. Those that do usually cover only a handful of heavy metals -- nowhere near the 40+ chemicals covered by BAT -- and they almost never consider chronic toxic effects or human exposure through the food chain.

In short, BAT is the first comprehensive set of requirements for toxics. It is largely irrelevant to say that old federal and state standards are being met.

6. CEEAN claims that BAT will force businesses "to take out and replace their equipment".

BAT is an "add-on." These regulations require that sources take a reasonable step beyond the old BPT requirements -- usually by adding another process in the treatment system, reducing their water usage, or adopting in-plant changes and housekeeping measures to improve on existing equipment. If a company uses antiquated or obsolete treatment equipment that cannot meet BAT limits through add-ons, it might have to redesign its

facilities. But these instances would be rare if, indeed, they ever occur.

7. CEEAN insists that "business must have flexibility in determining which type of techniques will meet the standards and still be cost effective."

Under BAT, business has total flexibility in this regard. EPA does not prescribe technology; it sets numerical limits based on the performance of a known treatment system, but then allows each source to meet the numbers in any fashion. As the Deputy Administrator of EPA said in recent testimony, "technology-based" does not mean that the Agency prescribes the technology that must be used. Rather, EPA reviews the various treatment techniques presently in use or available in each industrial sector to determine what limitations are achievable using available methods. Once EPA adopts [BAT], each company or plant is free to use any method it chooses to achieve [BAT]."

8. CEEAN's bottom line: BAT should be applied case-by-case only where there is a problem.

The fatal flaw in this industry approach is that it cannot be carried out promptly and accurately. Because the states have almost no toxics standards, there currently is no uniform, reliable basis on which to determine whether an existing discharger protects health and the environment -- i.e., whether there is a "problem" in a particular waterway. The head of EPA's Office of Research and Development has predicted it may take at least 10 years to develop these benchmarks. That is why we have BAT -- to do something about the millions of pounds of toxics being discharged each year while scientists continue to struggle with the ultimate scientific benchmarks.

CEEAN Citizens for Effective Environmental Action Now

Toll Free Number (800) 322-CEAN

May 24, 1983

Dear California Manufacturer:

Once again, the federal government is attempting to force ineffective and unnecessary regulations onto the backs of California businesses like yours.

Unless Congress acts now, thousands of California businesses will be forced to purchase and install costly new pollution control equipment that in most cases will do little to improve the level of water quality achieved with current facilities.

By mid-1984, many businesses will be forced to upgrade their pollution control facilities to the "best available technology" (BAT), even though they are currently meeting national clean water standards with existing equipment.

We feel that those businesses which are meeting standards should not be forced to tear out and replace their equipment with new facilities that do not further enhance water purity.

Citizens for Effective Environmental Action Now (CEEAN) is a national industry group, asking individual businessmen to urge their Congressmen to revise the Clean Water Act's BAT regulations.

We have enclosed letters from the California Manufacturers Association and the San Jose Chamber of Commerce endorsing our position.

The California Manufacturers Association is exactly right in supporting an "appropriate and necessary level of control" but also recognizing that "if inflexible requirements are mandated, significant capital expenditures will result."

We're certain you can agree with the San Jose Chamber's statement that "businesses must have flexibility in determining which type of technology will meet the standards and still be cost effective."

Your own Congressman serves on the Congressional committee that will handle the Clean Water Act revisions this year. We will be sending the enclosed mailgram to Congressman urging him to consider our position on BAT.

We encourage you to join with the California Manufacturers Association and the San Jose Chamber of Commerce in supporting this effort and lend your name to the CEEAN mailgram.

Analysis of CEEAN Position on BAT

1. CEEAN claims that BAT regulations are "ineffective and unnecessary."

According to EPA's estimates, BAT regulations will require the removal of over 100 million pounds of toxic materials, including carcinogens, from our waterways every year -- a reduction of over 65 percent of the toxics presently discharged by industries. The chemical industry desputes EPA's calculations, but still agrees that BAT will remove as much as 20 million pounds of toxics per year -- a significant improvement in industrial discharges. When one considers that many of these chemicals are dangerous at parts per million in the water, removing millions of pounds from wastestreams is an important accomplishment.

2. CEEAN claims that BAT will require "costly" new pollution control equipment.

By definition, BAT must be "economically achievable" for an industry. EPA must specifically consider the economic effects of each BAT rule -- plant closures, employment lost, price increase, market share, etc. -- and decide that industry can afford the costs. If industry cannot afford stringent controls, EPA cannot and does not impose them.

For example, the BAT rule for the following industries will impose no costs and have no economic impacts beyond existing requirements: Coal Mines, Leather Tanneries, Petroleum Refineries, Textile Mills and Timber Products Processors. Why? Because EPA found that the costs of more stringent controls either were too high or not worth it environmentally.

In some industries, where BAT is somewhat more stringent than existing controls, the economic impacts have been quite minor. For example, in the steel industry, EPA found that "the incremental costs associated with the regulation result in incremental short-run changes in price, market share, employment and production of about 0.6% or less ...." Similar small-scale impacts will result from other industry regulations.

3. CEEAN claims that BAT "in most cases will do little to improve the level of water quality."

This is absurd. You cannot remove millions of pounds of

toxic chemicals from industrial effluents each year without improving the quality of America's water resources. For example, EPA has said that without BAT, 75% of all steel mills in the country would violate state water quality standards.

4. CEEAN says that business will have to install BAT "by mid-1984".

CEEAN may be out of touch with current developments. The Clean Water Act presently has a July 1, 1984 deadline, but at least 4 bills are pending in Congress to extend that date into the 1986-88 time period. All sides -- environmentalists, EPA and industry -- have testified repeatedly that these extensions are needed. There is no doubt that the 1984 date will be delayed substantially, and even if these amendments are not enacted promptly, EPA is preparing to allow extensions administratively.

5. CEEAN claims that "many businesses" are "currently meeting national clean water standards."

The only national standards in effect now are so-called BPT regulations, "best practicable technology," the predecessor of BAT. These regulations were issued in the early 1970's and met by most of industry by 1977. By and large, BPT does not address toxic pollutants.

The only ambient standards under the Act are state water quality standards. To say that industry is meeting these also says almost nothing about toxics. Only about half the states have any numerical standards for toxics. Those that do usually cover only a handful of heavy metals -- nowhere near the 40+ chemicals covered by BAT -- and they almost never consider chronic toxic effects or human exposure through the food chain.

In short, BAT is the first comprehensive set of requirements for toxics. It is largely irrelevant to say that old federal and state standards are being met.

6. CEEAN claims that BAT will force businesses "to take out and replace their equipment".

BAT is an "add-on." These regulations require that sources take a reasonable step beyond the old BPT requirements -- usually by adding another process in the treatment system, reducing their water usage, or adopting in-plant changes and housekeeping measures to improve on existing equipment. If a company uses antiquated or obsolete treatment equipment that cannot meet BAT limits through add-ons, it might have to redesign its

facilities. But these instances would be rare if, indeed, they ever occur.

7. CEEAN insists that "business must have flexibility in determining which type of techniques will meet the standards and still be cost effective."

Under BAT, business has total flexibility in this regard. EPA does not prescribe technology; it sets numerical limits based on the performance of a known treatment system, but then allows each source to meet the numbers in any fashion. As the Deputy Administrator of EPA said in recent testimony, "technology-based" does not mean that the Agency prescribes the technology that must be used. Rather, EPA reviews the various treatment techniques presently in use or available in each industrial sector to determine what limitations are achievable using available methods. Once EPA adopts [BAT], each company or plant is free to use any method it chooses to achieve [BAT]."

8. CEEAN's bottom line: BAT should be applied case-by-case only where there is a problem.

The fatal flaw in this industry approach is that it cannot be carried out promptly and accurately. Because the states have almost no toxics standards, there currently is no uniform, reliable basis on which to determine whether an existing discharger protects health and the environment -- i.e., whether there is a "problem" in a particular waterway. The head of EPA's Office of Research and Development has predicted it may take at least 10 years to develop these benchmarks. That is why we have BAT -- to do something about the millions of pounds of toxics being discharged each year while scientists continue to struggle with the ultimate scientific benchmarks.

Gentlemen:

We strongly endorse the Committee's proposal for amending the Clean Water Act regarding water quality standards, and see no reason for retreating a single step. Through your March 14, 1983 letter to Dr. Hernandez urging the withdrawal of EPA's proposed regulations, you established a strong position of Congressional leadership on this important issue. Now, the Committee's amendments place the Senate in a position to guarantee that EPA steers the proper course for its water quality standards program.

Administrator Ruckelshaus intends to issue a final regulation that he hopes you will accept in lieu of legislation, and has cited the need for administrative flexibility as his principal concern. With all due respect to the Administrator, we doubt that the Committee proposal undercuts any need for flexibility, and have seen no evidence of how the bill could inhibit EPA's efforts to achieve clean water. As you know, the existing rules have proved flexible enough to allow needed adjustments in state water quality standards.

The provisions of your bill are sound, as EPA's silence thus far surely concedes, and they should become the law of the land, not merely regulations. The bill addresses itself to matters of

national policy on which it is important for Congress to clarify its intentions. These issues are Congress's to decide; their resolution should not be left to inter-agency negotiations.

As Senator Chafee and others have observed, the critical difference between laws and rules is that where the law is specific and clear, it cannot be changed or reinterpreted by a future Administrator or OMB. This concern about regulatory "reform" has a sobering basis in recent experience, as the EPA regulations of the 1970's have been eroded over the past two years. In the water area alone, we have seen actual or attempted retreats in at least five key areas: pretreatment removal credits, anti-backsliding, NEPA implementation, new-source controls, and the toxic hot-spots program. We have no doubt that Mr. Ruckelshaus is a man of his word, but he will not be at EPA indefinitely, and we cannot assume that the important policies in the Committee bill would be preserved in his absence.

We are equally concerned, however, about the Administrator's ability to defend a regulation in the face of any ambiguity as to Congressional intent. Each of you appreciates that when Mr. Ruckelshaus' regulation is reviewed by a U.S. Court of Appeals, it must be sustained and properly interpreted by the judiciary on the basis of provisions in the Clean Water Act and Congress's expressions of legislative intent -- both direct and by implication. We think it is essential to bear in mind the potential effects on the legislative history of withdrawing the Committee's proposal so as to accommodate regulations that may differ in any important respect from the policies on which you have taken a stand. Such a negative implication would be an extremely high price to pay for administrative flexibility.

With this concern in mind, we set forth below a list of what we believe are the most important issues. Each of these principles is rooted firmly in the Committee bill.

1. Mandatory Numerical Toxics Criteria

The Committee bill directs each state to develop numerical criteria for those toxic pollutants that could harm human health and aquatic life, or otherwise interfere with attaining water quality goals for a given water body. This approach is the very cornerstone of the Committee's toxic hot-spots initiative.

EPA would prefer to allow the states a choice between numerical criteria and narrative statements (e.g., "free from toxics in toxic amounts") that would be implemented, if at all, through biomonitoring techniques. EPA staff have admitted to the

Committee staff that such techniques: never have been used to issue and enforce a single permit; are useless for human health protection; and have not been demonstrated in the field to the point where regulatory reliability and costs are well established. As we understand it, these are the reasons why the Committee bill merely authorizes biomonitoring as a supplemental tool in the water quality standards program.

2. Mandatory Upgrading of Standards

The Committee bill codifies existing EPA regulatory provisions for upgrading a use designation whenever it is less protective or beneficial than those uses presently attained in a particular water body. The bill also requires the state to adopt new or additional criteria for the protection of existing uses. These essential provisions were not included in EPA's proposal.

3. Restrictions on Downgrading Standards.

The Committee bill allows downgrading (adoption of less beneficial uses) only in the narrow circumstances provided by existing EPA regulations (natural background, irretrievable levels of pollution, or severe economic hardship). As you emphasized in your March 14, 1983 letter to Dr. Hernandez, EPA and OMB prefer to depart from at least three of the Committee's policies.

First, attainment costs must be considered in terms of economic impacts, not cost-benefit comparisons as OMB would prefer. The Committee bill (as well as existing EPA regulations) would allow downgrading where attaining the existing standard would require controls beyond BAT and "result in substantial and widespread adverse social and economic impact." As we read the Act, this is what Congress always intended; clean water shall be achieved unless severe economic harm would result. EPA's proposal -- to which your letter objected -- would substitute a cost-benefit comparison for this economic test. The EPA regulation would eliminate the Congress's judgment that clean water is our national goal. It would allow states to re-examine whether clean water is desirable, and to base these decisions on crude, expensive, politically vulnerable assessments. This is a bad idea, and one which you should continue to reject.

Second, downgrading must not be allowed where physical characteristics, rather than water quality, affect people's ability to use America's waters. As you noted in your letter, a river's swift currents or congested traffic should not furnish an excuse to give up on maintaining or improving the quality of its

water. Similarly, shallow conditions, rapids, channelization, temperature or other characteristics may reduce a waterway's suitability or accessibilitiy for canoeing or swimmming, but prudence dictates maintaining good water quality. The Committee bill is satisfactory on this point. EPA's proposed regulation is not.

Third, the Committee bill makes clear that states may not designate any waters for use as "waste transport" -- i.e., open sewers. Astonishing as it may seem, some states are considering just such a move. EPA's regulation does not prohibit these practices.

4. Anti-Degradation.

The Committee's provision on anti-degradation closely follows EPA's existing regulation, but adds several important provisions to protect high quality waters. First, when a state decides to allow degradation, it must find that there are no feasible and prudent alternatives to the pollution impacts, and must require all practicable measures to reduce or offset the damaging water quality effects. We think these are common-sense, minimum requirements when deciding to degrade the finest waters in the country. Second, the bill requires that States provide an adequate margin of safety to ensure that their standards are satisfied even if water quality degradation is allowed. This provision properly places the responsiblity on the state to permit only such degradation as can be justified in view of the ever-present scientific uncertainty associated with such decisions.

5. Miscellaneous Provisions.

EPA's proposal contains many other problems that must be examined in detail if Administrator Ruckelshaus issues a new regulation. For example, the EPA proposal affects public participation, low-flow exemptions, periodic state reviews of all waters, state-issued variances from treatment requirements, and the EPA review and approval process. Some of these could have major detrimental impacts on water quality and on the administration of state programs.

* * *

Your March 14 letter and the Committee bill are desparately needed initiatives on these important policies. Nearly 800 individuals and 230 environmental organizations around the country commented on EPA's proposal; many expressed the same

alarm and concern we feel about the prospects of retreating on water quality in the name of flexibility. And at least 17 states, whose flexibility EPA purports to be enhancing, have raised serious objections to the proposal.

The importance of these issues requires your close attention and collective wisdom in the days ahead. We urge you to stand firm in your resolve to take the lead in deciding the national policy for clean water, and in eliminating the possibility of any weakening "reforms" in the future. We would be pleased to meet with you to discuss your plans and answer any questions you might have.

TESTIMONY OF

FRANCES DUBROWSKI

SENIOR ATTORNEY

NATURAL RESOURCES DEFENSE COUNCIL, INC.

BEFORE THE HOUSE SUBCOMMITTEE

ON WATER RESOURCES

ON

"THE CLEAN WATER ACT'S PRETREATMENT PROGRAM"

NOVEMBER 9, 1983

Mr. Chairman and members of the Subcommittee, it is a pleasure to be invited to testify here today. When we testified before this Subcommittee last year, we emphasized that the national pretreatment program is one of the Clean Water Act's most important programs for controlling toxic pollutants. More than half, or 60,000 of the nation's industrial polluters, dump their wastewaters in municipal sewage treatment plants.

At least 93 chemicals, including such well-known toxics as lead, mercury, cyanide, and arsenic have been found in these wastewaters. (Table I of these comments describes the adverse health effects of some of the more well-known toxics detected in POTW effluent samples.)

Toxic wastes cause three alarming problems in municipal plants. First, community plants are designed to treat conventional pollutants, not toxics. Toxics often pass through the plant, causing the same health and environmental damage as if they were dumped directly into a waterway.

Second, toxic wastes can destroy a community's huge investment in a sewage treatment plant. They can interfere with a plant's sensitive biological processes, impairing treatment of industrial wastes as well as the much greater volume of community wastewaters. They can affect the structural integrity of the plant, corroding pipes and other equipment. They can expose municipal workers to highly toxic fumes, producing nausea; dizziness; and eye, nose and throat, and skin irritation. In extreme cases, they have exploded the treatment works and its sewer system.

Finally, toxic chemicals concentrate in the sludge wastes produced by a treatment facility. Contaminated sludge is more expensive to dispose of, especially the large volumes generated by municipal plants. If improperly disposed of, the chemicals in the sludge will seep out into groundwater and drinking water supplies, permeate the soil where they can be taken up into the plants we eat, or become air pollutants when the sludge is incinerated.

For these reasons, Congress enacted a national program requiring pretreatment of industrial wastes before they enter municipal plants.

Last year, we pointed out that the pretreatment program had reached a critical turning point. After a decade of data-gathering and bureaucratic foot-dragging, the program was about to accomplish its goals. Developments since that time have proved that statement to be true. EPA has now proposed or promulgated twenty national categorical pretreatment standards. Together, these standards will eliminate over 200 million pounds of toxic pollutants from POTW influent each year.

The general pretreatment regulations, which establish the basic structure of the program, are also finally in place. They were issued by EPA in January 1981 after an NRDC lawsuit spurring EPA into motion and four years of subsequent internal agency review. In September of this year, the U.S. Court of Appeals for the Third Circuit upheld the rules in all major respects but one -- the Court agreed with NRDC that the "FDF" or "fundamentally

different factors" variance violated Congress' intent that toxic pollutants be strictly controlled.* National Association of Metal Finishers, et al. v. EPA, No. 79-2256, September 20, 1983.

With the federal regulations in place, modest progress is being made at the local level. Over 100 POTWs have obtained EPA's approval for local programs which comply with federal regulations; many more are on the way to doing so. Over 64% of the POTWs have now performed an industrial waste survey to identify the sources, amount, and characteristics of their industrial influent, a necessary first step to effective pollution control.

In spite of this progress, much remains to be done. We urge Congress to maintain the pressure for fuller pretreatment of toxic pollutants.

Our testimony today will address three proposals for changes to the pretreatment program which have been, or will likely be, put before this Committee. Each proposal would seriously undercut the toxic pollution protection afforded by the pretreatment program; each should be rejected by the Committee.

---

* The Court also remanded three definitions -- those of "interference," "pass through," and "new sources" -- to EPA.

1. "FDF" or "Fundamentally Different Factors" Variances for Toxics.

When Congress reauthorized the Clean Water Act in 1977, it placed special emphasis on the control of toxic pollutants. Consistent with this overall direction, Congress specified in Section 301(l) of the Act that EPA could not grant modifications (i.e., "variances" or "waivers") from pretreatment standards set for certain listed toxic pollutants.*

This provision made sense: it placed a premium on speed and uniformity. Those with information about the economics or technology of pollution control who wanted to influence the development of a standard had an obligation to place the information promptly before EPA. To facilitate standard-setting, EPA would consider all relevant information at once, thereby minimizing the expenditure of administrative resources and the need for re-review of the standards. Once the standards were in place, EPA, the affected industries and the public could turn their attention and resources toward ensuring compliance; they would not be distracted by attempts to relitigate questions of economic or technological feasibility, by applications for waivers based on grounds irrelevant to the Congressional scheme, or by other dilatory tactics.

Uniformity, too, would be enhanced. A single group of experts at EPA would set the standards, rather than scattered

---

* 1977 Leg. Hist. at 328-31 (statement of Rep. Roberts); id. at 458 (statement of Sen. Muskie).

regional, state and local officials acting on variance applications for individual plants. A single Circuit Court of Appeals would decide a judicial challenge, avoiding the potentially inconsistent results that could emerge from plant-by-plant and court-by-court review. Thus, industries embarking on a compliance program could rest assured that competitors would not achieve a more favorable result by extending appeals to different decision-makers.

This scheme offered industry certainty, while still preserving flexibility to respond to a developing data base. If new information bearing upon the standards later came to light, an affected industry could petition EPA to consider the new facts, or it could seek judicial review of the standards under Section 509(b) of the Clean Water Act -- but only if the industry could not have brought the information to EPA's attention during the original standard-setting proceeding.

This scheme, of course, put pressure on EPA to do the job intended by Congress. EPA could not avoid the hard questions; it could not neglect to consider critical information, postponing its decisions on some sources or types of facilities until another day.

Not content with Congress' scheme, EPA invented one of its own. It asserted that the Administrator "in his discretion" could permit variances from the pretreatment standards whenever "fundamentally difference factors" from those considered by the Administrator were present (the "FDF" variance).

EPA identified six factors which might be considered fundamentally different:

1) the nature or quality of pollutants in the raw waste load;
2) the volume of the discharge;
3) non-water quality environmental impact of control and treatment;
4) energy requirements of control and treatment;
5) age, size, land availability and configuration, processes employed, process changes, and engineering aspects of the application of control technology; and
6) cost of compliance.

These factors were virtually identical to those which EPA had to consider in setting the BPT or BAT-level pretreatment standards themselves.* In other words, the variance provision allowed EPA to postpone the BPT or BAT decision-making process (while still enabling EPA to claim that it had complied with its standard-setting deadlines).

---

* Section 304(b) of the Clean Water Act told EPA to consider "the age of equipment and facilities involved, the process employed, the engineering aspects of the application of various types of control techniques, process changes, the cost of achieving such effluent reduction, non-water quality environmental impact (including energy requirements), and such other factors as the Administrator deems appropriate" in setting BAT-level standards. In addition, the Administrator had to consider "the total cost of application of technology in relation to the effluent reduction benefits to be achieved" when setting BPT-level standards.

EPA claimed that the variance would come into play where either information affecting the pretreatment standards "will not be available", or where this information "will not be considered" by EPA in setting the national standards.* In neither case is a variance needed; indeed, in both cases the existence of a variance poses a danger to the integrity of the rulemaking. If information on the applicability of the pretreatment standards to specific plants is "not available," it is most likely because individual plants failed to supply critical information to EPA during the standard-setting process.** If so, there is no sound reason for rewarding these plants with a "second bite at the apple" in a separate variance proceeding. Likewise, if information is not "considered," it can only be because EPA failed to respond adequately to the comments or data it received during the rulemaking. In this case, however, EPA would be extremely vulnerable to a lawsuit challenging the standards as "arbitrary and capricious" under the Administrative Procedure Act.

In addition, the existence of a variance thwarts key elements of Congress' scheme for strict control of toxic pollutants -- because it has the potential to delay the standard-

---

* EPA's general pretreatment regulations, 46 Fed. Reg. 9455 (January 28, 1981).

** Information may also not be "available" because it does not exist and can only be developed at a later date. If so, however, Section 509(b) of the Clean Water Act, as noted earlier, already gives individual plants all the relief they would need to seek a new pretreatment standard.

setting process for individual plants and because it destroys the uniformity of the standards.

A delay of almost a year in the best of cases -- considerably more on the average -- is entailed in undertaking the steps needed to process and approve or deny variance applications. EPA's general pretreatment regulations outlined the following minimal steps:

- 180 days from the effective date of the standard (longer if a "category determination request" is made) to submit a variance application
- an indeterminate amount of time from receipt of the application until the public is notified of a pending request
- 30 days or more for public comment on the application
- an indeterminate amount of time for the State or the Regional enforcement division director to make a decision on the variance request
- 30 days from the decision of the Regional enforcement division director to request a hearing by the Regional Administrator

- an indeterminate amount of time for the Regional Administrator to decide whether to hold a hearing
- 30 days to appeal to the Administrator if the Regional Administrator fails to hold a hearing
- an indeterminate amount of time to conduct a hearing and decide the variance request.

While sources would still be under an obligation to comply with the pretreatment standards while their variance applications were being decided, many might choose not to do so, gambling on a favorable outcome. Thus, the variance will impair the voluntary compliance needed to make the pretreatment program a success.

Each variance application will also consume considerable administrative resources. Now EPA headquarters personnel (or consultants working under their direct supervision) collect and analyze the comprehensive data base for each pretreatment standard. If variances were allowed, state and regional EPA personnel would have to duplicate the analytical task. Their decisions might well differ from one area of the country to another, creating inequities never anticipated by Congress. For these reasons, Congress clearly prohibited variances for toxics in the 1977 Clean Water Act, and the courts upheld the choice.

A variety of arguments are now being offered to persuade Congress to reverse its policy for toxics control. None withstands analysis.

EPA claims, for example, that a variance will reduce the time and cost of setting pretreatment standards. The reverse is true. The standards are "set" when each regulated facility, including the controversial ones, knows the limits which will apply to it. When this process is splintered into several piecemeal rulemaking proceedings, delay and duplication of effort are inevitable. Thus, over the long run, the cost and time of standard-setting increases.

A variance does not even simplify the first phase, standard-setting for the bulk of an industrial category. Individual plant and process differences inevitably crop up, precipitating the creation of separate subcategories. EPA, for example, is considering a separate subcategory for new platinum ore mines and mills, even though only one plant would fit the subcategory; EPA created a separate subcategory for iron blast furnaces even though only two plants fit the subcategory.

Individual plant and process differences account, at least in part, for the weak standards EPA issues for entire industrial categories. For example, EPA recently issued pretreatment standards for the metal finishing category. It found that individual metal finishers differed considerably in the total toxic organic control they could achieve; those which performed both solvent degreasing and painting had a higher raw waste load than any other process group. EPA nevertheless based its limits for the entire metal finishing category on the processes with the highest raw waste load, giving plants which did not perform both

20-955 O—84——138

operations a windfall in terms of their pollution control obligations.

Likewise, EPA determined that metal finishers, all of whom are covered by the earlier electroplating standards, could meet the total toxic organic limits for metal finishing with the end-of-pipe electroplating treatment due by June 1984. Nevertheless, EPA gave metal finishers a February 1986 compliance deadline "in case additional process streams present special compliance problems." Since EPA already builds a contingency factor into its standards for individualized compliance problems, it does not need a variance to give industry further regulatory relief.

EPA also claims that a variance is not a "loophole" in the statutory scheme. That statement, too, lacks credibility. It is true, as EPA asserts, that citizens could use the variance procedure constructed by EPA to obtain stricter toxic pollution controls. But that possibility is more theoretical than real. Ordinary citizens could only substantiate a call for a stricter individual plant standard by reference to the specific engineering or economic advantages of a particular facility; they, unlike plant managers, are unlikely to have this information.

More often, a variance will be used to relax standards. All pending variance applications were filed by industries seeking waivers from their compliance obligations. Many reargue the merits of either EPA regulations or Clean Water Act provisions. For example, General Motors filed 27 variance

applications for electroplating facilities. All 27 applications challenge the application of the pretreatment regulations' combined wastestream formula, recently upheld by the Third Circuit Court of Appeals.

Eighteen of the applications seek extensions of the Clean Water Act's three-year compliance deadline. Some of these do not schedule the commencement of prelimary design or engineering until at least two and one half years after the regulations were promulgated. For example, the Fisher Body Division, Detroit Fort Plant states it will "begin Engineering Evaluation to develop solutions for achieving compliance" by September 1983. The Worldwide Truck and Bus Division, Indianapolis Plant states it will submit an "Appropriation Request for Engineering Study" by August 1983.

These applications do not explain why the plants in question could not commence preliminary design or engineering any earlier. We can think of no reason why this should be so. We do know, however, that General Motors has been actively involved in litigation contesting EPA's regulations. We conclude that General Motors waited until it had exhausted all litigation opportunities, and is now using the variance procedure to try to get EPA to ratify its decision to postpone compliance.

If Congress creates a variance procedure, it will open the way for backdoor challenges to EPA's regulations and the statutory scheme. We urge the Subcommittee to refrain from adding an FDF variance procedure to the law.

2. Local program "waivers."

Some have also suggested that the pretreatment program could be improved by adding a "local waiver" provision. Under a local waiver, qualifying POTWs could obtain exemptions from the national pretreatment program. Industrial users, in turn, would no longer have to comply with national categorical pretreatment standards; they would be bound only by locally developed limits on their discharges.

A variety of provisions have been drafted to accomplish this goal, some more carefully than others. Under the more thoroughly considered proposals, a qualifying POTW could only obtain a local waiver if it:

1. had completed an industrial waste survey and obtained EPA approval of its pretreatment program;

2. met secondary treatment requirements;

3. enforced numerical limits for toxic pollutants entering the POTW;

4. met water quality standards for each of the toxic pollutants exiting the POTW; and

5. safely disposed of its sludge.

Initially, EPA would determine the pollutants to be covered and the monitoring requirements for their detection. A qualifying POTW could then apply for, and obtain from EPA, a two year stay of enforcement of the national categorical pretreatment standards. At the end of the two years, the POTW would submit a complete application for approval of its waiver. EPA would have

60 days to approve or deny the application.

The Senate Environment and Public Works Committee foresaw serious problems implementing a waiver, even under the more carefully drafted proposals, and ultimately deleted such a provision from the bill reported out of Committee. We urge this Subcommittee to reject the proposal as well. The waiver is premised on the notion that questions about eligibility can be resolved quickly, freeing qualifying POTWs to proceed with their local programs and keeping disruption of the remainder of the program to a minimum. But any number of events could disrupt this carefully constructed scenario. For example, if EPA failed to promulgate the initial guidelines on time, POTWs would not be able to develop their applications and the entire program would be thrown into confusion. This concern is not unfounded since EPA's track record of adhering to statutory deadlines leaves much to be desired.

Even if EPA met its initial deadlines, an aggrieved party could still challenge EPA's guidelines in court, creating uncertainty about program requirements. If a court subsequently agreed with the litigant, the program could be significantly disrupted years after enactment of the Clean Water Act Amendments of 1983 or 1984.

The problems do not end there. What if EPA and the POTW disagree on whether a local program qualifies for a stay of enforcement? During the years it takes for litigation to unfold, what obligations does the industrial user meet -- the federal or

local standard? The two standards may have different but nonetheless significant financial implications for the industrial user. If local numbers are less stringent, many industrial users may decide to cast their lot with the POTW, taking their chances on the outcome of any lawsuit. The job of enforcing the federal standards would then be considerably complicated.

The same problems arise if EPA decides to deny the final application for program approval or to establish conditions on a grant of approval which may be unacceptable to the POTW. Indeed, the short time allowed for review and approval of a POTW's application leaves EPA and local government with little room to resolve their differences.

In short, we question whether a waiver provision is workable. Enactment of a waiver may only postpone the day when adequate pretreatment standards are in place in the majority of POTWs with significant industrial influent.

A second and related concern is whether waivers will provide the same level of protection against toxics as the national program. The waiver will be of little use to POTWs with numbers more stringent than the national categorical pretreatment standards. Section 510 of the Clean Water Act already protects those numbers from changes merely because EPA promulgates less stringent pretreatment standards. Instead, it is the POTWs with the more relaxed standards which will be pressured by industrial users to obtain a waiver from the federal program.

A POTW facing this pressure need only show that it complies with secondary treatment requirements and that it has an approved local pretreatment program in order to qualify for the two year stay of enforcement. No one knows precisely how many POTWs can meet this test, but the number is potentially large. Over 1,400 POTWs have installed secondary treatment -- more than half of the plants that are required to develop a pretreatment program.* A much smaller number have received EPA program approval. But many have either completed their applications or taken at least some of the steps needed to obtain EPA approval. In fact, an EPA consultant concluded over one year ago that 79% of the POTWs with a flow greater than 5 mgd have made "substantial progress" toward obtaining program approval, and another 45% of the smaller POTWs required to develop a local program have made similar progress. If EPA continues to work with local municipalities, many POTWs will be in a position to obtain program approval by enactment of the Clean Water Act Amendments of 1983 or 1984.

These POTWs will then face a considerable task developing the local program requirements necessary to obtain a waiver from the federal program. They will have to develop water quality standards, often from scratch, to assure that toxics are not

---

* Many of these POTWs may not qualify for a waiver because they are still not meeting their NPDES permit limits. Seventy percent of POTWs violate their permits, half more than 10% of the time. Many of these plants have become obsolete or overloaded. Others experience recurring operation and maintenance problems; over seventy percent of the plants in this category attribute at least some part of the problem to industrial influent. Thus, the task of sorting out which POTWs actually comply with §301 of the law will not be an easy one.

simply passing through the POTW in dangerous amounts. The states have done little to assist them in this effort in the decade since the Clean Water Act was passed. For example, lead, cyanide, and cadmium are the most heavily regulated pollutants in waterways, but only 16 states have issued water quality standards for them. Other pollutants are less frequently addressed; only six states have water quality standards for silver. Thus, eligible POTWs will generally have to rely upon site-specific numbers developed especially for the waiver application

The task of determing what constitutes a "safe" method of sludge disposal will not be easier. The cities most likely to be interested in an "opt-out", those with many industrial users, are also those most likely to have a sludge contamination problem. The exact magnitude of this problem is difficult to estimate since as many as 30% of the POTWs may not have even sampled their sludge. But in one EPA study of 40 well-operated POTWs, 24 priority pollutants were detected in more than 50% of the sludge samples. Some -- such as copper, lead, silver, and zinc, -- appeared in all sludge samples. The concentration range of these pollutants was considerable; toxics reached concentrations as high as nine million ug/l.

Federal benchmarks to guide the disposal of contaminated sludge are virtually nonexistent. EPA has developed regulations for cadmium and PCBs applied to land, especially on food-producing crops. An EPA study concedes that at least seven other metals as well as toxic organics can be considered "contaminants

of concern" in land application of sludge. But the guideline-setting process for these pollutants has not yet been initiated. Nor is EPA any further along in developing guidelines for distribution and marketing of sludge, even though such practices go on uncontrolled in almost all states. So POTWs will have to sample their sludge, identify the toxics of concern, determine what adverse effects to anticipate from these pollutants, establish concentration limits which protect against these effects, and determine whether different methods of disposal alter their concentration limits.

As you can see, much of the information necessary to determine the adequacy of a local program will have to be developed on a case-by-case basis for the waiver application. We doubt that POTWs have the resources to generate adequate data within the short time frame contemplated by the waiver bills. And, even more important, EPA lacks the ability to review and approve these applications within 60 days.

Lengthening the review process will only extend the period of uncertainty and program disruption generated by the existence of a waiver. But pressing local governments, states, and EPA to do the job within an unrealistic time frame means that the review process is likely to degenerate into a paper-pushing exercise, offering only the illusion of control.

Finally, the resources needed to administer a waiver program would be substantial. An internal EPA analysis concluded that $13.5 million would be needed in FY 84 and another $13.5 million

in FY 85 to process waivers if 600 POTWs applied. If the initial screening test is relaxed, then even more POTWs could apply for waivers, and the cost of processing applications would increase accordingly.

This is a high price to pay for flexibility, particularly when EPA has yet to develop long overdue categorical pretreatment standards and sludge disposal regulations. We urge the Committee to direct EPA to put its resources into programs which will protect public health and the environment, rather than into a waiver program which may well undermine the adequacy of pretreatment efforts nationwide.

3. Special provisions for "integrated facilities."

Since 1978, EPA's pretreatment regulations have contained a "combined waste stream formula" designed to fit "integrated facilities" (i.e., those which choose to combine waste streams from several industrial categories) into the category-by-category regulatory approach of the pretreatment program. The formula enables a facility to adjust the discharge limit set by a categorical pretreatment standard whenever the waste stream regulated by that standard is combined with wastes which are either regulated by another categorical standard or not regulated at all.

The formula recognizes that diversified industrial facilities may have many reasons for combining waste streams (e.g., cost-efficiency, space-saving, or engineering reasons).Not all combined waste streams represent sound engineering or

economics, however. Some avoid treatment of toxic pollutants through dilution. For example, if a waste stream with a high concentration of a pollutant is mixed with another waste stream which does not contain that pollutant, or which contains it only at low concentrations, the addition of the second waste stream would dilute the pollutant but would not remove or treat it. In other cases, components of one waste stream may inhibit treatment of toxic pollutants in another.

EPA's formula gives integrated facilities flexibility to keep separate but compatible waste streams together. The formula does not, however, permit <u>any</u> combination of waste streams. Combinations which would prove to be incompatible for treatment purposes or which would dilute waste streams without treatment are disallowed.

The U.S. Court of Appeals for the Third Circuit recently completed an exhaustive examination of the formula and concluded that the Administrator, charged with the complicated task of regulating a vast array of indirect dischargers within specified time limits, made a rational choice in selecting the formula. Now, some industrial facilities propose that the Clean Water Act be amended to give special treatment to integrated facilities. They suggest that integrated facilities have some extension of the law's compliance deadline. (Some would go so far as to suggest that integrated facilities face no compliance obligations until <u>all</u> of the categorical pretreatment standards are in place).

This proposal should be resisted because:

- The combined waste stream formula makes sense.

It allows integrated facilities to keep waste streams from several processes together as long as the waste streams are compatible for treatment purposes. The original formula was substantially revised, at industry's request, to provide flexibility while preventing sources from avoiding toxic pollution controls through dilution or through combinations of waste streams which reduce the efficiency of the best pollution control technology for toxics.

- Repeal of the formula would delay important toxic pollutant controls.

Electroplating facilities -- sources of such well-known toxics as lead, cadmium, cyanide, copper, nickel, chromium, and zinc -- must meet categorical pretreatment standards by June 1984. Repeal of the formula would allow integrated electroplaters to postpone compliance until three years after the last categorical pretreatment standards are in place (1987 or later).

- Repeal of the formula would create economic disparity between facilities in the same industrial category.

Nonintegrated electroplating facilities must meet categorical pretreatment standards in 1984. As EPA told the Third Circuit Court of Appeals: "Allowing integrated facilities an additional year and one-half to come into compliance might place the smaller and more financially vulnerable nonintegrated facilities at an unjustifiable competitive disadvantage."

- Repeal of the formula could have far-reaching consequences for EPA's entire pretreatment program, delaying categorical standards that have taken a decade to develop.

The combined waste stream formula, by its very nature, applies not only to electroplaters, but also to other industries which combine wastes from several processes. Categorical pretreatment standards have recently been issued or proposed for eighteen other industries besides electroplaters. Repeal of the formula may require EPA to subdivide these industrial categories or otherwise redo portions of the rulemakings.

- Repeal of the formula would reward polluters who litigated instead of installing pollution controls and lost.

Several industry parties unsuccessfully petitioned the U.S. Court of Appeals for the Third Circuit to extend the compliance deadline for electroplating facilities. These parties now face a 1984 compliance deadline. Since they may not have begun to install the necessary pollution controls, they may now ask Congress to give them relief. Granting their request would reverse the well-established precedent that a polluter who

litigates under the Clean Water Act litigates "on his own time." It would make it more difficult for EPA to obtain voluntary compliance when future standards are set.

- The combined waste stream formula does not, as some have alleged, unfairly subject industry to a "moving target."

The formula assumes that technology can treat a toxic pollutant from several waste streams with the same efficiency unless one of the waste streams significantly dilutes the combined waste stream or contains other substances which impair treatment. Industries whose combined waste streams prove "incompatible" can: segregate the streams, raise any unforeseen problems in the rulemaking proceedings on future standards, (EPA must consider costs in setting each standard), or act prudently when selecting the technology they will install to meet the first standard. All Phase I standards have been issued in at least proposed form.* They do not get more stringent as a rulemaking proceeds, so an industry will not be surprised by more extensive control requirements if it plans ahead now.

---

* Phase II standards for the plastics molding and forming category have not been proposed yet. However, most of these processes are "dry"; those that are wet are generally dilute streams which are inappropriate for combination with more polluted waste streams.

In short, there is no need for a special amendment for integrated facilities. Substantial delay, disruption, and inequity would result if one were enacted. We therefore urge the Subcommittee to reject such proposals.

In closing, we would urge one amendment to the pretreatment-related provisions of the law: Congress should pressure EPA to issue regulations for the safe disposal of contaminated sludge.

EPA's Regulatory Impact Analysis of the pretreatment program concluded that "virtually all of the metal priority pollutants removed by the POTW collect in the resulting sludge stream." In fact, the high rate of dilution in POTW influent often masks potential sludge contamination problems. EPA's Regulatory Impact Analysis found:

> Several priority pollutants which were reported below their detection limits in most POTW influents regularly were quantified in sludge streams. Pollutants exhibiting this tendency include antimony, arsenic, silver, selonium, phenanthracene/anthracene and pyrene. For example, arsenic was measured above its detection limit in 15 percent of all influent samples, but in 94 percent of all sludge streams.

Section 405 of the Clean Water Act required EPA to develop comprehensive guidelines for sludge use and disposal by 1978, but EPA has yet to do so. We urge Congress to:

- set a new, realistic date for issuing the regulations,
- require EPA to identify and address all toxics in sludge, not just the most common heavy metals, and

- direct EPA to issue regulations which protect public health and the environment from any adverse effects from these pollutants.

The Senate Environment and Public Works Committee addressed the question of sludge disposal in its bill, giving EPA a new date for setting guidelines. We urge this Subcommittee to address the question as well.

TABLE I

SUMMARY OF ADVERSE EFFECTS OF SELECTED TOXIC POLLUTANTS IN POTW EFFLUENT

Chemical	Carcino-genicity	Muta-genicity	Terato-genicity	Other Reproductive Toxicity	Neuro-toxicity	Toxicity to Other Organ Systems
Arsenic	+	+	+	+	+	+ skin
Benzene	+	+	+	+	+	+ blood
DEHP		+	+	+		
Cadmium	+	+	+	+		+ lung, kidney, (liver)
Carbon Tetrachloride	+	+		+	+	+ liver, kidney, eye
Chloroform	+		+	+	+	+ liver, kidney, skin, heart, blood
2-Chloro-phenol	+					
Chromium	+	+	+			+ skin, kidney, liver, respir-atory tract
Dibutyl Phthalate			+	+		+ blood
2,4-Dichloro-phenol	+	+				+ liver
Lead	+	+	+	+	+	+ kidney, blood
Mercury	+	+	+	+	+	+ kidney
Methylene Chloride			+		+	+ liver, kidney cardiovascular system
Nickel	+	+		+		+ liver, skin
Phenol	+			+	+	+ liver, kidney
Tetra-chloroethylene	+	+	+	+	+	+ liver, kidney

20-955 O—84——139

Chemical	Carcino-genicity	Muta-genicity	Terato-genicity	Other Reproductive Toxicity	Neuro-toxicity	Toxicity to Other Organ Systems
1,1,1-Trichloro-ethane		+				+ liver, kidney, cardiovascular system
1,1,2-Trichloro-ethane	+				+	+ liver, kidney, lung
Trichloro-ethylene	+	+			+	+ liver, skin, kidney
2,4,6-Trichloro-phenol	+	+				
Vinyl Chloride	+	+	+		+	+ liver, kidney

Mr. ROE. Please proceed.

TESTIMONY OF JAMES TAYLOR BANKS, SENIOR ATTORNEY, AND FRANCES DUBROWSKI, SENIOR ATTORNEY, NATURAL RESOURCES DEFENSE COUNCIL

Mr. BANKS. Thank you, Mr. Chairman, good morning.

As always, it is a pleasure to join the committee to discuss the Clean Water Act.

As you may realize NRDC has been following every detail of this statute for some 10 years, and while we realize that 10 years pales in comparison to the experience we see across this table, it is a considerable background against which to assess the various amendments that are before the committee this morning.

From that perspective, it is our view that the committee has never been in a better position to take up these questions—principally because you have in H.R. 3282 possibly the best collection of initiatives for which one could ask. We support that bill as much for what is not in it as for what is in it. And two of the most important things that are not in it are the so-called opt out from the national pretreatment program and the BAT variance, which we think is a very bad idea, and about which I will have more to say in a moment.

H.R. 3282 can be improved, obviously, and two of the issues to which we hope you would pay the most attention are provisions to control nonpoint sources of pollution, along the lines of Mr. Oberstar's initiative, and a provision to prevent pollution backsliding from current permit levels to weaker standards that may be issued in the future.

In the brief time we have this morning, Mr. Chairman, I would like to concentrate on three issues. The first is construction grants funding. H.R. 3282 restores the authorization of funding to meaningful levels for fiscal year 1984 and beyond, and we support that wholeheartedly.

You may recall that in the 1981 hearings before this subcommittee, we testified that, in our view, cutting back the Federal support for this program and cutting the matching share for the Federal Government was a big mistake, and we still think it was a big mistake. According to the 1980 needs survey, the Federal share of the backlog secondary treatment and advanced secondary treatment needs in this country is something on the order of $24 billion. That is the nut. That is the amount that the Federal Government ought to be taking very seriously. At present funding levels, we have calculated that because of the effects of inflation, it will require approximately $53 billion and 22 years to eliminate that backlog, because if you spend a little bit along over the years, the remaining amount to be spent goes up and goes up, and it ultimately will take over 20 years to meet those needs. We think it makes no sense to take longer to do the job and virtually double the price tag. It makes no sense from the standpoint of water quality and no sense for the Federal budget.

We either have a real Federal commitment to cleaning up this backlog or we do not. We think that H.R. 3282 stands for the proposition that the Federal Government intends to be a genuine part-

ner in this program, and we urge you to support and adopt the restoration of that reauthorization level.

Second, there are a whole set of questions surrounding what is known as the BAT-toxic program. This is the centerpiece of the clean water strategy for dealing with toxic industrial discharges. One of those issues is a request we expect you will get from the administration for a new variance called the fundamentally different factors variance. I will not spend any time on it because Ms. Dubrowski is really the expert and will go into it fully, but I would like to deal with two other fairly related questions. The first is the need to extend deadlines for compliance with BAT, and the second is a water quality based variance being proposed by a variety of industrial interests.

Briefly, we think H.R. 3282 takes the right approach to the deadline extension question. There is no dispute that the current 1984 compliance deadline for BAT must be extended. It has to be extended because EPA has taken far longer than expected, and than required, to issue the EPA effluent standards with which industry must comply. In a few important cases, those guidelines will be issued after 1984, leaving absolutely no time for compliance. The questions are how best to extend the deadline and how far.

Our view is that there should not be a single deadline because EPA is issuing the relevant regulations over a span of 4 years. Some were out as early as 1981. Others will not be out until 1985. A single deadline gives some sources far longer to comply, and others far too little time to comply, or indeed both.

In our view, the compliance question ought to be governed by a rolling compliance period that is triggered by EPA's promulgation of the regulations. Each industry category ought to be given the same amount of time to comply, and that time should be triggered by issuance of the regulations. If a source can comply sooner, it should be required to do so, and the statute should state that very clearly.

Three years from promulgation of the regulation is the appropriate amount of time. The EPA Deputy Administrator testified on the Senate side that 3 years, or in many cases less, was the appropriate amount. Many witnesses have said before this committee that 3 years is probably enough time to issue the permits and allow sources to construct the facilities and achieve compliance. We have not been persuaded that there is a need for more than 3 years, and in this respect we disagree with Mr. Oberstar's initiative which would provide more than 3 years for some industries, notably the steel industry. If there is such a need, we think the witnesses should come before this committee and present it. And over the last 2 years, we have not seen it.

As to the variance from BAT, the principal proponents are members of the chemical industry. We think it is a very bad idea to provide a toxic variance in this statute. Congress considered that question in 1972, and said no. It was brought up in 1977, and Congress not only said it would not create new variances from toxic requirements, but it went back and made sure that existing variances from toxic requirements no longer were available. We think Congress should say no again—principally for three reasons.

First of all, we do not see where variances are needed. The best available technology regulations are flexible, and they are, by definition, economically achievable for the sources that must comply with them. Moreover, the regulations are carefully targeted by EPA. The agency does not regulate every source. It first looks to see if there are serious amounts of toxic pollutants being discharged by those sources, and whether regulations make sense, and they then drop a large number of sources because they are not of national priority. As a result, we have regulations that are targeted at the principal causes of pollution in the country. This is not overkill.

Second, a water quality based variance from BAT cannot be carried out at the present time. Mr. Ruckelshaus has said, in connection with the pretreatment program, that the tools, the scientific benchmarks and the analytical techniques are not available to make such a variance work. The same holds true for BAT. States, by and large, do not have toxics criteria in their State water quality standards, and those are the scientific benchmarks one would need in order to decide how much of a variance from BAT is appropriate. EPA has said that it may take 10 years or more to develop the kinds of scientific tools and benchmarks that would be needed to process these variance requests.

Third, a variance of any kind, but particularly one as complicated as this, would be a tremendous resource burden on EPA. The Agency has estimated that it would take about 600 people per year to process what it believes will be a substantial number of BAT variances, if there is to be such a provision.

Given the lack of need for such a variance, given the scientific difficulty of implementing it, and given the delays that go with addressing those tough scientific questions, we think 600 people a year is a terrible waste of EPA resources when they are spent to detract from the stringency of toxic controls.

Turning then to the third point—that is a series of issues related to water quality standards and post-BAT toxics permitting.

There is no secret that the Administrator of EPA has struck a bargain with the Senate Committee on the question of water quality standards. As you well know, EPA has issued new regulations on this subject. The Senate has indicated that it probably will withdraw the amendments that are now in the Senate Committee bill which would have forced that result, and the ball game is pretty much over on the Senate side.

That bargain, of course, does not apply on this side of the Capitol. We think you should stand back from that bargain and you should very carefully consider the need to go forward with the kinds of initiatives you find in H.R. 3282 on this subject.

First of all, as the events of October 1982 indicate, regulations can be changed. The past Administrator of EPA and her staff decided that longstanding policies under the statute ought to be drastically changed, and they issued a proposal that ultimately precipitated the events of last week. That can happen again as long as cean water policies are placed in regulations and not in the act itself.

Second, rules can be reinterpreted by the courts. It is much more difficult for a court to find hidden meaning in statutory language

where Congress has been clear in setting forth the policies it finds important in this statute.

Finally, the regulations that Mr. Ruckelshaus has submitted for your consideration, and in connection with the bargain on the Senate side, fall short of the protections provided by H.R. 3282.

First of all, while the pending amendment would require numerical criteria in State standards for toxic pollutants, the EPA regulations would permit States to either use numerical or narrative standards. A narrative standard is a statement in a regulation that says, for example, "these waters shall remain free of toxic pollutants." It is very difficult to enforce a narrative statement, and EPA's plan is to enforce it through fairly radical biomonitoring techniques. These techniques have real promise, and it is one area of research and development we are encouraging EPA to go forward with. But they are virtually untried. They have no provisions for protecting human health, and no one knows how long it will take to use them or how much it will cost. We think, for that reason, affording the States a choice is an unwise policy. Accordingly, we urge you to continue considering H.R. 3282 and its stress on numerical toxic standards.

Second, in two respects H.R. 3282 is much stronger than the EPA regulations in protecting the cleanest waters we have. There is in this statute a concept we tend to call antidegradation, and it says that for the cleanest waters, and particularly those that are considered outstanding national resources, there shall be no degradation except in very extreme circumstances. The EPA regulations are not as strong as the pending amendment. In particular, the bill would require that there be consideration of alternatives and of the water quality impacts any time a State proposes to allow degradation in the waters of a State park or a national park or other equally important ecological areas. The regulations would permit more degradation and not require States to justify degradation of those clean waters in the same fashion.

In sum, we think that H.R. 3282 ought to be, with respect to these subjects, the principal vehicle for this committee's consideration. We think Congress ought to speak on these national policy issues, rather than leave them to the whims of administrative negotiation and judicial interpretation. And we think these issues are important enough for you to assign them a very high priority in designing amendments in this committee.

Finally, as to the post-BAT toxics-control question, H.R. 3282 has what we think is a fine approach. The question is, Once BAT is in place, do we still have water quality problems out there? If we have them, what should we do about them, where are they, how bad are they? What H.R. 3282 says to Bill Ruckelshaus is: First, go find the worst locations, and find out what toxic pollution is still preventing people from using the water as we say they should be able to. It says, second: Figure out who is causing that problem, which pollutants are involved, how much of them are being discharged. And third, it says: Use your existing authority under this statute, in cooperation with the States, to figure out how much of a reduction in those remaining toxic discharges ought to take place so that the waters truly are safe for fishing and swimming.

H.R. 3282 leaves the Administrator and the States a great deal of flexibility as to the kinds of remedies they will require. What it does not leave them is the flexibility to decide either to do nothing about these remaining problems or to take another decade to figure out where they are. It requires Bill Ruckelshaus to stand up and give the public some confidence that, when we say a stream is safe for fishing and swimming, they can really count on that, and particularly in terms of toxic pollution.

That summarizes the high points of the written statement. I will be pleased to answer any questions at the appropriate time, but now I would like to yield to my colleague, Ms. Dubrowski.

Ms. DUBROWSKI. Thank you, Mr. Chairman, and members of the subcommittee. It is a pleasure to be back testifying.

As Mr. Banks said, my testimony will address the pretreatment program which is one of the Clean Water Act's——

Mr. ROE. Let me interrupt the witness. We have a vote on for the members. It is a quorum call followed by a 5 minute vote on the Harkin amendment. Rather than have you start and then break the continuity, suppose we go over and take care of this matter of state.

We will be back in 15 to 20 minutes.

[Short recess.]

Mr. ROE. The committee will reconvene.

We were just about to hear from Ms. Frances Dubrowski from the Natural Resources Defense Council.

Ms. DUBROWSKI. I was saying that the pretreatment program is, in our view, one of the Clean Water Act's most important programs for controlling toxic pollutants. It is now at a critical turning point. The national categorical standards are being issued; local POTWs are obtaining program approval from EPA; and the general regulations that establish the basic structure of the program were, as recently as this September, upheld by the U.S. Court of Appeals for the Third Circuit in all major respects but one. The one respect in which the regulations were not upheld had to do with the fundamentally different factors variance and I will talk about that in a minute.

In short, we are making progress under this program. It is important that Congress keep the pressure on for fuller pretreatment of toxics.

Our testimony today will address three proposals which either have been, or are likely to be, put before this committee. Each would seriously undercut the toxic pollution protection afforded by the program and should be rejected by the committee.

First, the fundamentally different factors variance. The Clean Water Act places a special emphasis on control of toxics. In 1977, Congress told EPA it could not grant variances from the toxic pollution protections of the statute. This provision makes sense. It places a premium on speed and uniformity. Speed, because the standards are set in one proceeding. Once they are in place, everyone can turn their attention to compliance, rather than dealing with attempts to relitigate the merits of the standards. Uniformity, because the standards are set by a single group of experts at EPA and reviewed by a single court of appeals.

This scheme offers industry certainty. Those who embark upon a pollution compliance program know their competitors will have similar guidelines and will not get different results by appealing to different decisionmakers. It still maintains flexibility. If new information comes to light, an industry could petition EPA or the courts for a change in the standards.

This was Congress' scheme. EPA invented one of its own, one which was, as I mentioned, recently held to be illegal by the Third Circuit Court of Appeals. Under EPA's scheme, if EPA failed to consider information in a rulemaking, or if the information was not presented to EPA, EPA could later consider that information as a reason for adjusting the pretreatment standards applicable to an industrial facility if the information was fundamentally different from that which was considered by the EPA. Because the third circuit held this was inconsistent with Congress' scheme for strict control of toxics, proposals may be made to you suggesting that the subcommittee add a variance provision to the law. We urge you to resist such proposals.

A variance would delay standard-setting for industrial facilities. It would take a year, under the best of circumstances, probably much more on the average, to go through the simple steps of processing a variance application as they have been laid out in EPA's regulations.

The processing of variances would consume considerable administrative resources because the task of analyzing the data base behind the standards would not only be done by EPA headquarters personnel, it would be duplicated by State, regional and local officials.

A variance would not simplify the task of setting standards for the bulk of sources. That is because individual plant differences will crop up. They do now and have been used to justify separate subcategories even where only one or two plants were involved.

A variance is not necessary. EPA's rules already contain contingency factors—extra time, margins of error—in case individual plants have process differences.

What a variance will do is create a loophole in the program, a way for EPA to postpone decisionmaking with respect to controversial sources, a way for industry to get a second bite at the apple in challenging its pollution control obligations.

One very telling example, General Motors recently filed 27 variance applications for electroplating facilities. Many seek extensions of the 3-year compliance deadline for controlling toxics. In some of those variance applications, dates for commencing engineering studies or preliminary design or dates for submitting appropriation requests for engineering studies begin 2½ years after the standards were promulgated.

We conclude from reading those various applications and from the litigation we have been involved in with GM and other parties, that GM waited until it had exhausted all litigation opportunities before it began its compliance program, and is now using the variance procedure to try to get EPA to ratify its decision to postpone compliance. If Congress puts a variance provision in the law, it will open the door to such challenges.

A second proposal, one we discussed in detail when we testified before you last year, was the notion of creating local program waivers. Some have suggested that qualifying POTW's be able to gain exceptions from the national program requirements. Then their industrial uses would only have to meet the local pretreatment numbers. This proposal was considered and rejected by the Senate Environment and Public Works Committee. They foresaw serious problems implementing a waiver.

It will raise difficult questions which will take years to resolve through the courts. It will consume substantial administrative resources. An EPA estimate suggests that as much as $13.5 million in a fiscal year will be necessary to process the local program waiver applications.

But, most important, it will not provide the same level of protection as the current program. That is because the benchmarks needed to judge the adequacy of local programs, the water quality standards, the sludge disposal guidelines, are simply not in place. Developing them will take sometime. We fear that what will happen in the interim with an attempt to process these waivers quickly so as to not disrupt the program is that the processing will degenerate into paper pushing and health and the environment will suffer in the process.

A third proposal which you may hear about is the proposal for special treatment for integrated facilities. Integrated facilities are those that combine waste from unregulated industrial categories with wastes from either another regulated industrial category or a process that is not regulated under the categorical standards at all. Since 1978 EPA has dealt with integrated facilities through a combined waste stream formula. The formula allows the discharge limit in a categorical standard to be adjusted, taking into account the other waste streams. This formula was recently exhaustively examined by the Third Circuit Court of Appeals which upheld the formula. The formula gives plants flexibility to keep different waste streams together, provided they are compatible for treatment purposes. It does not allow facilities to avoid pretreatment through dilution or through combining incompatible waste streams.

Some have proposed that there be a special provision in the Clean Water Act for integrated facilities, a provision which would allow these facilities some deadline extension—some would go so far as to say no deadline until all the pretreatment guidelines are in place.

We believe these proposals should be rejected. Repealing the formula would delay controls on toxics for facilities, such as electroplating facilities, that have had ample time to come into compliance. Repealing the formula would create economic disparity between plants located within the same industrial category simply on the basis of whether a facility chose to combine waste streams or not to combine waste streams. Repealing the formula might require EPA to go back and redo part of the rulemakings on the categorical standards which have taken a decade to put on the books. It would also reward those integrated facilities which have not come into compliance, which have instead tried to litigate, and which now, having exhausted their litigation opportunities, may be coming to the Congress asking for an extension of time. It would

reverse the long-standing principle in this statute that you litigate on your own time.

Finally, in closing, I would like to mention one change we would like to see to the pretreatment-related provisions of the statute. That is, the Clean Water Act in section 405 requires EPA to set sludge disposal guidelines by 1978. EPA has not done so. The Senate Environment and Public Works Committee considered this question and set a new deadline for EPA to propose those standards. We would urge this subcommittee to explore that question as well, to set a new and realistic date for the standards, and to require EPA's standards to protect health and the environment.

Thank you, and I will be happy to answer any questions you might have.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you.

Considering the issue of extending the BAT compliance deadlines, some have argued that focusing on the date the final regulations are promulgated for any given discharger is not the most appropriate point from which to measure the amount of time that will be necessary for a discharger to design and construct necessary treatment facilities. Instead, it is argued that the point of focus should be to the date on which the discharger's NPDES permit terms have been finalized.

What is your reaction to this latter proposal in terms of how much time the committee should consider would be necessary to negotiate the terms of compliance?

Mr. BANKS. We have given that a good deal of thought, and we hope you would oppose any notion that the compliance period should be triggered by issuance of the final permit. Here is why.

It takes a certain amount of time to issue these permits. EPA's estimate in the past was that it takes 6 to 9 months on the average where you have a regulation that furnishes most of the basis for the permit. But time is elastic, and what determines whether it is a short time or a long time, in most cases, is whether the industrial source applying for that permit wants the permit or does not want it. There are administrative hearings that could be conducted. There are appeals to U.S. courts of appeal which may take years to resolve. And if a source wants to stretch out the time to process a permit, it can do that. We think that the compliance period ought to start from issuance of the regulations, so that there will be a strong incentive on the part of those sources to get the permit expeditiously, rather than to exhaust all opportunities to extend the amount of time for processing the permit.

EPA has been asked this question in testimony before the Senate committee, and my recollection is that in their judgment, the period of 2 to 3 years from issuance of regulations is sufficient both for processing the permit and for constructing and installing the treatment facilities. I trust EPA would agree that this incentive to get permits issued expeditiously should be foremost in the Congress mind, and for that reason, that the compliance period should be triggered by the regulations, not by issuance of the permit.

Mr. PACKARD. Could that possibly lead to a delay then in issuing of the permits?

Mr. BANKS. Our view is that the permits will be issued more promptly if the sources want those permits to be issued.

Mr. PACKARD. By compliance——

Mr. BANKS. In other words, if I have 3 years to comply, I want to find out just as soon as I possibly can what my permit limits are. I do not want my construction period taken up in arguments with the State about what those final limits will be. I want them soon so I will have that 3 years to meet the requirements. I will be pushing strongly to get EPA or the State to give me that permit. On the other hand, if my construction and installation period begins when they finish writing the permit, then I will want to stretch that period out to delay those expenditures.

Mr. PACKARD. The testimony presented earlier made the point that implementing Federal categorical pretreatment standards in lieu of the city of Chicago's existing pretreatment program could result in a net reduction of control requirements for industrial facilities at a substantially greater program cost for operations.

If this situation is true with respect to Chicago and other publicly owned treatment works, would not the most environmentally responsible and fiscally sound public policy be to allow the stricter and more cost effective locally established programs to be implemented?

Ms. DUBROWSKI. I do not see how the premise can be true. Implementing Federal categorical standards is not going to reduce control requirements. The Clean Water Act already specifies that if there are more stringent State or local provisions out there, than those provisions would govern, so that the categorical standards will simply bring less stringent local numbers up to these uniform national numbers. It is not a good idea to depart from this scheme. Those Federal numbers make sense. They provide a level of uniformity to the program. Trying to depart from the Federal numbers and to substitute numbers will lead to all sorts of problems.

For example, in terms of how adequate those local programs are, if you go by something other than the numbers themselves, but look at water quality or sludge, the benchmarks to make those decisions are not in place.

Also, one other point to make is that you can look at different numbers and the two numbers themselves may not tell you all you need to know about what is or is not more stringent. You have to look beyond to the enforcement that goes with the numbers and whether there are adequate resources to carry out an enforcement program.

Mr. PACKARD. Do you feel there could be conflict between the Federal regulations and standards and those of local jurisdictions, like in the Illinois case?

Ms. DUBROWSKI. Local jurisdictions, many of them have their own numbers. Some appear on paper to be more stringent. Some appear to be less stringent. So when the Federal categorical standards are implemented, those that have more stringent numbers need not change them. Those that have less stringent numbers need to implement the Federal standards.

Mr. PACKARD. Thank you.

Mr. ROE. I want to thank you very much for your substantive testimony. You have been excellent witnesses and we appreciate what you are going to do.

The subcommittee is going to recess until 2 o'clock. The main reason we have to do that is many members have things to do on the floor. That is the best we can work out.

When we return, our first panel will be the Sierra Club, at 2 o'clock.

[Whereupon, at 12:35 p.m., the subcommittee recessed, to reconvene at 2 p.m., the same day.]

AFTERNOON SESSION

Mr. ROE. The subcommittee will resume. We will hear now from Mr. Michael Garabedian, Sierra Club Northeast Regional Office, and Mr. John Saxton, member, Interstate Conference on Water Problems.

The full text of your prepared statements will appear in the record at this point.

[Statements referred to follow:]

STATEMENT OF THE SIERRA CLUB BY MICHAEL GARABEDIAN

Chairman Roe and Water Resources Subcommittee members. My name is Michael Garabedian. I work in the Northeast Regional Office of the Sierra Club.

I will address three main topics using examples from the interconnected New Jersey, New York, Connecticut estuary: first, Section 404, second, ocean outfall discharge or 301(h) waivers, and, third, industrial pretreatment.

WESTWAY FREEWAY PROJECT/SECTION 404

Because Mr. Addabbo and Mr. Green began last week to seek Congressional authorization of a Section 404 loophole for the Westway freeway and real estate project on the lower westside of Manhattan, it is essential that I bring this issue to your attention, even though I had not planned to do so when requesting to testify.

The Addabbo-Green amendment (which amends, at this moment, the Second Supplemental Appropriations Bill) seeks in its language to do two things. First, it requires, as part of the project, that approximately 240 acres of new commercial fish habitat be created in place of the 200 acres that would be filled, along with a two year study to "enhance the likely effectiveness" of the mitigation. Second, it authorizes immediate engineering, planning, design, property acquisition, demolition and removal of man-made structures in the habitat area, tunnel protection construction, and a 39 acre "prototype" fill (17% of the total fill).

The language is precisely worded to revoke the rulings by the United States District Court Judge Greisa and the U.S. Court of Appeals that void the dredge and fill permit and require new environmental impact studies pursuant to the National Environmental Policy Act and the Clean Water Act. I do not wish to dwell on this issue here, since it should be the subject of its own hearing, but I will cover the main issues in a summary manner.

The amendment

The Westway amendment is the wrong way for Congress to intervene in the judicial process.

The Westway amendment is the wrong way for an appropriations committee to substitute a quick, short-cut procedure in place of authorizing committee deliberation.

The Westway amendment is the wrong way to undermine the National Environmental Policy Act, the Rivers and Harbors Act of 1899, and the Clean Water Act through the creation of loopholes in them.

The Westway amendment is the wrong way to administer Section 404, the Army Corps of Engineers, and the Federal Highway Administration. The Clean Water Act permits foiling a special acquatic habitat only where there are no practical alternatives, which is not the case here. Congress should formally receive information on

the alternatives before considering any amendments if it is going to act on this matter at all.

The Westway amendment is the wrong way to ask Congress for help with New York transportation and infrastructure problems.

The Westway amendment is the wrong way to prevent harm to the striped bass fishery. The Army Corps own expert panel and many others agree that a two season study of the area is necessary to determine how fish use the area and what the possibilities are for mitigation—if any. The Westway amendment is the wrong way to improve fish habitat, particularly that of striped bass up and down the Atlantic Coast that use the area in question.

The Westway amendment is the wrong way to force a vote on one of the most important New York Congressional environmental issues.

The Westway amendment is the wrong way for Congress to steamroll over community opposition and to not allow it to be heard.

The project

The $4 billion, 4.2 mile long Westway project is the wrong way to provide for surface transportation on the west side of Manhattan. A $100 million project could be developed on the existing on-land 260 foot right-of-way. Trucks would not be able to continue up the west side drive since commercial vehicles are prohibited. A grade-level alternative would only mean a longer trip of five to ten minutes.

Westway is the wrong way to revitalize the area or to encourage new development and for filling 90 new acres for parks and 100 new acres for development. The area is revitalizing itself, new development is taking place already that does not require a new fill and does not block access to the river, the state indicates that the park may not be built as planned, and there are existing areas, including fills, that could be developed into parkland.

Westway is the wrong way to improve the city's air pollution and truck traffic problems, which would both be worsened during the long construction period. Truck traffic on local streets would be minimally affected compared to a grade-level arterial. The most important way to reduce air pollution is to discourage automobile traffic and to encourage transit use.

Westway is the wrong way to, as the National Marine Fisheries Service says, "threaten the survival of the Hudson River population of Striped Bass." The region's Striped Bass fishery is valued at $100 million annually.

Westway is the wrong way to spend $4 billion. The project should be traded in to the tune of $1.5 billion for transit rehabilitation and bridge, road, and related infrastructure repairs. This would avoid up to $1 billion of borrowed capital and save 10 to 20 cents in terms of fare. New York is 49th in cars per capita—only Alaska is lower.

Westway is the wrong way to create jobs. Authorities agree that a trade in would create as many jobs as Westway, and a Sierra Club study shows that it would create more jobs than Westway.

Westway is the wrong project because Governor Cuomo's own Westway investigator concluded that Westway "has now become a luxury that the City and State probably cannot afford." (April 25, 1983 report by Thomas P. Puccio)

In anything, Congress should react to this issue by having joint Water Resources and Transportation Subcommittee hearings on the 404 issue that the transportation and trade-in issues. The National Environmental Policy Act implications should also be investigated. In this manner, Congress will have a chance to determine for itself whether we are correct in our belief that this is a project that can not survive informed public scrutiny.

OCEAN DISCHARGE/301(h) WAIVERS

I have always enjoyed opportunities to testify before this committee. This time I am glad to address you on the Clean Water Act because it gives us an opportunity to point out that though we disagree with the Building Trades on Westway, we join hands with them in support of the goal of secondary treatment and in opposition to liberal 301(h) waiver provisions.

When sewer service agencies on the Hudson-Raritan-Long Island Sound estuary began to apply for these waivers, the Sierra Club approached it with an open mind. We did this even though we felt that it was not the intent of Congress to allow secondary treatment waivers in estuaries such as New York's.

Now it is clear that waiver applications on these estuaries are not appropriate. Congress should act to prevent further delays and expenditures on 301(h) waivers in these and similar waters since this is an unjustified waste of local, state, and nation-

al taxpayers funds that can only lead to a retreat from the improvements in water quality that have been achieved.

The goal of reaching secondary treatment in these waters must be retained for the same reasons that the waivers must be eliminated here:

We should not take a step backward from the improvements in water quality that we already have achieved. There are signs that water quality in parts of the harbor complex is improving.

We should act only to decrease pollutant loads into these estuaries because they are too delicate and important to receive these kinds of discharges. The estuaries are a sink—they retain and react to toxics and other kinds of loads. The tri-state estuaries have a great number of water quality problems including raw and treated sewage plant effluent, combined sewer overflows (CSOs), urban non-point runoff, industrial point-sources, and so forth. All must be improved if we wish to meet the goals of the Clean Water Act.

If we find that some problems such as CSO's are in need of increased legislative attention and support, new and improved programs to regulate and fund them could be included in the law. New York City's proposal to sacrifice secondary treatment goals and plans with liberal waivers in an unpromising effort to make money available for other improvements such as CSO's may be well-intentioned, but is in error. HR 3282's excellent 301(h) provisions are necessary to protect our estuaries.

It should be noted that the Sierra Club does not support large-scale secondary treatment in the region as an end itself.

We support the use of alternative waste treatment technologies and waste water uses when it is appropriate. In the case of New York City we are not aware of any appropriate alternative technologies, however;

One of the biggest potential problems with the use of 301(h) waivers in estuaries that are stressed and that have a variety of dischargers is that of the "barn door." If EPA granted some, but not all of the 20 to 30 waiver applications in our area, the one denied would soon have their representatives sitting where I am now asking you why they did not get theirs instead of someone else. There are about 130 municipalities in the area who would be asking themselves the same question, as would the industries on individual permits. HR 3282 would prevent this situation.

The public cost of the waiver application process itself is excessive. Municipalities have to spend great amounts of money on these applications. It has been suggested that New York City spent $2 to $3 million on its 301(h) applications, and is spending more now. The city responds by saying it has not spent that much, will not say how much, and says that in any event the data being developed are used for other purposes besides the waivers. In addition to the application cost, state, regional, and federal agencies then have great review costs. This is money that would be better spent on the problems, not on avoiding taking action.

The Hudson-Raritan estuary is an example of escalating public costs resulting from applications and the ensuing battle of the experts. The Interstate Sanitation Commission (ISC) has developed a report that says there is not enough assimilative capacity in the New York Harbor complex for year-round reduced treatment. New York State has also used the same model with similar results. New York City's consultants have now published a report that disagrees with the ISC and the state.

Recently the National Wildlife Federation evaluated all three reports and found that "the City's analysis is not useful for predicting future dissolved oxygen conditions in the Harbor area."

It should be noted that, if anything, the ISC model itself is too liberal. For example, the water samples on which the studies are based are generally taken during daylight hours when the micro plants are producing oxygen. At night there is probably a dramatically increased oxygen demand. Fish, of course, need to survive in our waterways at night;

A major weakness in our area's 301(h) waivers is that the applicants are using a much too limited definition of "receiving waters" affected by their reduced treatment levels. For example, New York City's applications for Red Hook, Newtown Creek, Wards Island, Bowery Bay, and Hunts Point simply would fail to meet their objectives from the outset if they did not include adequate evaluation of the impact of reduced treatment on Long Island Sound since much of the surface flow of the waters into which they discharge enters the sound. All applications in the tri-state estuary are inadequate from the outset, since they do not consider the New York Bight Apex, the Hudson River plume, and the waters along the New Jersey coast as part of the receiving waters for which the impacts of reduced treatment is to be considered.

An historic trend worth noting is that some upper estuary improvements in water quality seem to have been made at the expense of or without helping to improve

lower parts of the estuary. Earliest reports referred to waste problems in the streets and then the canals into which wastes were channeled. At the turn of the century there were serious problems in the Hudson and the other waters around Manhattan. Now the Hudson has improved somewhat, but there are serious problems lower in the estuary. It appears that the historic process has been one of "pushing" pollution impacts further and further down stream from the sources. Given this trend, we need to sample, monitor, and model impacts 301(h) waivers will have as far downstream as the sound and its race area, the lower bays, the New York Bight Apex and the Bight itself including the Jersey shore.

A Well-documented problem with 301(h) waivers is that reduced secondary treatment will lead to increased toxic discharges. Secondary treatment removal of many kinds of toxics could be lost in the waiver process. This leads to my final topic, industrial pretreatment.

Before leaving the issue of estuaries, the Sierra Club would like to note that the ISC plays a key role in tri-state region water quality issues. Their involvement in past, present and future efforts to clean up the estuary is essential. For this reason, the ISC should be named and its role specified in any portions of the legislation that set up interstate estuarine management programs. When we have information that may help to clarify this issue, we will forward it to the committee.

INDUSTRIAL PRETREATMENT

The concept behind industrial pretreatment is sound: that by keeping toxics and other excessive loads out of the sewer system in the first place, we keep then out of the sewer plants, effluent and sewage sludge. Pretreatment is the current frontier of the Clean Water Act. Proposals such as local "opt-outs" would undermine the Act. Based on our evaluation of case studies, if any amendments are appropriate for pretreatment, it is only to strengthen the law.

In New York State there may be only a couple of relatively small municipalities, at most, that have the potential of developing acceptable programs independent of the national categorical standards. These communities have a potentially manageable problem and, unlike most, have the resources to do the scientific investigation, program, and enforceable limitations development that might justify an alternative.

However, it is not justified to have a national program based on this kind of minimal potential.

In most cases, the cost to the community, and the state and national agencies review would be excessive, and not justifiable. An even more critical problem would be the delay such applications would precipitate.

Research program development and denial could take 18 months to two years, and at the end of the period the process of developing a program pursuant to national standards would have to start all over again.

Most pernicious, though, would be the effect of enacting and opt-out program at this time. It could be seen as a boon to the communities that have not submitted programs, and would undercut program development already underway when they were postponed in order to develop and opt-out application.

The problem an opt-out system would have once established are vast to contemplate. The potential problem of forum-shopping alone should discourage lawmaking efforts of this kind.

The first pretreatment questions we should be addressing now are not opt-outs, but are what the status of the present program is and how it is working. The Sierra Club has undertaken a major participation in and study of New York City's proposed industrial pretreatment program as a case study of Clean Water Act implementation. We will be circulating a draft report for comment, and will send one to the committee when we do so.

We hope that the New York City study will serve as a framework for our members to evaluate other programs around the country. If New York is indicative, the EPA has a very large task ahead of itself in order to obtain compliance with the law and program that is only now being implemented not for the first time after years of debate.

Our study's expected findings are:

Great volumes of toxic heavy metals collect in New York City's sludge (3000 or more pounds per day) and pass through New York City's presently operating sewage treatment plants into receiving waters (5000 or more pounds per day—New York has two plants under construction which service areas now account for in the neighborhood of 350 million gallons per day of raw sewage discharge). Thus the city has both "interference" and "pass-through" problems.

The city is enbarking on a program of federally mandated categorical pretreatment regulations that cannot alone solve its sewer system toxic problems.

The city's pretreatment program, as planned, will not meet minimum federal requirements, including general prohibitions, procedural requirements, and legal authority requirements.

The city's program is inadequate and does not meet federal requirements for the following reasons:

1. The city has not adequately investigated potential industrial sources of toxicants, especially sources of mercury, zine, copper, nickel and lead.
2. The city has failed to establish or plan for a system of permits and records that would effectively monitor and control toxic discharges.
3. The city does not have a range of penalties that will effectively deter violations or punish violators.
4. The city's enforcement mechanisms may allow unnecessary delay.
5. The city has not established procedures for future public participation.

Up to this point we have made a number of recommendations to the city for its consideration in developing its pretreatment legislation/ordinance and regulations. While expressing an interest in our recommendations, the city adopted its legislation and program without committing itself to any of our suggestions. The following are examples of our recommendations:

1. Create a duty to continue to identify and regulate all important sources of toxic substances in New York City's wastewater and New York harbor, regardless of source or federal and state standards.
2. Require discharge permits for users (as opposed to "violative permits" which are issued only if a violation is discovered).
3. Increase civil and criminal penalties and the range of available penalties.
4. Create a right of legal action for any citizen wishing to enforce the provisions of this law.
5. Create a public participation program. The program would consist of access to permits and records, publication of significant violations and enforcement actions, and notice of, and opportunity to speak at, hearings regarding the contents or violation of the contents of any permit. This must include participation in the setting of permit limits, including compliance schedules. New York City should be required also to hold an adequate public comment period on their entire program before it is submitted to EPA.
6. Require effluent testing from more sewer users.
7. Expand plans to randomly sample and inspect all sewer users with greater frequency.
8. Eliminate enforcement delay with immediate cease and desist orders and quick notice to the Environmental Control Board of all violations not imminently dangerous and broaden the definition of "imminent danger" to include danger to the environment, receiving waters or animal or plant life.
9. Establish a toxicity surcharge. This could be implemented in a way similar to the present sewer surcharge. Discharges of toxic substances would be charged proportionately to the toxicity of their discharge. A higher schedule of rates could be imposed on dischargers whose toxic pollutants are removed in POTWs. Currently, New York City is paying for the disposal of privately generated toxic sewage. A toxicity surcharge would serve two important functions: it would encourage small industrial and commercial dischargers, untouched by categorical regulations, to change their practices to eliminate the use of toxic substances, and it would be a source of revenue for the pretreatment program. While we do not have full details necessary to justify such a program, it should be considered.

One of the weakest areas of the City's program has been its citizen involvement efforts. Citizens wanting to participate were not well enough informed to be able to participate in a meaningful manner. Reports released for comment were released in far too short a period of time to allow adequate review. We conclude that the City has not taken its charge to involve the public seriously. Whenever there has been a choice between increasing public involvement or expediting the program, public involvement has suffered. The state has not acted in a visible role indicating dissatisfaction with the City public involvement policies. However, we look forward to EPA fulfilling its responsibility in this area, and we have found some receptivity on the City Council to our presenting our position.

Our tentative recommendations to the EPA would be, if the agency certified the city program as it was submitted in May, that the City not be granted control authority status until the following tasks have been completed or included in the city's program:

1. A thorough investigation of sources of toxicants;

2. A plan to effectively control toxicants;
3. An expanded and organized system of permits and records;
4. A wider range of penalties for violators;
5. A plan for quick enforcement and coordination of government enforcement groups;
6. A plan for public participation in the permit process and public access to effluent data.

Judging from our involvement to date, strengthened and/or more finely tuned pretreatment provisions may turn out to be necessary to cure some of the problems. This depends in part on the EPA's commitment to establishing effective programs. We will report to the Committee about the progress of the report in the future.

In closing, Mr. Chairman, I would like to point out the great importance of the pretreatment program to this subcommittee and related areas of jurisdiction. The industrial pretreatment program has the potential of greatly helping to clean up:

The harbor water column for animals, plants, and human food and recreation;

Normal harbor sediments for marine life, shellfish, and human food;

Shipping channel sediments so that the options for dredge spoil disposal from new and maintained channels are increased and so that mud dump site degradation and off-site impact are reduced;

Sewage sludge so that options for its disposal are increased and the degredation of its dump and disposal sites is reduced;

Combined sewage overflows that will contain a much lower load of toxics when the storm surges wash out accumulated settled material;

Problems that result when sewage treatment plants break down or operate improperly;

Raw sewage outflows and inadequate levels of treatment that persist because of funding, scheduling, and other problems;

The New York Bight and its Apex, including the New Jersey coastal waters and the Hudson River and its plume front;

Long Island Sound.

Testimony of the Interstate Conference on Water Problems Concerning H.R. 3282, Amendments to the Clean Water Act

The Interstate Conference on Water Problems is the national association of State, interstate, and local water administrators who are responsible for the conservation, development, and management of water resources. we embrace State and Federal programs which will restore or maintain water quality in order to enhance indigenous aquatic life and water supply uses where such water quality is attainable. Water quality should also support such additional instream or withdrawal water uses as are adaptable to each body of water and consistent with State water use plans. The water quality objective should be to protect water resources and aid water use.

Consistent with this objective, ICWP believes that a balanced water quality and quantity management program will provide environmentally sound protection of the nation's water quality, but in doing so, will not restrict legitimate water use, discourage conservation and reuse of waters, conflict with State water use plans, or prevent authorized water use development.

Practically any water use can affect water quality. Examples range from the obvious discharge of municipal and industrial wastewater; through storm runoff from urban, agricultural, and stripmined lands; to maintenance dredging of waterways and the effects of commercial and recreational vessel traffic; and to the less obvious effects of diversion, impoundments, groundwater pumping, and groundwater recharge. These effects mean water quality planning cannot be done apart from water use planning. Each must support the other. Water quality standards should be formulated to recognize the quality changes inherent in water development and utilization.

Coordinated planning of water use and water quality is unavoidably difficult. There are complex relationships between quality and use that must be understood. There are trade-offs that must be identified and decisions that have to be made. The results will precisely define water uses that are necessary and achievable, along with water quality standards that will support those uses.

Most of this planning and standard setting remains to be accomplished; however, the legal framework is in place. The Clean Water Act stresses sound planning, sets national goals, and provides workable and enforceable tools to implement plans. That is as much as law can do. Federal statutory law should not dictate the outcome

of planning, set standards that must be achieved, designate uses which must be maintained, or prohibit certain uses unless such standards or uses are unquestionably applicable nationwide. These views are particularly pertinent to three sections in HR 3282:

Section 6 concerning water quality standards; section 10 concerning the 404 permit program; and section 11 concerning water quality effects of dams.

WATER QUALITY STANDARDS

A new subsection (B) is proposed to § 303(c)(2) that requires designated uses in effect on January 1, 1983 to be maintained unless a State demonstrates that three attainability requirements cannot be met. ICWP has serious problems with this proposal.

It should be recognized that uses and standards can, and should, change over time. We are a dynamic nation, and our water quality standards and planning program must be dynamic to meet changing needs. Freezing designated uses at any point in time would be a bad policy, and likely counter-productive.

Further, there is nothing sacred about the uses designated as of January 1, 1983. In some cases, the uses in place reflected a great deal of prior State consideration and planning. But in other States, water quality planning was not as far along, and the uses as of early 1983, were only preliminary and interim designations. In some cases, the designated uses may not exist, or have any potential to be achievable. Further planning in most States will confirm or revise these use designations to reflect real facts. Where States are undertaking this process, they should be allowed to proceed without interference. ICWP agrees that the three attainability criteria are valid, but economics alone is an insufficient test of attainability. This is not a complete list. Absent is any consideration of the physical nature of a water body and water quantities which can restrict or even preclude most water uses, regardless of water quality. This proposal will essentially prevent the type of planning and standards revision provided for in the Clean Water Act. The proposal should be dropped.

A new subsection (C) is proposed to maintain water quality in excess of that needed for designated uses. This is a nondegradation policy that again prevents standard setting through a sound planning process. But blanket adoption of nondegradation can have worse consequences than being purposeless. It can prevent designated uses from taking place because a simple water use, in itself, may be the direct cause of the change in water quality. Examples are a temperature change caused by a water supply reservoir, an increase in chlorides from the treated wastewater of a municipal system, and an increase in total dissolved solids resulting from conjunctive use of groundwater. None of these changes significantly affect designated uses if kept within the limits of properly formulated water quality standards. It can be seen that a non-degradation policy of this type is the antithesis of planning for water quality and water use. It overrides planning to dictate an outcome that prevents needed water use and may result in waste of scarce resources.

A new subsection (i) is proposed to § 303. It is a slightly different non-degradation policy than discussed above. It demands that existing uses be maintained no matter what happens. Why should existing uses always be preferred to planned future uses? As water administrators involved in the continuing process of allocating and re-allocating water use, we know that conditions affecting water use and needs change. water use can change dramatically, for example, when an agricultural region urbanizes or industrializes. Thus, ICWP must strongly oppose freezing water use to any particular pattern or point in time.

This same subsection proposes non-degradation of "waters of exceptional recreational or ecological significance". Such a statement is unnecessary. Exception waters will be recognized as such in most States' planning processes and the uses will be protected by appropriate standards. But those standards will recognize the need to protect recreational use, and also the impact of water quality on such recreation uses. Unfortunately, the proposal, again, tries to dictate a particular outcome, and would work contrary to public interest.

SECTION 404 PERMIT PROGRAM

A new subsection (B) is proposed to § 404(b). It specifies decision rules for the Secretary of the Army. He shall prohibit specification of a disposal site if there is an unacceptable adverse effect on the aquatic environment and/or a practical alternative to the proposed discharge. These rules are part of the current 404(b)(1) guidelines and are very difficult to apply.

The proposed legislation is worse still because it lifts decision rules out of the context of the body of the guidelines. The decision rules become totally unrelated to water quality, water quality standards, and designated water uses. Moreover, the "aquatic environment" and "unacceptable adverse effect" have no frame of reference. How can the rules be applied?

Every body of water contains a broad variety of aquatic environments. Some of these environments are very important to indigenous aquatic life, but others are not. Aquatic life, therefore, is a frame of reference. But this is not enough for a workable and understandable regulatory program. The aquatic life to be protected ought to be embodied in designated uses and supported by appropriate water quality standards. Then permit evaluation becomes a relatively simple and rapid process. This section should be dropped.

Six new subsections are proposed for § 404(q). These deal with time limits, interagency coordination, and internal relations of the Corps of Engineers and Department of the Army. ICWP recognizes there are problems with time limits and interagency cooordination. If the agencies are unable to work this out, Congress certainly should impose reasonable requirements.

While recognizing the authority of Congress to organize and oversee the Federal agencies, ICWP would offer some caution regarding the possible over-specification of internal delegation and reporting relationships. The Executive Branch should be left with sufficient flexibility to meet and address changing conditions and future needs, if the program is to prove efficient in the long run. In the processing of permits, ICWP supports increased flexibility for the District Engineer in negotiating with the individual States on matters such as time frames, processing schedules, joint application and notice, and cooperative field investigation and enforcement.

Congress should decide whether responsibilities under the Clean Water Act are delegable or not. If delegation is allowed, it should apply to all agencies. The public needs to know what delegations are made. This can be easily satisfied by agency rulemaking.

ICWP urges the Congress to review the provisions in the Act for State assumption of the § 404 program. We are pleased to work with the Committee in determining what must be done to encourage States to assume this program.

In 1979, ICWP, through the Water Resources Council, conducted an extensive survey of the capabilities of the States to conduct programs equivalent to those mandated by § 404. The States raised many questions regarding the scope of the regulations, the conflicts with existing State programs, the overall practicability of the regulations, and the efficiency of these regulations in effecting improvements in the quality of the waters they were designed to regulate. The issues raised in 1979 remain valid today.

Fully thirty-four of the fifty States indicated a preliminary interst in seeking delegation. This interest was tempered by several considerations:

The need for a temporary program of Federal grants to aid the development, start-up, and expansion of State permit programs for assumption;

That any legislation to permit delegation also provide the necessary flexibility to permit recognition of the unique physical and hydrological characteristics of the respective States;

That delegation to States be complete, providing for general oversight by the Federal agencies rather than an over-the-shoulder permit-by-permit review;

That where possible, existing State administrative and permitting procedures be honored, with Federal evaluation of these procedures being directed to the desired objective, not the precise process;

That any delegation be preceded by a written understanding for resolving intergovernmental disagreements prior to the public hearing process; and

That any delegation plan provide for a recognition of the variety of State programs which may be used to achieve the objectives of this area of water quality.

ICWP is pleased to submit for the record excerpts of significant findings of this report.

WATER QUALITY EFFECTS OF DAMS

The water quality effects of dams is an issue that was recently litigated in Federal courts. The legal issue was whether discharges from dams should be regulated by NPDES permits under § 402 of the Clean Water Act. This argument was rejected. Dams and reservoirs can cause a variety of water quality changes depending on the design and operation of discharge works, the likelihood of thermal stratification, and the quality of reservoir inflow. Design and operation techniques to avoid the rare problems are known and widely employed.

On July 28, 1982, ICWP was privileged to testify before this Subcommittee on this issue. At that time we presented the results of ICWP's survey of the States regarding existing State mechanisms for regulating and taking into account the water quality impact of dams. We are pleased to submit for the record a summary of the survey results.

The survey indicated that the water quality problems of dams can be and are addressed by programs operated under State law. For example, it is already a widespread practice among States to coordinate the review of permit applications or project proposals for dams or reservoirs with State water quality activities, State fish and game agencies, and the U.S. Fish and Wildlife Service. Also, many States reported that, should an existing dam or reservoir contribute to or cause pollution, it is subject to regulation and corrective action.

It is ICWP's view that dams are and should continue to be evaluated on a case-by-case or site-specific basis, and subjected to water quality management control when it is determined that water pollution results from a project. Under existing State law and mechanisms, water quality protection can be achieved where needed and feasible.

Should Congress choose to request a further study of this issue, it is urged to include in its request for a study the requirements that EPA, in cooperation with State water resource officials, report on the existing procedure (both formal and informal) within States to take account of the water quality impacts of dams, the interrelationship between achieving water quantity (resource) objectives at a dam and water quality objectives, and the potential impacts on the achievability of the primary purposes for which a dam or reservoir was constructed if water quality objectives are given priority.

In addition to the involvement of State water resources officials, ICWP recommends that important water quantity agencies such as the Corps of Engineers, the Bureau of Reclamation, and the Soil Conservation Service, be full and equal partners with EPA in the design and implementation of any such study.

The Committee on Public Works and Transportation is already familiar with the essential role of dams in the development and utilization of water resources. There are many regions of the nation where ample water supplies cannot be obtained by any other means. Thousands of miles of navigable waterways also depend on dams. The proposed study could improve an understanding of the relations between water use and water quality and the need for coordinated planning.

SUMMARY

Throughout this testimony we have shown that water use and water quality are not independent matters. Water uses have quality needs and water use itself can affect quality. Planning for both must be coordinated. This is a continuing process, because new water use needs will emerge and prior water uses must be changed.

ICWP supports the principle of non-degradation. However, we have shown the difficulty of drafting a workable non-degradation policy. Rather, the principle should be a primary objective of water quality planning.

The Clean Water Act provides the legal framework for this planning, but the work has only begun. Nevertheless, sound planning is the best assurance that the nation's water use needs will be met and that water quality will be restored and maintained to support water use. On the other hand, any action to freeze water quality standards or uses is the antithesis of planning to meet water use needs. What could be more intolerable than to waste water and financial resources and not meet water needs?

ICWP appreciates the opportunity to testify on this matter. We will continue to support and assist water quality programs in any way we can.

ICWP maintains an office at 21 DuPont Circle, N.W., Suite 600, Washington, D.C. 20036 headed by Joan M. Kovalic, Executive Director and General Counsel.

Mr. ROE. Please proceed.

TESTIMONY OF MICHAEL GARABEDIAN, NORTHEAST REGIONAL OFFICE, SIERRA CLUB; AND JOHN SAXTON, INTERSTATE CONFERENCE ON WATER PROBLEMS (ICWP)

Mr. GARABEDIAN. Thank you, Mr. Chairman. I work in the Northeast Regional Office of the Sierra Club.

Carolyn Carr came down with an illness on her way here from Alabama, and I understand she was able to make arrangements with you to testify tomorrow.

I will address three main topics, using examples from the interconnected New Jersey, New York, Connecticut estuary: first, on section 404; second, ocean outfall waivers; and, third, industrial pretreatment.

First, on section 404 and the Westway Freeway. Because Mr. Addabbo and Mr. Green began last week to seek congressional authorization of the section 404 loophole for the Westway Freeway and real estate project in the lower west side of Manhattan, it is important that I bring this issue to your attention, even though I had not planned to do so when requesting to testify.

The amendment is in H.R. 4293 at this moment, the Second Supplemental Appropriations Bill, and seeks in its language to do two things:

First, it would require, as part of the project, that approximately 240 acres of new commercial fish habitat be created in place of the 200 acres that would be filled; along with this, a 2-year study to "enhance the effectiveness" of the mitigation, as required.

Second, the amendment authorizes immediate engineering, planning, demolition of certain structures over and in the critical habitat area, and the 39-acre "prototype" fill.

The language is precisely worded to revoke the rulings by the U.S. District Court, Judge Greisa, and the U.S. Court of Appeals, that voided the dredge and fill permit and required new environmental impact studies pursuant to NEPA and the Clean Water Act.

I do not wish to dwell on this issue here, but I will go over the subject in a summary manner.

The amendment, itself, has several problems: The Sierra Club feels it is the wrong way for Congress to intervene in the judicial process.

We feel it is the wrong way for an appropriations committee to substitute a quick, short-cut procedure in place of authorizing committee deliberations.

The Westway amendment is also the wrong way to undermine the National Environmental Policy Act, the Rivers and Harbors Act of 1899, and the Clean Water Act through the creation of this loophole.

The amendment is the wrong way to administer section 404, the Army Corps of Engineers, and the Federal Highway Administration.

The Clean Water Act permits the destruction of special aquatic habitat only where there are no practical alternatives, which is not the case here.

The amendment is the wrong way to prevent harm to the striped bass fishery. The Army Corps expert panel and many others agree that a two-season study of the area is necessary to determine how fish use the area and what the possibilities are for mitigation, if any Striped bass from up and down the Atlantic coast use the area in question.

This is the wrong way to force a vote on one of the most important New York congressional environmental issues; and it is the

wrong way to not allow the substantial community opposition to be heard.

A couple of notes on the project, itself:

It is a $4 billion, 4.2-mile-long project that would be the wrong way to provide for surface transportation on the west side of Manhattan.

A $100 million project—essentially a street level arterial—could be developed on the existing on-land 260-foot right-of-way.

The original purpose of this project was partly to revitalize the area in question by providing 90 new acres for parks and 100 acres for development of the area. The area has since, in the last 10 years, begun to revitalize itself quite handily.

The project is also the wrong way to improve the city's air pollution and truck traffic problems. Truck traffic on local streets would be minimally affected compared to a grade-level arterial. And the most important way to reduce air pollution is to discourage automobile traffic and to encourage transit use.

Westway is the wrong way to, as the National Marine Fisheries Service says, "threaten the survival of the Hudson River population of striped bass." This has been a $100 million annual fishery.

The Environmental Protection Agency, the National Marine Fisheries Service, and another Federal agency, I believe the Fish and Wildlife Service told the corps, no, don't fill this wetland. The corps ignored this, and, in fact, withheld the information, as the judge found—and that's part of the reason he threw out the fill permit.

Of course, it's also the wrong way to spend this much money. The project should be traded in to the tune of over $1.5 billion for transit rehabilitation, and bridge, road, and related infrastructure repairs.

And it is also not the right way to create jobs, because the trade-in would create just as many jobs; the Sierra Club study shows, in fact, the trade-in would create more jobs.

Finally, it's the wrong project because Governor Cuomo's own Westway investigator concluded that Westway "has now become a luxury that the city and State probably cannot afford."—which is the April 1983 report.

If anything, Congress should react to this issue by having joint Water Resources and Transportation Subcommittee hearings on the 404 issue and the transportation and trade-in issues, and the NEPA impacts.

In this manner, Congress will have a choice to determine for itself whether we are correct in our belief that this is a project that cannot survive informed public scrutiny.

But, by far the best congressional action would be to let the lawsuit play out its course; that is, to let the laws remain intact.

My second subject is on the 301(h) pollution discharge waivers:

I have always enjoyed opportunities to testify before this committee. This time I am glad to address you on the Clean Water Act because it gives us an opportunity to point out that though we disagree with our building-trades friends on Westway, we join hands with them in support of the goal of secondary treatment and in opposition to liberal 301(h) waiver provisions.

When sewer service agencies on the Hudson-Raritan-Long Island Sound estuary began to apply for these waivers, the Sierra Club approached it with an open mind.

Now, however, it is clear that waiver applications on these estuaries are not appropriate.

Congress should act to prevent further delays and expenditures on 301(h) waivers in these and similar waters since this is an unjustified waste of local, State and national taxpayer funds that can only lead to a retreat from the improvements in water quality that have been achieved.

The goal of achieving secondary treatment in these waters must be retained for the same reasons that the waivers must be eliminated:

First, we should not take a step backward from the improvements in water quality that have been achieved.

And we should act only to decrease pollutant loads into these estuaries because they are too delicate and too important environmentally and economically to receive these kinds of discharges.

The estuaries are a "sink"—they retain and react to toxics and other kinds of materials that enter them. The tri-State estuaries have a great number of water quality problems, including raw and treated sewage plant effluent, combined sewer overflows (COS's) urban nonpoint runoff, industrial point-sources, and so forth. All must be improved if we wish to meet the goals of the Clean Water Act.

If we find that some problems such as CSO's are in need of increased legislative attention and support, then new and improved programs to regulate and fund them could be included in the Act.

New York City's proposals to sacrifice secondary treatment goals and plans with liberal waivers in an unpromising effort to make more money available for other improvements, such as CSO's, may be well-intentioned, but are in error.

H.R. 3282's excellent 301(h) provisions are necessary to protect our estuaries.

It should be noted that the Sierra Club does not support large-scale secondary treatment in the region as an end in itself.

We support the use of alternative waste treatment technologies and waste water uses when it is appropriate. In the case of New York City we are not aware of any appropriate alternative technologies, however.

One of the biggest potential problems with the use of the 301(h) waiver is in estuaries that are stressed and that have a variety of dischargers, is that of "opening the barn door".

If EPA granted some, but not all, of the 20 to 30 applications in our area, the ones who were denied would soon be sitting before you, as would the 130 other municipalities and the industries on individual permits. H.R. 3282 would prevent this situation in that area.

The public cost of waiver applications, the process, itself, is excessive.

Municipalities have to spend great amounts of money on these applications. It has been suggested that New York City spent $2 million to $3 million on its 301(h) applications, and it is spending more now.

The city responds by saying it has not spent that much, but has not volunteered how much it has spent, and says that in any event the data being developed are used for other purposes besides the waivers.

In addition, of course, the application costs the State, regional and Federal agencies who have to review the application.

The Hudson-Raritan estuary is an example of escalating public costs resulting from applications and tbe ensuing battle of experts.

The Interstate Sanitation Commission (ISC) report, finds there is not enough assimilative capacity in the New York Harbor complex for year-round reduced treatment, as has been applied for in the 301(h) waivers. New York State has run the same model and found the same results.

The City's consultants, however, have now published a report that disagrees with the ISC and the State.

Recently experts with the National Wildlife Federation evaluated all three reports and found that the city's analysis, "is not useful for predicting future dissolved oxygen condition in the harbor area."

It should be noted that, if anything, the ISC model—the model that has been used by the different organizations to determine the oxygen content—is too liberal.

For example, the water samples on which the studies are based are generally taken during the daylight hours when the microplants are producing oxygen under the sunlight. At night there is probably a dramatically-increased oxygen demand. Fish, of course, don't go to sleep.

A major weakness of our area's 301(h) waivers is that the applicants are using a much too-limited definition of "receiving waters" affected by the reduced treatment levels.

For example, all applications in the tri-State estuary are inadequate from the outset since they do not consider the New York Bight Apex, the Hudson River plume, and the waters along the New Jersey coast as part of the receiving waters for which the impacts of reduced treatment should be considered. They simply do not adequately consider Long Island Sound, either.

An historic trend worth noting is that some upper estuary improvements in water quality seem to have been made at the expense of or at least without helping to improve lower parts of the estuary.

Earliest reports referred to—these are from back in the 1,600s and so forth—refer to waste problems in the streets and in the canals into which the wastes were channeled; then at the turn of the century there were serious problems in the Hudson River and other waters immediately around Manhattan.

Now the Hudson has improved somewhat, but there are serious problems lower in the estuary.

It appears that the historic process has been one in effect of pushing, or at least of the problem moving further and further downstream from the sources.

Given this trend, we need to sample, monitor and model the impacts of 301(h) waivers as far downstream as the Sound—Long Island Sound—its race area, the lower bays, the apex and the Jersey shore.

A well-documented problem with 301(h) waivers is that reduced secondary treatment will lead to an increase in the toxics leaving the sewage plants.

This leads to my final topic, industrial pretreatment. But a final note on the issue of estuaries, is that we would like to note that the Interstate Sanitation Commission plays a key role in the tristate region on water quality issues.

They are involved in past, present and future efforts to clean up the estuaries as essential. For this reason, the ISC should be named and its role specified in any portions of legislation that set up interstate estuarine management programs.

And we are looking at this same issue in relation to other similar sorts of bodies; and we will provide the committee with information on that.

Regarding industrial pretreatment—the concept behind it is sound; that by keeping toxics and other excessive loads out of the sewer system in the first place, we keep them out of the sewer plants, the effluent and the sewage sludge.

Pretreatment is the current frontier of the Clean Water Act. And it is no more true anywhere else in the country than in the Northeast. Proposals such as local waivers or opt-outs would undermine the act.

Based on our evaluation of the case studies in the Northeast region, if any amendments are appropriate for pretreatment, it is only to strengthen the law.

In New York State there may be only a couple of relatively small municipalities, at most, that have the potential of developing acceptable programs independent of the national categorical standards.

These communities have a potentially manageable problem and, unlike most, have the resources to do the scientific investigation, program, and enforceable limitations development that might justify an alternative.

However, this is not a justification to have a national program that has opt-outs based on this minimal potential.

In most cases the cost to the community, and the State and national agency review and preparation would be excessive; and an even more critical problem would be the delay such applications would precipitate.

Research program development and denial could take 18 months to 2 years, and at the end of the period the process of developing a program pursuant to national standards would have to start all over again.

Most pernicious, though, would be the effect of enacting an opt-out program at this time. This could be seen as a boon to the communities that have not submitted programs yet, and would undercut program development already underway that would be postponed in order to develop new opt-out applications.

The problems an opt-out system would have once established are vast to contemplate. I will only mention the potential problem of "forum-shopping" as one that should discourage lawmaking efforts of this kind.

The first pretreatment questions we should be addressing now are not opt-outs, but are what the status of the present program is

and how it is working. Then we can address the need for FWPCA amendments.

The Sierra Club has undertaken a major participation in a study of New York City's proposed industrial pretreatment program as a case study of the Clean Water Act implementation. We will be circulating a draft report for comment soon, and will send one to the committee when we do so.

We hope that the New York City study will serve as a framework for our members to evaluate other programs around the country. If New York is indicative, the EPA has an incredibly large task ahead of itself in order to obtain compliance with the law and program that is only now being implemented for the first time after all these years of debate.

Our study's expected findings are: 3,000 pounds per day of toxic heavy metals collect in New York City's sewage sludge, and 5,000 pounds of heavy metals per day pass through the New York City presently operating sewage treatment plants into receiving waters.

New York has two plants under construction, which service areas now account for in the neighborhood of 350 million gallons per day of raw sewage--that certainly add to the problems of heavy metals.

One finding is that the city is embarking on a program of Federally mandated categorical pretreatment regulations that cannot by itself, solve the sewer system toxic problems. But reductions in industrial wastes are a key part of the solution.

However, the city's pretreatment program, as planned, will not meet minimum Federal requirements, including general prohibitions, procedural requirements, and legal authority requirements for the following reasons:

First, the city has not adequately investigated the potential industrial sources of toxicants, especially in cases of mercury, zinc, copper, nickel, and lead;

The city has failed to establish a plan for a system of permits and records that would effectively monitor and control toxic discharges;

Third, the city does not have a range of penalties that will effectively deter violations or punish violators;

Fourth, the city's enforcement mechanisms may allow unnecessary delay;

And, fifth, the city has not established procedures for future public participation.

Up to this point in the process, we have made a number of recommendations to the city for its consideration in developing its pretreatment legislation, ordinance and regulations.

While expressing an interest in our recommendations, the city has adopted its legislation and programs without committing itself to any of our suggestions.

The following are examples of our recommendations:

Require discharge permits for users of the sewer system, as opposed to a violative permit situation, which are issued only if a violation is found;

Increase civil and criminal penalties and the range of available penalties;

Create a right of legal action for any citizen wishing to enforce the provisions of the law;

The public participation program should consist of access to permits and records, publications of significant violations and enforcement actions; and notice of and opportunity to speak at hearings regarding the contents or violations of the contents of any permit.

We have recommended they expand plans to randomly sample and inspect all sewer users with greater frequency.

And we recommended they eliminate enforcement delay with immediate cease-and-desist orders and broaden the definition of problems subject to stringent enforcement actions.

We have also recommended they establish a toxicity surcharge, so that discharges of toxic substances would be charged proportionately to the toxicity of their discharge. A higher schedule of rates could be imposed on dischargers whose toxic pollutants are removed with the POTW's. One of the weakest areas of the city's program has been in citizen involvement efforts. Citizens wanting to participate were not well enough informed by the city to be able to participate in a meaningful manner. Reports released for comment were released in far too short a period of time to allow adequate review. We conclude that the city has not taken its charge to involve the public seriously. The State of New York has not acted in a visible manner, indicating dissatisfaction with the city's public involvement policies. However, we do look forward to EPA fulfilling its responsibility for public involvement, and we have found some receptivity on the city council—of the city—for our presenting our position to them.

Our tentative recommendations to the EPA would be based on the program the city submitted to the agency in May, and we would recommend that the city not be granted control authority status until the tasks mentioned above have been completed or included.

Judging from our involvement to date, strengthened and/or more fine tuned Clean Water Act pretreatment provisions may turn out to be necessary to cure some of these problems. This depends, in part, on the EPA's commitment to establishing effective programs. We will report to the committee the progress of our work in this area.

In closing, Mr. Chairman, I would like to point out the great importance of the pretreatment program to this subcommittee and related areas of jurisdiction and interest. The industrial pretreatment program has the potential of greatly helping to clean up—the harbor water column for animals, plants, and human food and recreation;

Normal harbor sediments for marine life and human food;

Shipping channel sediments so that the options for dredge spoil disposal from new and maintained channels are increased; and so that mud dump degradation and offsite impact are reduced;

Sewage sludge so that options for its disposal are increased and degradation of its dump and disposal site is reduced;

Combined sewage overflows that will contain a much lower load of toxics when storm surges wash out accumulated settled material;

Problems that result when sewage treatment plants break down or operate improperly;

Raw sewage outflows and inadequate levels of treatment that persist because of funding, scheduling, or other problems.

In other words, pretreatment will help to clean up the New York Bight and its Apex, including the New Jersey coastal waters and the Hudson River and its plume front and the Long Island Sound.

We urge the committee to act aggressively to maintain and strengthen the Clean Water Act.

Thank you.

Mr. ROE. Mr. Saxton?

Mr. SAXTON. Thank you, Mr. Chairman.

I certainly appreciate the opportunity to come and talk to you today.

Today I will be representing the Interstate Conference on Water Problems, in giving their—a summary of their—statement.

Mr. ROE. Excuse me, Mr. Saxton.

Both statements will appear in the record in full.

Mr. SAXTON. Yes, sir, thank you.

In order to give you some background, in addition to being on the board of directors of the Interstate Conference on Water Problems, in my home State, I am the director of the soil and water conservation commission, and chairman of our State water quality board; the chairman of our interagency coordinating committee on natural resources; the chairman of our water well licensing committee; and so I do have some familiarity with these various activities that we are talking about today.

The Interstate Conference on Water Problems is an organization of State, interstate agency officials in the 50 States, in which we attempt to take positions on for the betterment of all the States concerned.

We have three sections that we would like to make comment on today, sections 6, 10 and 11; section 10 being the water quality standards.

We feel like that the section as is now proposed will completely obliterate the State planning process on water quality.

If you designate a time frame or a place in time and maintain a particular standard for that stream or that water body, forever and now on, you do not allow any future expansion in the State, you do not allow for any change in conditions that certainly occurs.

So we feel as though that this has to be flexible and dependent upon water use.

Water quality and water use and water quantity have to be interrelated and each dependent upon the other.

And if you make one of them static, you are destroying the ability to not only manage that one, but also the other related items.

Under section 205(j) our State planning process would be completely stopped.

So you have to leave this dynamic changeable situation there where we can reclassify as local conditions require.

Under section 404, under the 404 permit program, we have—we feel like there that some of the things in this proposed legislation are not really tied to any specific items.

For example, the terms "acquatic environment," and "unacceptable adverse effect," have no relation, really, to anything except to the person that wrote the language; because you certainly could not make a decision based on those two terms. Now, you have got to have some kind of reference on what is the situation as it is right now, and what do you want to maintain in that in terms of: What are the impacts of the permit? How does it impact upon current use and the intended use of your wetlands?

We certainly want to support the saving of wetlands, and the discontinuation of this destruction; but we think it has to be done in a manner which is practical, which is quick, which can be processed through various agencies in a reasonable time.

In my own State we have had section 404 permits that were requested by agricultural users and they had already lost two crops before they got a permit. And you can't—you've got to have something that moves faster than this.

But at the same time, we certainly have got to have time to weigh all the various factors involved.

On your water quality effects on dams, the ICWP position on this is that we feel as though this is a program that can be operated by the States.

It does not have to be regulated in a real definitive fashion by national legislation.

Most of the States under your dam safety program and also under State programs of a similar nature have this problem under control.

Now, certainly, when you construct a dam, there certainly is going to be changes in ecological systems that are present before the dam. And you are certainly going to have different qualities of water.

But, here again, you have to relate this to the intended water use and what qualities do you want to maintain in order to provide water that's acceptable for that use.

I think throughout our testimony here we want to emphasize the fact that you must consider water use and water quality as interdependent and any legislation that is developed must take this into account.

Mr. Chairman, as a sidelight here, I'd like to tell you that we appreciate your taking our recommendations on your water resource bill, from ICWP, and we certainly want to assure you we will work with you in the future.

Thank you.

Mr. ROE. Thank so much for your splendid testimony. We appreciate it and particularly the depth you've gone into in the areas of your interest and concern. We'll look into that in New York.

Mr. GARABEDIAN. Thank you, Mr. Roe. I appreciate your helping to accommodate our airline schedules.

Mr. ROE. Thank you very much.

Mr. SAXTON. Thank you, sir.

[Subsequent to the hearing, the following were received from the Interstate Conference on Water Problems:]

INTERSTATE CONFERENCE ON WATER PROBLEMS,
March 8, 1983.

Hon. ROBERT A. ROE,
Committee on Public Works and Transportation, Subcommittee on Water Resources, House of Representatives, Washington, D.C.
Attention: Charlotte Miles.

DEAR CONGRESSMAN ROE: I am writing on behalf of the Interstate Conference on Water Problems. We understand that the Subcommittee on Water Resources held a hearing on February 23 in regard to the Environmental Protection Agency's proposed water quality standards regulations. Enclosed please find ICWP's comments to EPA on these regulations.

ICWP is an independent national association of state, intrastate, and interstate water officials concerned with the full range of water issues—both quality and quantity related. ICWP was established in 1959. Its purpose is to facilitate cooperation within the water community as to water issues, legislation, and Federal-state relationships. ICWP also serves as the policy advisory group on water issues to the National Governors' Association.

On behalf of ICWP, I respectfully request that the enclosed comments be submitted for the record.

Sincerely,

JOAN M. KOVALIC,
Executive Director and General Counsel.

INTERSTATE CONFERENCE
ICWP
ON WATER PROBLEMS

COMMENTS ON EPA'S PROPOSED
WATER QUALITY STANDARDS REGULATIONS

The Interstate Conference on Water Problems (ICWP) is a national association of State, intrastate, and interstate officials concerned with the broad range of water management and related matters. The purpose of ICWP is to facilitate cooperation, consultation, and exchange of information among water resources administrators and governmental officials as to the conservation, use, development, and administration of water and related land resources, the law governing these matters, and Federal-State relationships in the field of water and related resources.

ICWP commends the EPA for its efforts in clarifying and simplifying the Federal water quality standards setting process (regulation 40 CFR 131) as found in the October 29, 1982, Federal Register. Attainment of a greater degree of "reasonableness" and "flexibility" on the part of EPA in the administration of this important provision of the Clean Water Act is welcomed by the States. Pursuit of a workable "partnership" in the program, as envisioned in the Clean Water Act, is also encouraged by ICWP; and is in recognition of the primary responsibility held by the States to develop, administer, and enforce water quality standards in their respective States, in keeping with the goals of the Clean Water Act. The October, 1982, draft "Water Quality Standards Handbook" by EPA can be of much assistance to the States in fulfilling this responsibility and in providing for a consistent approach to developing standards. With this Handbook, the States would follow the steps identified to document decisions on present and future uses, including only the steps necessary to fully justify the decision.

As a final general comment, the Handbook may more properly contain the "optional" processes identified in the proposed regulations. Such optional processes go beyond the mandatory minimum requirements and are intended to provide guidance to the States in the standards setting process. If the goal of EPA is to set forth a clear and straightforward set of minimum requirements, optional and guidance information should be included in the regulatory guidance information.

Comments by ICWP on each provision of the proposed regulations are as follows:

1. Focusing on Priority Water Bodies

Current regulations require States to review on a statewide basis all standards at least once every three years. The EPA proposed regulations would allow States to focus their standards review on priority water bodies rather than conduct a statewide review. Public review and hearings will be required for any proposed changes by the State.

ICWP supports the proposal of focusing on priority water bodies rather than pursuing a statewide review every three years. This change would allow a more in-depth review of the standards for priority concerns and would allow the States to focus their efforts on site-specific water quality standards. The complexity and cost of the technical analysis intended to support any changes could preclude a statewide effort due to limited State program resources.

In the determining of priority water bodies by the States, ICWP believes that EPA lacks the authority to disapprove the States' selections. States should have the prerogative of targeting priority pollutants in these decisions.

2. Determining the Attainability of Uses

Past EPA policy, as outlined in the Red Book, was based upon a presumed applicability (now rescinded) and attainment of the goals for the uses of water as set forth in the Clean Water Act. Attainment of "fishable and swimmable" uses as a national goal has been inflexible and has failed to recognize natural, physical, chemical, and biological differences in water bodies.

The EPA proposed change would recognize natural and regional conditions and would allow States to designate standards of use which can be reasonably obtained. States would follow a "scientific approach" in justifying standards which are attainable and which "weigh environmental and physical factors impairing the attainment of such uses."

The issue of use attainability has been the subject of much controversy among those with interests in water resources management. Many have questioned the commitment by EPA to the goals of the Clean Water Act and the intent of the Congress, which some assert cannot be changed by promulgation of regulations alone. Others, many of whom have first-hand experience in administration of State water quality programs, support the proposed changes as an alternative.

At the heart of these variant opinions, in many instances, are the individual perceptions of what is intended by EPA in the proposed changes. EPA must provide further clarification to assure that its position is not misinterpreted, through a reaffirming of its commitment

to the goals of the Clean Water Act. EPA should assist the States in maintaining strong water quality programs, consistent with the Clean Water Act, where pressure to "backslide" by economic or other interests may be present.

In reviewing the procedures outlined in the proposed regulations for determining appropriate uses for water bodies, ICWP supports, with some reservations, the concepts for selecting attainable uses. Survey of water bodies to determine natural and other conditions and consideration of reasonable costs are both favored as workable concepts. Striving toward uses that can be actually and reasonably achieved has merit when contrasted with the sometimes unsubstantiated use criteria that are presently required. This approach would enhance the water quality/water quantity interface through the setting of goals for uses which are currently being attained or are anticipated to be attained. This would benefit the States actively pursuing State water plans, which are primarily use oriented. ICWP wishes to be assured, however, that where States select to implement more stringent water quality standards than required under the minimum criteria EPA must support these standards.

The commitment to more realistic goals will also serve to ease the frictions which have been unnecessarily created between the States and EPA over the issue. A closer relationship should result, particularly at the regional level. Standards can be used as a much more effective water quality management tool, with State program resources being committed to more effective ends.

However, ICWP urges restraint and thoughtful consideration in implementing such a change. A program developed upon water quality based standards would place a burden upon many States that are not technically or financially able to accurately differentiate between background conditions and resulting impacts from discharges. The analysis, site-specific criteria development, and use-attainability analysis could strain limited state budgets in providing for a water quality management program, particularly in light of reductions in Federal support funding. EPA is urged to prioritize its considerable resources and expertise to assist States in those analyses where States are limited.

ICWP believes that benefit-cost assessments do have a legitimate function in the standards-setting process provided that any changes made by the States in setting standards be consistent with the national interim goals of the Clean Water Act. No uniform consensus exists among the ICWP membership as to the merits of this proposal, and strong opinions have been voiced both pro and con. However, it is recognized that changes in water quality standards must not be solely based on economic criteria.

3. Changing Designated Uses

Existing guidelines refer to the types of changes which can be made relative to designated standards, such as "downgrading" and "upgrading," and provide for standards removal; however, the existing regulations do not specifically provide for these definitions nor do they provide for a

clearly enunciated hierarchy of uses, as is implied. The proposed changes establish a new terminology to describe changes in uses, i.e., "adding," removing," and "modifying" designated uses. The regulations also allow States to consider steps where standards may be partially met due to situations such as intermittent streams or wetlands, or due to seasonal variations, without abandoning the standard altogether. Permanent physical changes, such as dams or diversions which interfere with attainment of certain uses, are also provided for. ICWP supports the proposed terminology for identifying changes in use designations by the States.

States should initiate changes in water quality standards when water quality goals are threatened or additional substances require standards. In making modifications, attained uses must be protected. The fundamental objective of the Clean Water Act to restore and enhance water quality through a continual striving for higher standards wherever possible should be adhered to by EPA and the States.

ICWP is in agreement with the conditions identified in the proposed regulations under which States can modify or reclassify a use, where the existing use cannot feasibly be attained, in keeping with the aforementioned statements.

ICWP supports the concept of seasonal use criteria which do not allow an unreasonable decrease in water quality, which would protect the most sensitive use. This concept is consistent with the mandate of the Clean Water Act for the protection of maintenance and propogation of the full life cycle of aquatic life. Seasonal and regional variations can be appropriate, provided water quality is not degraded as mandated in the Clean Water Act.

4. Levels of Aquatic Protection

Existing regulations do not define levels of protection within the aquatic protection use category, although subcategories have evolved in recognition of the variability of fisheries needs, etc. The proposed change would by regulation provide the states with an opportunity to define subcategories of aquatic protection uses which reflect different levels of protection.

ICWP recognizes that many States have taken such steps in promulgating State water quality standards, and other States will no doubt follow suit. Protection of waters of varying quality is an important concept not only to water quality management, but to fisheries management. EPA regulations should encourage States to protect all waters of the State. States that desire to do so can choose to go beyond technology-based controls where necessary to achieve desired water uses and to protect aquatic life and health.

ICWP supports the concept of allowing States to establish varying levels of criteria to protect desired aquatic life communities except where a given level of control may be insufficient to protect the full life cycle of aquatic life in a balanced and viable aquatic community.

5. Developing Segment-Specific Criteria

ICWP supports the proposal for allowing States to develop segment-specific criteria. Existing regulations do not identify acceptable methods by which States can develop segment-specific criteria, although States are required to develop defensible criteria for designated water uses. The policy of presumptive applicability (rescinded, November, 1980) in setting criteria failed to recognize segment-specific situations of which the States have first-hand knowledge. The proposed changes in the regulations provide flexibility to the States in setting and revising criteria applicable to specific situations and local conditions. States may by regulation tailor water quality criteria to specific water bodies or local aquatic communities rather than using national, laboratory derived criteria from EPA.

6. Antidegradation and Maintenance of Existing Uses

The existing policy on antidegradation requires that all States develop, adopt, and implement a policy to maintain and protect existing instream water uses and, where a State feels it is appropriate, future uses. Existing high quality waters may be subject to higher levels of pollutants if a State chooses, provided that the degradation of water quality not interfere with or be injurious to existing instream uses. Further, States shall attain the highest regulatory requirements for all new point sources and continue an effective management program for nonpoint sources. EPA places a very high priority on an alternative policy which would emphasize protection and maintenance of existing uses, thus limiting the existing mandatory antidegradation policy. Three options are presented for which comments are requested.

ICWP prefers option 2 because it appears to be most consistent with the mandatory requirements of the Clean Water Act and the intent of Congress to protect, restore, and maintain water quality, not merely the uses of water. ICWP believes that a strong antidegradation policy must be maintained.

7. Protection of Outstanding National Resource Waters

The existing provisions provide for special designations to protect outstanding national resource waters. The proposed change would eliminate this provision and retain Section 510 of the Clean Water Act which provides this flexibility. The outstanding national resource waters designation has provided assistance which has been particularly important where streams or water bodies are an interstate resource and individual State special designations may not be sufficient. Many States wish to see this provision retained.

8. General Policies

The existing regulations do not recognize general policies applicable to States' water quality standards. The proposed changes

would encourage States to adopt statewide policies applicable to a State's water quality standards.

ICWP believes that since these policies are optional, they may more appropriately be contained in the Handbook or other guidance documents, in order to provide for a clear and concise set of mandatory regulations.

9. Review and Approval

The existing provisions grant authority to the EPA Regional Administrators to approve or disapprove any proposed revisions of water quality standards by the States in accordance with the provisions of Section 303(c)(2) of the Clean Water Act.

The proposed changes in this provision attempt to define what information, analyses, and documentation, supportive of a change, must be submitted by the States in making these decisions and encourages prior consultation with EPA to expedite review and approval.

ICWP endorses the attempt to identify the steps in the review and approval process and the documentation necessary to support modifications of State water quality standards as an effective means of expediting decisions, of lessening any resulting tensions from delays and misunderstandings, and as a guiding process to the States in initiating changes and modifications. ICWP is in general agreement with the process outlined and favors the requirement placed upon EPA to follow the same requirements in promulgating standards as is required of the States. ICWP does, however, strongly recommend the following exceptions; previous comments may also be applicable:

1. Select Priority Water Quality Limited Stream Segments for Water Quality Standards Review--EPA cannot change the priority decisions of States in selecting water bodies for standards review.

2. Revise Use, Revise Criteria, and Adopt a New Water Quality Standard for the Stream Segment--Both States and EPA should share the burden of justification of less stringent standards. Disapproval of State standards by EPA should include specific technical and socioeconomic justification.

3. Develop Segment-Specific Criteria--The recommendations should be amended to allow for targeting of statewide and basinwide issues in the review process, as well as priority segment-specific issues. Also, in development of criteria, each State should be allowed to target priority pollutants for which limits will be a part of the standards.

4. Public Hearings--Participation by all interested and affected parties is a vital part in all phases of a State's water quality management program, including the development and implementation of water quality standards for designated uses. The State should have discretion over specific public involvement and review processes, but the requirement should remain mandatory.

5. State/Federal Roles--States should not have to justify to EPA through the required analysis the setting of water quality standards which exceed the minimum requirements of the Clean Water Act. EPA shall not be given the authority to discourage or disapprove State proposals for higher uses and criteria than required as being unrealistic or too costly for compliance in the view of EPA.

6. State Resource Impacts--The process for adopting State water quality standards proposed in the draft regulations will in many instances place a significant financial and technical burden upon some States. More responsibility should also be placed upon EPA to assure a reasonable level of consistency among the States, reflective of regional and other differences. Absent EPA funding, States may only try to attain a minimum level of achievement and not strive for restoration and enhancement of water quality.

   EPA should carefully consider the ability of each State to effectively administer the standards process, in light of the need for that State to address serious water quality problems with consideration to present and future funding levels for State assistance. EPA must make a financial commitment to the program if it is to be successful.

INTERSTATE CONFERENCE
ICWP
ON WATER PROBLEMS

September 16, 1983

The Honorable Robert A. Roe
Chairman
Subcommittee on Water Resources
Committee on Public Works
and Transportation
U.S. House of Representatives
Washington, D.C. 20515

Dear Congressman Roe:

On behalf of the State and interstate water officials, the Interstate Conference on Water Problems appreciates the opportunity to provide comments on H.R. 3282, the bill to amend the Clean Water Act.

ICWP is the national association of State, interstate, and intrastate officials concerned with the full range of water issues relating to management, conservation, and development. ICWP was established in 1959 and has served for many years as a policy advisory group on water matters to the National Governors' Association. The purpose of ICWP is to facilitate cooperation, consultation, and exchange of information among State, interstate, and intrastate officials and agencies as to the conservation, use, development, and administration of water and related land resources, the law governing these matters, and Federal-State relationships.

While ICWP supports many of the principles of H.R. 3282, the enclosed statement expresses ICWP's concern regarding several specific provisions of the bill. Provisions of concern to ICWP include the bill's sections on water quality standards, the Section 404 dredge or fill permit program, and dams as point sources of pollution.

ICWP's Annual Meeting is being held in Oklahoma City September 19-22, and we regret that, for this reason, we are unable to testify in person on this important legislative proposal. The enclosed statement and attachments are hereby respectfully submitted for the record. If the Committee has questions regarding the statement, ICWP's Washington, D.C. office will be pleased to provide further information.

Thank you for your consideration of ICWP's views.

Sincerely,

Henry Silbermann

TESTIMONY OF THE INTERSTATE CONFERENCE ON WATER PROBLEMS

BEFORE THE

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

SUBCOMMITTEE ON WATER RESOURCES

CONCERNING

HR 3282, AMENDMENTS TO THE CLEAN WATER ACT

The Interstate Conference on Water Problems is the national association of State, interstate, and local water administrators who are responsible for the conservation, development, and management of water resources. We embrace State and Federal programs which will restore or maintain water quality in order to enhance indigenous aquatic life and water supply uses where such water quality is attainable. Water quality should also support such additional instream or withdrawal water uses as are adaptable to each body of water and consistent with State water use plans. The water quality objective should be to protect water resources and aid water use.

Consistent with this objective, ICWP believes that a balanced water quality and quantity management program will provide environmentally sound protection of the nation's water quality, but in doing so, will not restrict legitimate water use, discourage conservation and reuse of waters, conflict with State water use plans, or prevent authorized water use development.

Practically any water use can affect water quality. Examples range from the obvious discharge of municipal and industrial wastewater; through storm runoff from urban, agricultural, and stripmined lands; to maintenance dredging of waterways and the effects of commercial and recreational vessel traffic; and to the less obvious effects of diversion, impoundments, groundwater pumping, and groundwater recharge. These effects mean water quality planning cannot be done apart from water use planning. Each must support the other. Water quality standards should be formulated to recognize the quality changes inherent in water development and utilization.

Coordinated planning of water use and water quality is unavoidably difficult. There are complex relationships between quality and use that must be understood. There are trade-offs that must be

identified and decisions that have to be made. The results will precisely define water uses that are necessary and achievable, along with water quality standards that will support those uses.

Most of this planning and standard setting remains to be accomplished; however, the legal framework is in place. The Clean Water Act stresses sound planning, sets national goals, and provides workable and enforceable tools to implement plans. That is as much as law can do. Federal statutory law should not dictate the outcome of planning, set standards that must be achieved, designate uses which must be maintained, or prohibit certain uses unless such standards or uses are unquestionably applicable nationwide. These views are particularly pertinent to three sections in HR 3282:

- Section 6 concerning water quality standards;
- Section 10 concerning the 404 permit program; and
- Section 11 concerning water quality effects of dams.

WATER QUALITY STANDARDS

A new subsection (B) is proposed to §303(c)(2) that requires designated uses in effect on January 1, 1983 to be maintained unless a State demonstrates that three attainability requirements cannot be met. ICWP has serious problems with this proposal.

It should be recognized that uses and standards can, and should, change over time. We are a dynamic nation, and our water quality standards and planning program must be dynamic to meet changing needs. Freezing designated uses at any point in time would be a bad public policy, and likely counter-productive.

Further, there is nothing sacred about the uses designated as of January 1, 1983. In some cases, the uses in place reflected a great deal of prior State consideration and planning. But in other States, water quality planning was not as far along, and the uses as of early 1983, were only preliminary and interim designations. In some cases, the designated uses may not exist, or have any potential to be achievable. Further planning in most States will confirm or revise these use designations to reflect real facts. Where States are undertaking this process, they should be allowed to proceed without interference. ICWP agrees that the three attainability criteria are valid, but economics alone is an insufficient test of attainability. This is not a complete list. Absent is any consideration of the physical nature of a water body and water quantities which can restrict or even preclude most water uses, regardless of water quality. This proposal will essentially prevent the type of planning and standards revision provided for in the Clean Water Act. The proposal should be dropped.

A new subsection (C) is proposed to maintain water quality in excess of that needed for designated uses. This is a non-degradation policy that again prevents standard setting through a sound planning process. But blanket adoption of non-degradation can have worse consequences than being purposeless. It can prevent designated uses from taking place because a simple water use, in itself, may be the direct cause of the change in water quality. Examples are a temperature change caused by a water supply reservoir, an increase in chlorides from the treated wastewater of a municipal system, and an increase in total dissolved solids resulting from conjunctive use of groundwater. None of these changes significantly affect designated uses if kept within the limits of properly formulated water quality standards. It can be seen that a non-degradation policy of this type is the antithesis of planning for water quality and water use. It overrides planning to dictate an outcome that prevents needed water use and may result in waste of scarce resources.

A new subsection (i) is proposed to §303. It is a slightly different non-degradation policy than discussed above. It demands that existing uses be maintained no matter what happens. Why should existing uses always be preferred to planned future uses? As water administrators involved in the continuing process of allocating and re-allocating water use, we know that conditions affecting water use and needs change. Water use can change dramatically, for example, when an agricultural region urbanizes or industrializes. Thus, ICWP must strongly oppose freezing water use to any particular pattern or point in time.

This same subsection proposes non-degradation of "waters of exceptional recreational or ecological significance". Such a statement is unnecessary. Exception waters will be recognized as such in most States' planning processes and the uses will be protected by appropriate standards. But those standards will recognize the need to protect recreational use, and also the impact of water quality on such recreation uses. Unfortunately, the proposal, again, tries to dictate a particular outcome, and would work contrary to public interest.

SECTION 404 PERMIT PROGRAM

A new subsection (B) is proposed to §404(b). It specifies decision rules for the Secretary of the Army. He shall prohibit specification of a disposal site if there is an unacceptable adverse effect on the aquatic environment and/or a practical alternative to the proposed discharge. These rules are part of the current 404(b)(1) guidelines and are very difficult to apply.

The proposed legislation is worse still because it lifts decision rules out of the context of the body of the guidelines. The decision rules become totally unrelated to water quality, water quality standards, and designated water uses. Moreover, the "aquatic environment" and "unacceptable adverse effect" have no frame of reference. How can the rules be applied?

Every body of water contains a broad variety of aquatic environments. Some of these environments are very important to indigenous aquatic life, but others are not. Aquatic life, therefore, is a frame of reference. But this is not enough for a workable and understandable regulatory program. The aquatic life to be protected ought to be embodied in designated uses and supported by appropriate water quality standards. Then permit evaluation becomes a relatively simple and rapid process. This section should be dropped.

Six new subsections are proposed for §404(q). These deal with time limits, interagency coordination, and internal relations of the Corps of Engineers and Department of the Army. ICWP recognizes there are problems with time limits and interagency coordination. If the agencies are unable to work this out, Congress certainly should impose reasonable requirements.

While recognizing the authority of Congress to organize and oversee the Federal agencies, ICWP would offer some caution regarding the possible over-specification of internal delegation and reporting relationships. The Executive Branch should be left with sufficient flexibility to meet and address changing conditions and future needs, if the program is to prove efficient in the long run. In the processing of permits, ICWP supports increased flexibility for the District Engineer in negotiating with the individual States on matters such as time frames, processing schedules, joint application and notice, and cooperative field investigation and enforcement.

Congress should decide whether responsibilities under the Clean Water Act are delegable or not. If delegation is allowed, it should apply to all agencies. The public needs to know what delegations are made. This can be easily satisfied by agency rulemaking.

ICWP urges the Congress to review the provisions in the Act for State assumption of the §404 program. We are pleased to work with the Committee in determining what must be done to encourage States to assume this program.

In 1979, ICWP, through the Water Resources Council, conducted an extensive survey of the capabilities of the States to conduct programs equivalent to those mandated by §404. The States raised many questions regarding the scope of the regulations, the conflicts

with existing State programs, the overall practicability of the regulations, and the efficiency of these regulations in effecting improvements in the quality of the waters they were designed to regulate. The issues raised in 1979 remain valid today.

Fully thirty-four of the fifty States indicated a preliminary interest in seeking delegation. This interest was tempered by several considerations:

- the need for a temporary program of Federal grants to aid the development, start-up, and expansion of State permit programs for assumption;

- that any legislation to permit delegation also provide the necessary flexibility to permit recognition of the unique physical and hydrological characteristics of the respective States;

- that delegation to States be complete, providing for general oversight by the Federal agencies rather than an over-the-shoulder permit-by-permit review;

- that where possible, existing State administrative and permitting procedures be honored, with Federal evaluation of these procedures being directed to the desired objective, not the precise process;

- that any delegation be preceded by a written understanding for resolving intergovernmental disagreements prior to the public hearing process; and

- that any delegation plan provide for a recognition of the variety of State programs which may be used to achieve the objectives of this area of water quality.

ICWP is pleased to submit for the record excerpts of significant findings of this report.

WATER QUALITY EFFECTS OF DAMS

The water quality effects of dams is an issue that was recently litigated in Federal courts. The legal issue was whether discharges from dams should be regulated by NPDES permits under §402 of the Clean Water Act. This argument was rejected. Dams and reservoirs can cause a variety of water quality changes depending on the design and operation of discharge works, the likelihood of thermal stratification, and the quality of reservoir inflow. Design

and operation techniques to avoid the rare problems are known and widely employed.

On July 28, 1982, Mr. Kenneth Dunn of Idaho and I were privileged to testify before this Subcommittee on this issue. At that time we presented the results of ICWP's survey of the States regarding existing State mechanisms for regulating and taking into account the water quality impact of dams. I am pleased to submit for the record a summary of the survey results.

The survey indicated that the water quality problems of dams can be and are addressed by programs operated under State law. For example, it is already a widespread practice among States to coordinate the review of permit applications or project proposals for dams or reservoirs with State water quality activities, State fish and game agencies, and the U.S. Fish and Wildlife Service. Also, many States reported that, should an existing dam or reservoir contribute to or cause pollution, it is subject to regulation and corrective action.

It is ICWP's view that dams are and should continue to be evaluated on a case-by-case or site-specific basis, and subjected to water quality management control when it is determined that water pollution results from a project. Under existing State law and mechanisms, water quality protection can be achieved where needed and feasible.

Should Congress choose to request a further study of this issue, it is urged to include in its request for a study the requirements that EPA, in cooperation with State water resource officials, report on the existing procedure (both formal and informal) within States to take account of the water quality impacts of dams, the interrelationship between achieving water quantity (resource) objectives at a dam and water quality objectives, and the potential impacts on the achievability of the primary purposes for which a dam or reservoir was constructed if water quality objectives are given priority.

In addition to the involvement of State water resources officials, ICWP recommends that important water quantity agencies such as the Corps of Engineers, the Bureau of Reclamation, and the Soil Conservation Service, be full and equal partners with EPA in the design and implementation of any such study.

The Committee on Public Works and Transportation is already familiar with the essential role of dams in the development and utilization of water resources. There are many regions of the nation where ample water supplies cannot be obtained by any other means. Thousands of miles of navigable waterways also depend on dams. The proposed study could improve an understanding of the relations between water use and water quality and the need for coordinated planning.

SUMMARY

Throughout this testimony we have shown that water use and water quality are not independent matters. Water uses have quality needs and water use itself can affect quality. Planning for both must be coordinated. This is a continuing process, because new water use needs will emerge and prior water uses must be changed.

ICWP supports the principle of non-degradation. However, we have shown the difficulty of drafting a workable non-degradation policy. Rather, the principle should be a primary objective of water quality planning.

The Clean Water Act provides the legal framework for this planning, but the work has only begun. Nevertheless, sound planning is the best assurance that the nation's water use needs will be met and that water quality will be restored and maintained to support water use. On the other hand, any action to freeze water quality standards or uses is the antithesis of planning to meet water use needs. What could be more intolerable than to waste water and financial resources and not meet water needs?

ICWP appreciates the opportunity to testify on this matter. We will continue to support and assist water quality programs in any way we can.

ICWP maintains an office at 21 DuPont Circle, N.W., Suite 600, Washington, D.C. 20036 headed by Joan M. Kovalic, Executive Director and General Counsel.

NOTE:

The Main Report and Appendices of the ICWP survey of states relating to Section 404 and Section 10 programs are out of print.

Because interest in the results of this ICWP survey continues, we have reproduced portions of the survey results which are presented herewith as "SIGNIFICANT FINDINGS."

Henry Silbermann
ICWP Secretary-Treasurer
July 15, 1982

PREFACE

State water resources administrators throughout the Nation have a significant interest in the actions of the U.S. Army Corps of Engineers, the U.S. Environmental Protection Agency and the other involved Federal agencies regarding implementation of the rules and regulations for Section 404 of P.L. 92-500 (Federal Water Pollution Control Act Amendments of 1972).

The States have raised many questions regarding the scope of the regulations, the conflicts with existing State programs, the overall practicability of the regulations, and the efficiency of these regulations in effecting improvements in the qualities of the waters they were designed to regulate.

The U.S. Army Corps of Engineers, cognizant of its responsibilities under P.L. 92-500 and the need to lessen, as far as practicable, redundancy in the programs of State and Federal government, contracted on December 29, 1975 with the Interstate Conference on Water Problems (ICWP) through the U.S. Water Resources Council (WRC) to explore the capabilities of the States to conduct programs equivalent to those mandated by Section 404 of P.L. 92-500 and the pertinent Court mandated Federal regulations and guidelines.

This final report to the Corps of Engineers constitutes the result of that effort.

The States' participation in the survey which provided the date for this report is evidence of the overwhelming concern of the States regarding the regulations governing implementation of Section 404. All 50 of the "constitutional States" and three of the territorial entities provided information for the survey of State programs affected by Section 404. (Forty-nine States and three territorial entities completed the survey questionnaire; one State (California) submitted more general comments which are not part of the qualified survey results).

The conclusions and findings contained in this report are the sole responsibility of ICWP and are based on factual information provided by respondents to a comprehensive questionnaire. The information received was compiled, catalogued, and evaluated by an ICWP Task Force on Navigable Waters which also prepared this report.

20-955 O--84——142

CHAPTER I - INTRODUCTION

1. Background

P.L. 92-500 (The Federal Water Pollution Control Amendments of 1972) greatly expanded the activities of the Federal government in controlling pollution in the waters within the geographic boundaries of the United States. Many of the waters that have previously been considered the sole jurisdiction of the States are now included within the regulatory confines of the Federal government in accordance with this Act. Because of the active role that many States had taken in the years previous to enactment of P.L. 52-500, many of the waters within the boundaries of the States are now subject to dual management by both the State and Federal governments.

The States, in numerous cases, have taken an active role in the development of regulations which govern the use and development of shore land, stream beds, wetlands and other areas adjacent to water courses and lakes. These rules and regulations of the States have developed over an extended period of time and have a firm basis in the laws of the States. State officials have expressed concern regarding the general expansion of Federal regulatory authority in these areas well before the most recent Court decision and the subsequent Corps of Engineer's regulations "Permits for Activities in Navigable Waters or Ocean Waters," which were promulgated as "Interim Final" on July 25, 1975. With regard to these specific regulations many State officials have declared publicly that the Corps' program for implementation of Section 404 activities, as it now exists, is an unwarranted and unjustified intrusion by the Federal government into State programs and responsibilities.

The Interstate Conference on Water Problems (ICWP) has been specifically concerned with the implementation of Section 404 because of its potential impact on the existing State regulatory programs. The States have been involved in the management, development, and control of waters within their boundaries for an extended period of time. This is true not only in the West, where water management is most critical to the maintenance and enhancement of the economy, but also in the East where the problems of the more fully industrialized areas are evidenced.

ICWP has been interested and involved in the development and implementation of the programs of the Corps of Engineers under Section 10 of the Rivers and Harbors Act of 1899 and Section 404 of P.L. 92-500 because of their broad impact on the ability of the States to regulate and utilize waters within their boundaries. The ICWP Executive Committee and ICWP State members have taken an active role in commenting on the proposed Federal regulations relating to these programs. In addition, ICWP has worked cooperatively with the National Governors' Conference and other interested groups to assist in developing summary input to the Federal agencies to inform them of State views and assist the Federal agencies in implementing workable programs.

appropriate to their particular and peculiar situations and to best meet the needs of their citizens. This information can also be of assistance to the States as they determine what the most effective course of action will be for their future programs. The States will now have an opportunity to develop a most effective implementation plan as well as the necessary legislative authorizations.

The survey report in this document was performed by ICWP in its role as Standing State Advisory Committee to the U.S. Water Resources Council (WRC) under direct contract with the U.S. Army Corps of Engineers in order to continue and expand the States input on these critical issues.

ICWP, in preparation for this study, reviewed the implementation of Section 404 with a number of ICWP members. It was the position of the members contacted that, in order to assure the program of regulation under Section 404 met the intent of Congress and the needs of the citizens, the Section 404 regulations should be:

1. Administered in conjunction with or in full cooperation with existing and emerging State programs, or

2. Be fully delegated to the States to ensure a minimum of duplication of effort and a minimum of governmental expenditure at all levels.

ICWP also maintains as a basic premise to this study that: 1) The States through their Constitutions and acts of admissions have the authority to regulate the beds and streams of the waters within their boundaries, 2) The States essentially agree with the premise of P.L. 92-500, which was to regulate, confine and otherwise deal with pollution at its source, regardless of the type of pollution regulated, 3) The States agree with the general objectives and policies outlined in Section 101 of P.L. 92-500 which indicates the intent of Congress is that the States should have the primary responsibility in the administration and implementation of pollution control programs and that to the maximum extent possible procedures utilized for implementing the Act should encourage minimization of paper work, and 4) The States agree that there is a continuing need to regulate the placement of fill material and other solid and suspended pollutants in their waters.

From the beginning consideration of this study it was understood by ICWP and the Corps of Engineers that the analysis of relevant State programs would not be an easy task due to the diversity of State approaches to the several issues involved in this regulation. It was recognized that the States have chosen, due to their regional diversity and special needs, to enact legislation in these areas in an incremental sequence. It was further understood that this incremental approach would likely lead to programs of different capabilities with different emphasis.

ICWP chose to accept the offer to contract with the Corps of Engineers through WRC because of the need for the States to have available information on their programs in comparison to those of other States. It was assumed that this information would permit each State (Governor, Legislature, and State agency administrators) to make informed judgements on the programs and administrative processes most appropriate to their particular and peculiar situations and to best meet the needs of their citizens. This information can also be of assistance to the States as they determine what the most effective course of action will be for their future programs. The States will now have an opportunity to develop a most effective implementation plan as well as the necessary legislative authorizations.

2. Project Coordination

The Interstate Conference on Water Problems (ICWP) is a national association of State, intrastate and interstate officials concerned with water resources administration. ICWP was established in 1959 as an outgrowth of regional conferences on water problems as recognized in the same year by action of the General Assembly of the States.

ICWP, as an independent association of water officials, works cooperatively with the National Governor's Conference, the National Conference of State Legislatures and the Council of State Governments and serves as an advisory body to other associations of government officials in the area of water resources management, development and conservation.

The purpose of ICWP is to facilitate cooperation, consultation and exchange of information among State, intrastate and interstate officials and agencies as to the conservation, use, development and administration of water and related land resources, the law governing these matters and Federal-State relationships in the field of water and related resources; and, to the extent feasible and desirable, to promote a consensus of harmonizing of State and intrastate views on any subject within the purview of ICWP, and to present and disseminate such views.

Participants in ICWP are State officials serving as a result of election, by statute or by designation of their respective States. The Executive Committee of ICWP is selected by the entire membership, and is representative of all interests of ICWP.

The Water Resources Planning Act of 1965 (P.L. 89-80), in establishing the U.S. Water Resources Council (WRC), declared a policy of close cooperation between the WRC and the States in coordination of planning for use of the Nation's water and related land resources. WRC provides a vehicle for considering and coordinating the diverse views of the Federal mission-oriented agencies and for compiling information on the water resources problems and needs of the different regions within the United States.

In order to more effectively carry out the policy of cooperation with the States, WRC established a Standing State Advisory Committee (SSAC) in 1971. Since 1971 the SSAC has been renewed and chartered in accordance with the Federal Advisory Committee Act of 1972. The SSAC is thereby authorized to render advice and services on State views on water related policy and programs to the Water Resources Council and its member agencies.

The specific objective of the SSAC is to provide for increased participation by the States in the development of policies and procedures for the conservation, development and utilization of water and related land resources of the United States, and to provide WRC with the views and opinions of State interests on matters of concern to WRC and the States.

The U.S. Army Corps of Engineers, determining that the implementation of Section 404 involved the agencies of several of the Federal departments, requested that WRC permit the SSAC (ICWP) to provide input to the Corps of Engineers and the other agencies on the relative capability of the States. In its request to WRC's Council of Representatives, the Corps of Engineers stated:

> "The need for reasonably complete coverage and for acceptable accuracy dictates use of an existing means of reaching the States and assembling the information. The Standing State Advisory Committee (SSAC) to the Council seems ideally suited to this effort, and we would like to ask the Committee and the Interstate Conference on Water Problems (ICWP), which it represents, to accept the assignment."

Discussion of the Corps of Engineers request took place at WRC's Council of Representatives meeting on December 17, 1973. At that time it was indicated that the SSAC, through ICWP, had performed several surveys of the States with a very high level of participation by the States. The survey previously performed had a high level of acceptance, both by the Federal agencies and the States that participated in the surveys.

Following the general discussion by WRC's member agencies, the Council of Representatives concurred in the recommendation presented by the Corps of Engineers that SSAC (ICWP) be permitted to accept the task of providing the Corps with a report on the capability of the States to administer Section 404 of P.L. 92-500.

3. Contract Agreement

The ICWP-WRC-Corps of Engineers contract was executed on December 23, 1975 for the specfic purpose of specifying the arrangements under which the SSAC (ICWP) would provide information to the Corps of Engineers on the capability of the States to assist in implementing Section 404, P.L. 92-500.

The specific responsibilities of ICWP were listed in the contract as follows:

1. To develop a survey questionnaire designed to gather the necessary information from the States in order to prepare a report on the present capability of the States to assist in implementing Section 404 of P.L. 92-500. (The Corps of Engineers retained final concurrence authority on the questionnaire, prior to circulation to the States. The Corps of Engineers also identified other Federal agencies as being potentially involved in the Federal administration of Section 404. These agencies were provided with drafts of the questionnaire and participated in the Corps review of the questionnaire prior to its distribution.)

2. To circulate the questionnaire to all States for their completion, and to perform the necessary follow-up to assure that the questionnaires were processed.

3. To prepare a report on the present capability of the States to assist in implementing Section 404 of P.L. 92-500.

4. To provide to the Corps of Engineers, following the final summary report, one copy of all supporting material including completed questionnaires to the Corps of Engineers.

5. To provide such other reports to the Corps of Engineers as may be necessary to assist in inter-agency communications regarding the development of alternate implementation plans for Section 404 of P.L. 92-500.

It should be noted that several preliminary reports were prepared including a preliminary report submitted to the Corps on approximately April 1, 1976. These reports were discussed with the Corps of Engineers, and representatives of ICWP assisted the Corps in describing the study results to the affected Committees of Congress and associated Federal agencies.

Periodically the Corps has requested preliminary information to assist them in providing input to the Office of Management and Budget and the Office of the Secretary of Army. This information has been provided on a request basis and has been distributed to the other Federal agencies involved and to the appropriate Congressional Committees. This special information, while not a stated part of the agreement between the Corps of Engineers and ICWP has been of great importance in the overall decision-making process regarding potential amendments to P.L. 92-500.

In addition to these preliminary reports, the Corps of Engineers requested that representatives of ICWP be available during the course of House Pulbic Works and Transportation Committee mark-up sessions on H.R. 9560, proposed Amendments to the Federal Water Pollution Control Act.

All of these activities have been performed within the confines of the original contract agreement and within the confines of the original funding constraints.

4. Survey Methodology

The Interstate Conference on Water Problems (ICWP) was involved with numerous review activities regarding the July 25, 1979 interim final regulations of the Corps of Engineers for implementing Section 404 of P.L. 92-500. ICWP was also involved in review of the guidelines for implementation of Section 404 prepared by the Environmental Protection Agency. These activities were coordinated through the National Governors' Conference with ICWP representatives participating in the National Governors' Conference Special Task Force on Section 404. During the course of activities in this Special Task Force, several persons involved suggested to the Corps of Engineers that additional information was needed on the capabilities of the States to participate in the implementation of Section 404. At that time no possiblity of delegation of the Section 404 program to the States for implementation existed. However, the National Governors' Conference Task Force indicated that the States could and would contribute their expertise to the efficient implementation of this program.

Following the implementation of the Section 404 regulations and guidelines, additional conversations with regard to State participation ensued between the Corps of Engineers, the National Governors' Conference and ICWP.

During this same period of time, ICWP identified several of its Executive Committee and other State members who indicated a special interest in the further refinement of procedures for implementation of Section 404. These ICWP members were formed into a Task Force on Navigable Waters and volunteered their services to continue necessary review of this program. Members of the Navigable Waters Task Force included representation from State agencies that operated integrated programs including both water quality and water resources management programs. These Task Force members were selected to assure that consideration of both water quantity and quality issues would be given full hearing during the course of any Section 404 review.

The ICWP Task Force on Navigable Waters indicated a continuing interest in determining the States' capabilities to implement Section 404 type programs. They also encouraged the ICWP Executive Committee to communicate this desire to the Corps of Engineers and representatives of the National Governors' Conference. In addition, members of the ICWP Task Force also provided initial questions which might be used in a questionnaire to determine the States' capabilities, should such a questionnaire be developed.

As a result of this preliminary activity by the ICWP Task Force, and with the urging of the National Governors' Conference, a representative of ICWP was invited to participate in a meeting called by the Corps of Engineers on November 21, 1975 to review the possibility of surveying the States; capabilities in programs similar to or equivalent to the Section 404 program of the Corps of Engineers. Participants at the November 21 meeting, included representatives of the National Governor's Conference, the Office of Coastal Zone Management (CZM) - U.S. Department of Commerce, the U.S. Environmental Protection Agency (EPA), and the Corps of Engineers requested that a draft questionnaire be developed by ICWP and submitted to the Corps. It was assumed

that a questionnaire survey of the States would be accomplished by the Corps of Engineers, one of the other involved Federal agencies, or by an outside organization. The Corps of Engineers also requested that ICWP submit a preliminary proposal to conduct the survey of the States on programs relating to Section 404 of P.L. 92-500.

The initial preliminary draft survey questionnaire and the proposal to conduct the survey were subsequently submitted to the Corps of Engineers on November 25 for the Corps' review and comment. Discussions were conducted during the month of December regarding further details of the proposed contract between the Standing State Advisory Committee (SSAC) to the Water Resources Council (WRC) and the Corps of Engineers. A final contract for the conduct of this survey and preparation of the report was executed on December 29, 1975.

Development Of The Questionnaire

Development of the final questionnaire document (See Exhibit A.) began with the first formal meeting of the ICWP Task Force on Navigable Waters held December 29-31, 1975 in Washington, D.C. Members of the ICWP Task Force were provided with comments from the Corps of Engineers. These comments represented the coordinated response of the Corps of Engineers, EPA, and CZM. ICWP Task Force members reviewed the questionnaire, proposed attachements and instruction for the questionnaire, and developed a final suggested questionnaire for presentation to and approval of the Corps of Engineers. A meeting was held on the afternoon of December 30 to review the proposed questionnare. Attendees at this meeting included a representative of the National Governors' Conference, EPA, the Corps of Engineers, and the ICWP Task Force on Navigable Waters. At the conclusion of this meeting, initial approval of the questionnaire was given by the Corps of Engineers subject to minor corrections by the ICWP Task Force in consultation with the Corps of Engineers.

During the period of December 31, 1975 and early January, 1976 a number of corrections, changes, adaptations, etc., were made in the questionnaire forms, the instruction sheets and the explanation paper. All such changes were reviewed with the Corps of Engineers prior to printing of the materials for distribution to the States.

Distribution Of The Questionnaire

On January 9, 1976 the questionnaire and supporting materials were distributed to:

1. State water resource administrators (with original covering letter)

2. State water pollution control administrators (with original covering letter)

3. Governors (under covering memorandum from the National Governors' Conference)

(Copies of the original covering letters, the memorandum from the National Governors' Conference, and all questionnaire and instruction material distributed to the States is contained in Appendix II. of this Report.)

In addition to the National Governors' Conference memorandum, ICWP sent an immediate follow-up letter to the Governor of each State, encouraging them to coordinate the response from their State agencies. Also attached to this Governor's letter was a list of the individuals in their State that had received the questionnaire material.

In order to assure the greatest visibility and response of the States to this survey questionnaire, copies of the questionnaire were also sent with a covering memroandum to the following organizations and offices:

1. Task Force on Natural Resources and Environmental Management, National Governor's Conference.

2. ICWP Associate Members

3. Council of State Governments Regional Offices

4. River Basin Commission Chairmen

5. ICWP Executive Committee Members

6. Western States Water Council

7. U.S. Water Resources Council

8. Selected staff members of the Office of Coastal Zone Management, and the Environmental Protection Agency.

A total of more than 250 copies of the questionnaire and supporting materials were distributed to the States and agencies of the States in the initial distribution. Of these 250, more than 200 were sent directly to Governors and administrators of State agencies to assure the comprehensive coverage which resulted in the 100% response from the States received by this survey.

It should be noted that on January 19, 1976 Governor J. James Exon (Nebraska) also sent a personal letter to each of the other Governors encouraging them to coordinate and expedite their State's response to this survey questionnaire.

In order to assure full understanding of the questionnaire and its importance to overall the survey, each member of the ICWP Task Force was assigned a group of States for follow-up contact. These follow-up contacts were performed prior to January 31, 1976. In addition, the addresses and telephone numbers of the ICWP Task Force members were published in the survey instructions and many States took advantage of this opportunity to contact Task Force members directly to receive additional interpretation of the survey questions. This procedure provided an opportunity for direct contact between those intimately

familiar with the development of the questionnaire and the specific objectives of each question to clarify any potential misunderstandings prior to completion of the individual questions. In addition, this procedure provided an early identification of potential issues which had been overlooked in the questionnaire, and of questions which were not directly relevant to the objectives of the study.

At all times during the course of the survey and questionnaire completion every attempt was made to obtain factual information from the States as free of prejudice and bias as possible. Continuing efforts were made to assure that the States would provide accurate information, without regard to the ultimate conclusions of the survey.

Processing And Verification Procedures

Completed questionnaire forms and supplemental materials were transmitted to the ICWP Office in St. Paul, Minnesota. Supplemental materials were classified upon receipt as:

1. Legislation (laws)

2. Rules and Regulations

3. Other materials

Following this classifications the specific titles were entered on a supplemental material record by classification. The supplemental materials record for each of the entities participating in the survey are included in this report as Appendix II. The actual documents submitted and itemized in this report will be submitted to the Corps of Engineers for reference and file purposes.

Upon receipt of the completed survey questionnaire, the ICWP Project Coordinator reviewed the information submitted for consistency and formed a "desk validation" based on key questions identified by the ICWP Task Force. Any internal inconsistencies or voids in information were checked with the individual completing the State questionnaire response. When information was inadvertently ommitted, the States were requested to submit this additional information. Where internal inconsistencies in the information were identified, States were requested to resubmit their information after validation with their respective State agencies. In no case was information changed or any way altered without confirmation from the State agency official providing the information.

All States, with the exception of California, provided ICWP with a completed questionnaire. California provided a letter submission which was not otherwise quantifiable into the questionnaire format.

When States submitted information from only one agency, an attempt was made to verify that that was the only agency operating programs which were defined as "similar to" or "duplicated in part or in whole" by the Section 404 program. When additional agencies were identified, a request was made by the ICWP Project Coordinator that the additional information be provided for inclusion in the survey.

Following the desk validation of the survey information, a copy of the questionnaire was forwarded to the Nebraska Natural Resources Commission for computer coding and processing. Where necessary, annotations were provided by the ICWP Project Coordinator for the purpose of clarifying the response of the State for input into the Computer system.

Before processing the information for the computer, the input data was proofread and verified by staff members of the Nebraska Natural Resources Commission. Following the data input the information was again verified by the Nebraska Natural Resources Commission staff. A final verification of the computer input information was also carried out by the ICWP office.

In order to provide additional verfication of the final computer processed information, partial printouts involving selected States were returned to those States for their review. The States were requested to review the information and compare it with the data that they had submitted on the origianl survey questionnaire form. States participating in this verification activity reported that the information appearing on th computer printout accurately reflected the information they had submitted and requested no changes in the computer processed information.

(A detailed description of the data processing procedures utilized by the computer terminal staff is contained in Appendix I. of this report.)

It should be noted that all information on Questionnaire Form A was verified. Because of the nature of the information Questionnaire Form B, it was extermely difficult to verify 100% of the information. It should be noted, however, that almost no errors were found in the Form B information and for the portion of the Form B information verified, no errors were identified. Form B information relating "Dollar Expended, Man-Power Applied, and Permits Issued," however, was not verified and must be considered of limited validity.

CHAPTER II - SUMMARY RESULTS

1. Conclusions

The purpose of the Contract between the Interstate Conference on Water Problems (ICWP) and the Army Corps of Engineers was to:

1) Determine the scope of State program regulating activities in water courses and water bodies in ways similar to or duplicative of those regulations now in force and/or scheduled under the Section 404 and Section 10 program, and

2) To determine the interest of the States in accepting delegation of the Section 404 and Section 10 permit program of the Corps of Engineers.

The States have indicated a clear interest in seeking delegation of the Section 404 program. Thirty-four of the 52 States and territorial entities analyzed have indicated a preliminary interest in seeking this delegatin should the Federal Water Pollution Control Act amendments of 1972 be further amended to permit this delegation. This interest, however, is tempered by several conditions identified by the States. The conditions are as follows:

1) Sufficient Federal funds must be made available to the States on a continuing basis in order to initiate and continue the program. The States anticipate a significantly increased workload should they seek delegation. Even those States that would appear to have programs on line which are more extensive or as extensive as the Corps of Engineers program anticipate additional funds would be necessary in order to fulfill the paperwork requirement of the Corps' program.

In addition, it should be noted that the attitude of the States with regard to Federal initiated programs appears to be changing rapidly. In the past, especially in the late 60's and early 70's, States eagerly accepted new programs and sought legislative approval for changes in State laws which were required by the Federal government. Because of negative experiences with changing Federal approaches to programs involving the States, State administrative officials, Legislatures and Governors are becoming much more reluctant to "jump on the bandwagon" with a new Federal program.

2) The States appear to believe that "one set of national standards" may not meet the objective of the Federal Water Pollution Control Act in this important area. The States are therefore suggesting that any legislation to permit delegation should also permit recognition of the unique physical and hydrological characteristics of the respective States. In essence, this would call for legislation which would permit the Corps to recognize programs of varying scope in the States.

3) The States appear to desire a form of delegation which would be complete, with no reserved authority for the Corps of Engineers. While general oversight would be anticipated, a case by case or permit by permit review would generally be considered objectionable.

4) The States have expressed some concern that the Corps of Engineers procedures are significantly different from those mandated by State administrative procedures now in force in many States. The difficulty in changing administrative procedures which govern all State agencies in order to meet the requirements of delegation for Section 404 programs are perceived to be extremely difficult and perhaps impossible. Again, the States would suggest that the Corps be given latitude to evaluate the States procedures in terms of the objective which they meet, namely the protection of all interests, environmental and applicant.

5) Many States have expressed concern that any delegation should be prefaced by written understanding for resolving intergovernmental disagreements prior to the public hearing process. A number of States have indicated difficulty in other programs when Federal agencies have expressed their concerns and/or objections at the "last minute." The States believe that the lack of such a prior agreement between the concerned governmental agencies can and does lead to a weakening of the regulatory process and thereby a dilution of the objectives the States and Federal agencies are trying to reach.

6) Any plan of delegation must provide for a recognition of the variety of State programs which may be used to achieve the objective in this area of water pollution control. While the Corps of Engineers program provides a single agency responsibility, the States believe in a number of cases that their multiple agency, multiple level of government approach can be as effective as the current Corps program. States have also observed that their programs utilizing a number of agencies may parallel the Federal approach which has the Corps of Engineers as the lead agency with input from many other agencies such as EPA, Fish and Wildlife Service, Office of Coastal Zone Management, etc.

Another area of concern which has been raised during the course of this study is the ability of the States and/or the Corps of Engineers to make decisions in the important area of wetlands regulation. Much of the discussion surrounding the application of Section 404 to wetlands has indicated the "invaluableness" of wetlands. While all respondents appear to be committed to the objective of protecting and enhancing the wetlands, the unanswered questions regarding wetlands appear to outnumber those for which an affirmative declaration can be provided. Such issues as the tradeoffs between wetlands and agricultural land in urban development, the role of wetlands (especially small wetlands areas) in aquifer recharge and in wildlife production appear to be open to serious debate. On the basis of this study, it appears that a great deal of additional work must be done in the area of research to provide clear guidance to regulatory decision-makers in this area.

In discussion of this survey with State officials, it is also apparent that they question the role of the Corps of Engineers in this regulatory activity. While all recognize the ability of the Corps to carry out programs effectively and efficiently, it has been suggested that the expertise of the Corps of Engineers might be more efficiently utilized in the enhancement of navigation, leaving the primary environmental protection and water pollution control activities with the Environmental Protection Agency and its State cooperating agencies.

As the Corps of Engineers representatives are well aware, many State and other officials have questioned the scope of the Section 404 regulations. It appears that much additional research will be required to determine the appropriate jurisdictional scope and reach of these regulations. Many have suggested that the environmental benefit achieved by this regulation may not justify the cost in pulbic and private funds.

The attached tables and appendices provide additional information which further documents the observations included in this summary.

2. Summary Of State Responses

The following information is a summary of the States' response to most of the survey questions asked. This information is based on the response of the 49 States and three territorial entities analyzed.

This summary does not take into account all the survey questions formulated, only those that produce quantifiable results. Further, due to the nature of some survey questions, the 49 States and 3 territorial entities were not always able to respond to each question. Consequently, the results obtained and summarized for a few of the items listed below do not contain the response of all 49 States and three territoral entities analyzed.

The information summarized below does, however, provide a most accurate picture of the capability of the States to assist the Corps in implementing Section 404, P.L. 92-500. For a more specific State-by-State breakdown of the survey results, see Chapter III, Section 2, State-by-State Tabulated Survey Results.

1. State Control

Of the 49 States and three territorial entities analyzed, 49 States and two territorial entities indicated they had programs for the control of activities performed in or near watercourses or water bodies. American Samoa does not have such programs.

2. Programs Identified

In the 49 States and two territorial entities with control of activities performed in or near watercourses or water bodies, 290 programs were identified and then analyzed. This averages 5.7 programs per State with a range from only one program in one State (Missouri) to 23 programs in another (Texas).

3. Duplication

Of the 49 States and two territorial entities with control of activities, in or near water courses or water bodies, 45 States and two territorial entities indicated that their programs in whole or in part were similar or duplicative of activities and regulations in force under Section 404, P.L. 92-500, or Section 10, River and Harbor Act of 1899.

Four States indicated that their programs in whole or in part were not similar or duplicative.

4. Duplicative Programs

Of the 45 States and two territorial entities that indicated their programs were in whole or in part similar or duplicative or of activities and regulations in force under Section 404, P.L. 92-500, or Section 10, River and Harbor Act of 1899, 194 programs were identified as being duplicated in whole or in part by the Corps' permit program. This averages 4.1 programs per State, with a range from only one program in one State (Missouri) to 15 programs in another (Texas).

(The following items (5. thru 26.) are based on the programs identified by the 45 States and two territorial entities in question 2.b. regarding those State programs in whole or in part similar or duplicative or activities and regulations now in force under Section 404, P.L. 92-500, or Section 10 River and Harbor Act of 1899.)

5. Programs Legislation

Of the 194 similar or duplicative programs indentified by the 45 States and two territorial entities, 186 were mandated by State legislation.

6. Objectives

Of the 45 States and two territorial entities identifying programs as being duplicated in whole or in part by the Corps permit program:

37 identified water quality as a "major objective" of some or all of its programs;

32 identified wetlands protection as a "major objective" of some or all of its programs; and

27 identified water supply as a "major objective" of some or all of its programs.

7. Program Areas

The duplicative programs identified by the 45 States and two territorial entities covered 458 different waters. This averages 9.7 different waters covered per State, with a range from only one water type covered in Washington, D.C. to 10 different waters covered in two different States (Massachusetts and Texas). This averages 2.4 different water types per program.

8. Program Authority

Of the 45 States and two territorial entities analyzed, 45 indicated the following combination of authority for its programs:

- Issuance/denial of State permits with conditions attached.
- Detection of unauthorized activities.
- Enforcement of State permits.

9. Activities

The survey indicated 24 specific types of activities which would involve the permanent disturbance of water bodies. Thirty respondents indicated their State or territorial entity has control of 80 or more activities. Twelve respondents indicated their State or territorial entity has control of between 10 and 20 activities (inclusive). Five respondents indicated their State or territorial entity has control of 10 or less activities.

10. General Permit

Eighteen of the 45 States and two territorial entities indicated some type of general permit authority. Twenty-nine of the 45 States and two territorial entitites indicated no type of general permit authority.

11. Permit Consideration

The Corps of Engineers permit regulations require consideration of 16 issue areas prior to the granting of a permit. The 45 States and two territorial entities with similar or duplicative programs indicated they utilized similar considerations as follows:

9 consider all 16 areas;

11 consider 15 areas;

5 consider 15 areas'

4 consider 13 areas;

8 consider 12 areas;

10 consider 11 or less areas.

12. Permit Processing

Forty-six of the 45 States and two territorial entities indicated the majority of the States' programs are vested in centralized State offices. Two of the 47 States and territories (Washington, D.C. and Louisiana) indicated the majority of their particular programs are vested in some other authority.

13. Public Input

Twenty-six of the 47 States and two territorial entities indicated public input on permit applications is obtained in whole or in part through public notices.

Forty-three of the 47 States and two territorial entities indicated public input on permit applications is obtained in whole or in part through required public hearings.

14. Permit Review

In the 45 States and two territorial entities with programs similar or duplicative of those activities in force under Section 404 and Section 10,

176 different agencies were identified as being sent an application for a State permit for review. This averages 3.7 agencies per State with a range from only one agency in two States (Louisiana and New York), to nine agencies in several other States (Alabama, Hawaii, Indiana, Mississippi, and Oregon).

15. Dredge Criteria

Of the 45 States and two territorial entities analyzed, 33 indicated their State or territorial entity has criteria for dredge material. Fourteen indicated they do not have criteria for dredge material.

16. Fill Criteria

Of the 45 States and two territorial entities analyzed, 30 indicated their State or territorial entity has criteria for fill material. Seventeen respondents indicated their State or territorial entity does not have criteria for fill material.

17. Agency Dredging Requirements

Of the 45 States and two territorial entities analyzed, 39 indicated procedures their State or territorial entity include requirements for dredeging or filling operations performed by or for agencies of a particular State. Of this 39, no State or territorial entity indicated these procedures are identical to those required of private applicants.

Eight responses indicated the procedures in their State or territorial entity do not include requirements for dredging or filling operations performed by or for agencies of a particular State.

18. Technical Evaluation

Regarding the State permit processing agencies of the 45 States and two territorial entities:

8 States indicated their permit processing agencies regularly request technical evaluation of permit applications from Universities;

24 States indicated their permit processing agencies regularly request technical evaluation of permit applications from Federal agencies; and,

35 States indicated their permit processing agencies regularly request technical evaluation of permit applications from State agencies

19. Individual Assistance

Regarding the State permit processing agencies of the 45 States and two territorial entities:

43 States indicated their permit processing agencies provide assistance to individual applicants in preparing applications for permits; and

4 States indicated their permit processing agencies provide no assistance to individual applicants in preparing applications for permits.

20. Permit Enforcement

Of the permits issued by the permit programs of the 45 States and two territorial entities, all 45 States provide for the enforcement of these permits by the permit processing agency involved. Both territorial entities analyzed do not provide for such enforcement.

21. Wetlands Definition

Of the 45 States and two territorial entities analyzed, 26 indicated their State or territorial entity defines wetlands and 21 indicated their State or territorial entity does not define wetlands. Twenty States indicated that wetlands were defined for the purposes of their regulatory programs(s).

22. Improved Waterways

Within the 45 States and two territorial entities analyzed, 274 improved waterways were identified. This averages 5.8 per State, with a range from no improved waterways identified in Arizona and Washington, D.C. and 11 improved waterways identified in several other States (Alaska, Massachusetts, New Hampshire and Texas).

23. Emergency Procedures

Of the 45 States and two territorial entities analyzed, 15 indicated that in the majority of their State programs no special procedures for emergency situations are provided.

Twenty-nine respondents indicated that in the majority of their State programs certain special procedures for emergency situations are provided.

24. Applicant Costs

Of the costs applicants are required to pay in the processing of State permits in the 45 States and two territorial entities, 46 indicated applicants are required to pay for preparation of supporting documentation. Thirty-six indicated applicants in their State or territorial entity are required to pay for performance and evaluation of required tests. Twenty-nine indicated applicants in their State or territorial entity are required to pay for preparation of Environmental Impact Assessments or Impact Statements.

25. Environmental Abatement

Of the 45 States and two territorial entities analyzed, 31 indicated their State or territorial entity includes procedures whereby compliance with State approved conditions for offsetting environmental damages are required.

(The following items (26. through 42.) are based on the response of all 49 States and three territorial entities analyzed. These items are not based solely on the State programs identified in survey question 2.b. as being in whole or in part similar or duplicative of activities and regulations now in force under Section 404, P.L. 92-500, or Section 10, River and Harbor Act of 1899.

Due to the nature of many of the survey questions, however, all of the 49 States and three territorial entities were not always able to respond to each item listed below. For a complete inventory of which State or territorial entity did or did not provide input to the items listed below see Chapter III, Section 2, Tabulated Results).

26. Participation

Pursuant to existing Federal laws and regulations under Section 10 and Section 404, plans for participation by the States and territorial entities analyzed has been reported as follows:

33 States have plans for review and comment on all applications;

39 States have plans for coordination with Federal government programs for permit processing; and

30 States have separate permit processing plans.

27. Section 404 State Administration

Of the 49 States and three territorial entities analyzed:

38 indicated their State or territorial entity generally supports delegation of the Section 404 authority to the State for administration; and

8 indicated their State or territorial entity generally does not support delegation of Section 404 authority to the State for Administration.

28. Section 10 State Administration

Of the 40 States and three territorial entities analyzed:

33 States generally support delegation of the Section 10 authority to the State for Administration; and

15 States generally do not support delegation of Section 10 authority to the State for Administration.

29. Seek Delegation (Section 404, Section 10)

Of the 40 States and three territorial entities analyzed:

34 indicated they would seek delegation of activities under Section 404 for their State or territorial entity;

9 respondents indicated they were "undecided" about seeking delegation of activities under Section 404 for their State or territorial entity

6 respondents indicated they would not seek delegation of activities under Section 10 for their State or territorial entity;

26 indicated they would seek delegation of activities under Section 10 for their State or territorial entity;

11 indicated they were "undecided" about seeking delegation of activities under Section 10 for their State or territorial entity; and

11 indicated they would not seek delegation of activities under Section 10 for their State or territorial entity.

30. Enacting Time

Of the 49 States and three territories analyzed:

32 indicated the average enacting time for their State or territorial entity to adopt any required authorizing legislation and/or funding legislation, and adopt rules, regulations, etc. necessary to assume delegation. This average is 17.5 months per State and ranges from 36 months in two States (South Dakota and Wyoming) to 6 months in several others (Colorado, Deleware, Montana, and Washington).

31. Local Authority

Thirty States indicated local (municipal and county) governments have authority in their State or territorial entity (independent from State agencies) to regulate activities similar or duplicative of those permitted under Section 404 or Section 10. Nineteen States indicated local (municipal and county) governments do not have authority in their State or territorial entity (independent from State agencies) to regulate activities similar or duplicative of those permitted under Section 404 or Section 10.

32. Local Authority Limitation

Of the 30 States indicating local units of government have authority in their State or territorial entity to regulate similar activities:

2 States indicated this authority limits State authority "at this time"; and

2 States believe that this local program authority may pose a "hinderance" to future delegation of the Section 404 or Section 10 programs in their State.

33. Manpower

Based on the estimates of the 49 States and three territorial entities analyzed, manpower (to cover policy and administration, technical and enforcement activities) for all of the programs of a particular State averaged 85.9 person per State. This ranged from only 2 persons in one State (Alabama) to 491 in another (Texas).

34. Expenditures

Based on the estimates of the 49 States and three territorial entities analyzed, expenditures for all of the programs of a particular State averaged $28,157,945.00 per State Fiscal Year 76. This ranges from $5,000.00 in Guam to $1,003,450,000.00 in another State (New York).

35. Permit Applications

Forty States indicated the number of permits applied for per year in their State or territorial entity (1976 estimated or 1975 actual). Based on the information obtained from these 40 states, a total of 56,142 permit applications were received. This represents an average of 1,403.5 permit applications per State, with a range of only 2 permit applications in one State (Deleware) to 15,900 permit applications in another (Oregon).

36. Permits By Fill

Twenty-one States indicated the number of permits granted by quantity of dredged or fill material discharged in their State or territorial entity. Based on the information obtained from these 21 States, 3,313 permits were granted (1976 estimated or 1975 actual) for less than 5,000 cubic yards of dredged or fill material. This averages 157.6 permits per State, with a range from no permits in several States (Minnesota, Oklahoma, Rhode Island and Guam) to 846 permits granted in another (Florida). A total of 1,016 permits were granted (1976 estimated or 1975 actual) for greater than 5,000 cubic yards of fill. This averages 48.3 permits per State, with a range from 1 permit in two States (New Hampshire and Guam) to 208 permits granted in another (Florida).

37. Permits by Purpose

Twenty-two States indicated the number of permits granted for small structures (piers and docks), for large structures (bulkheads), and for dredging activities in their State or territorial entity. Based on the information obtained from these 22 States, 4,214 permits were issued (1976 estimated or 1975 actual) for small structures. This averages 191.5 permits per State, with a range from no such permits issued in several States (Kansas, Minnesota, Oklahoma, Rhode Island and West Virginia) to 888 issued in another (Florida).

A total of 2,976 permits were issued (1976 estimated or 1975 actual) for large structures. This averages 141.7 permits issued per State, with a range from no such permits issued in several States (Florida, Kansas, Minnesota, New Hampshire, Oregon, Utah, and West Virginia) to 2,000 permits in another State (New York). A total of 3,047 permits were issued (1976 estimated or 1975 actual) for dredging activities. This averages 138.5 permits issued per State, with a range from no such permits issued in two States (Louisiana and New Hampshire to 1,150 permits issued in another (New York).

38. Permits by Waterbody Type

Thirty States indicated the number of permits issued for specific waterbody types in their State or territorial entity. Based on the information obtained from these 30 States 5,433 permits were issued (1976 estimated or 1975 actual) for rivers and streams. This averages 181.1 permits per State, with a range from no permits issued in three States (Montana, North Carolina, and Wisconsin) to 864 permits issued in another State (Michigan).

A total of 1,479 permits were issued (1976 estimated or 1975 actual) for marshes, swamps and bogs. This averages 49.3 such permits per State, with a range from no permits issued in numerous States (Alaska, Idaho, Indiana, Kansas, Minnesota etc.) to 1,080 in another (Massachusetts). A total of 3,472 permits were issued (1976 estimated or 1975 actual) for lakes and ponds. This averages 115.7 such permits per State, with a range from no permits issued in several States (Alaska, Minnesota, Nebraska, Nevada, etc.) to 945 in another State (Wisconsin).

39. Permits to Applicant Characteristics

Thirty-four States indicated the number of permits issued by applicant characteristics in their State or territorial entity. Based on the information obtained from these 34 States, 5,754 permits were issued (1976 estimated or 1975 actual) to residential applicants. This averages 169.2 permits per State, with a range from no permits issued in some States (Alabama, Deleware, Michigan, Montana, Oklahoma, etc.) to 1,350 permits issued in another (Florida).

A total of 20,570 permits were issued (1976 estimated or 1975 actual) to commercial and industrial applicants. This averages 606 permits per State, with a range from no such permits issued in one State (New Jersey) to 15,350 in another (Oregon). A total of 2,310 permits were issued (1976 estimated or 1975 actual) to agricultural applicants. This averages 67.9 permits per State, with a range from no such permits issued in several States (Alabama, Delaware, Florida, Lousiana, Michigan, New Hampshire etc.) to 700 permits issued in another (Colorado).

40. Additional Permit Information

Twenty-eight States indicated various requirements of permit information about their State or territorial entity. Based on the information obtained from these 28 States, 2,649 general permits were granted (1976 estimated or 1975 actual). This averages 94.6 permits granted per State with a range from no permits granted in some States (Colorado, Idaho, Iowa, Maryland, Massachusetts, etc.) to 571 permits granted in another State (Minnesota).

A total of 382 permit decisions were appealed (1976 estimated or 1975 actual). This averages 13.6 permit decision appealed per State, with a range from no permit decisions appealed in several States (Colorado, Connecticut, Maryland, Minnesota, Montana, Nebraska, etc.) to 215 in another (Massachusetts). A total of 1,500 permit violations were recorded (1976 estimated or 1975 actual). This averages 53.5 permit violations recorded per State, with a range from no permit violations recorded in some States (Massachusetts, Minnesota, Montana, Nebraska, New Jersey, etc.) to 403 permit violations recorded in another (Maryland).

41. Requirements Applied

Thirty-eight States indicated the number of requirements applied before the granting of permits in their State or territorial entity. Based on the data received from these 38 States, an average of 17.3 requirements per State are applied before the granting of permits. This ranges from one requirement in two States (Arizona and Deleware) to 64 requirements in another State (Texas).

42. Processing Steps

Forty-one States indicated the number of processing steps for the permit programs in their State or territorial entity. Based on the information received from these 41 States, an average of 10.3 processing steps per program was indicated. This ranges from 2.1 steps per program in one State (Mississippi) to 20 steps per program in another State (Virginia).

INTERSTATE CONFERENCE
ICWP
ON WATER PROBLEMS

TESTIMONY OF

THE INTERSTATE CONFERENCE OF WATER PROBLEMS (ICWP)

Presented by

A. KENNETH DUNN

DIRECTOR

IDAHO DEPARTMENT OF WATER RESOURCES

MEMBER, BOARD OF DIRECTORS, ICWP

Accompanied by

HENRY SILBERMANN

ASSISTANT SECRETARY

MARYLAND DEPARTMENT OF NATURAL RESOURCES

MEMBER, BOARD OF DIRECTORS, ICWP

Before

THE SUBCOMMITTEE ON ENVIRONMENTAL POLLUTION

COMMITTEE ON ENVIRONMENT AND PUBLIC WORKS

U.S. SENATE

WASHINGTON, D.C.

JULY 28, 1982

Senator Chafee, I appreciate the opportunity to appear before the Subcommittee on Environmental Pollution on behalf of the Interstate Conference of Water Problems (ICWP).

My name is Kenneth Dunn. I am the Director of the Idaho Department of Water Resources. I am here this morning not on behalf of the Department, but in my role as a member of the Board of Directors of ICWP. I am accompanied by Mr. Henry Silbermann who is the Assistant Secretary of the Maryland Department of Natural Resources and also a member of the ICWP Board of Directors.

Interstate Conference on Water Problems (ICWP)

For those on the Subcommittee who may not be familiar with ICWP, a little background may be helpful. The Interstate Conference on Water Problems (ICWP) is a national association on State, interstate, and intrastate water resource agencies concerned with water resources administration and related matters. ICWP was established in 1959 as an outgrowth of a regional conference on water problems as recognized in the same year by action of the General Assembly of the States.

ICWP, as an independent association of water agencies, works cooperatively with the National Governors' Association, the National Conference of State Legislatures, and the Council of State Governments, and serves as an advisory body to other associations of government officials in the area of water resources management, conservation, and development.

The purpose of ICWP is to facilitate cooperation, consultation, and exchange of information among State, intrastate, and interstate officials and agencies, as to the conservation, use, development, and administration of water and related land resources, and the laws governing these matters. For more than 20 years ICWP has been involved intimately in Federal-State relationships dealing with water and related resources. Its constant aim is to encourage intergovernmental cooperation, and to develop a consensus of State and intrastate views on any subject within the purview of ICWP, and to present and disseminate such views.

ICWP is managed by a Board of Directors elected annually, and reflecting national geographic distribution. Currently, Board members are from Idaho, Montana, Oklahoma, California, Ohio, Maryland, Pennsylvania, South Carolina, Kentucky, Mississippi, and Texas. The ICWP national office is located in Washington, D.C.

Court Decision

In the January 29, 1982 decision, National Wildlife Federation v. Gorsuch, the U.S. District Court (DC) held that certain dams may cause the "discharge of pollutants" as defined by the Clean Water Act. Water quality changes held to be "pollutants" included low dissolved oxygen, dissolved iron and maganese, temperature changes, and gas supersaturation.

After considering arguments, the Court decided that discharges over, through, or around dams are "point sources." The Court ordered that EPA ". . . designate dams as a point source category under Section 402 of the Clean Water Act, establish effluent limitations or other performance standards for dams on a categorical, as opposed to a case-by-case basis; and subject existing and proposed dams to all National Pollutant Discharge Elimination System [NPDES] requirements applicable to other categories of point sources . . ."

This decision is currently being appealed by the Environmental Protection Agency (EPA). If EPA is not successful, however, there are approximately 2,300,000 dams in the United States which would require permits under the Court's decision.

The ICWP is concerned that implementation of this decision could seriously interfere with existing State mechanisms to consider water quality impacts in the construction and operation of dams; destroy the balance which must exist among water resource uses including a consideration of water quality; and create an unduly burdensome and costly administrative procedure with little environmental benefit.

Because of the serious implications on the required work effort if the states and Federal agencies, including EPA, must deal with dams as point sources of pollution, the Interstate Conference on Water Problems urges Congress to act promptly.

ICWP recommends that Congress clarify in law -- that changes in water quality caused by the carriage, storage or release or water through dams, conveyance structures, and flow diversion facilities are not point sources of pollution which require national pollution control permits.

Existing State Mechanisms: Response to ICWP Questionnaire

At the outset, it should be noted that in the absence of the NPDES permit system or effluent guidelines promulgated by EPA, the water quality problems of dams can be and are addressed by programs operated under State law. In many States, the design, construction and operation of any existing or new dam must be reviewed for compliance with all State environmental law, including State water quality standards.

In some States, such as Colorado, the State water quality law prohibits requiring a pollution control permit for the carriage, storage, or release of water from or into streams, lakes, reservoirs, or conveyance structures in the exercise of water rights. However, the State law provides that water quality standards may apply to discharges from dams when the State Water Quality Control Commission has adopted appropriate control regulations. This assures that, without requiring pollution control permits, the State can act when justified to protect beneficial uses made of its water resources, to

address specific water quality problems associated with any particular dam.

Some data from a recent ICWP questionnaire to States and inter-and-intra State agencies will illustrate this point. Sixty-six percent of the 35 States responding indicated that their State has a program (other than NPDES) which regulates the construction and/or operation of dams, which includes authority to consider water quality impacts of such construction or operation.

A number of States cited State laws which specifically provide for the regulation of water quality impacts of dams. Two examples are California and Idaho. In California, the State has authority to regulate any discharge of waste that could affect water quality. In addition, the California Environmental Quality Act (CEQA) calls for consideration of all environmental impacts of a project at the time of approval. CEQA can be effectively used to mitigate nonwaste-related water quality impacts when water rights permits are being approved.

General authority is provided by the Idaho water quality standards to regulate all activities which lessen water quality. There is a specific dissolved oxygen standard for waters below dams. The Legislature has established monitoring requirements that are enforced by the Idaho

Department of Health and Welfare. The Idaho Department of Water Resources regulates dam construction, operation and maintenance (dam safety) and also administers water rights, by which water quality concerns are considered.

Mississippi, Montana, New Jersey, North Carolina, Oregon, to name a few, have some type of State statute requiring approval of the construction, alteration, or modification of dams which includes authority for the State to require modifications to adhere to water quality standards. For a listing of State responses to this and other questions, see the summary tables in Attachment A.

Fifty four percent of the States indicated that there are standards or guidelines for the protection of water quality which are applied in the review of permit applications for dam construction. Fifty seven percent reported such standards for dam or reservoir operation. The following standards were reported as being in place: Erosion and sediment control - 57%; Aeration devices or measures - 23%; Thermal release control - 40%; Conservation release/minimum flow requirements downstream to protect water quality - 57%; and, Water quality monitoring in 42% of the States responding.

A fuller sense of the extent to which States already take water quality impacts into account is reflected in responses to the question: "Are reviews of permit applications or project proposals for dams or reservoirs coordinated

with your State water quality activities?" Seventy-nine percent of the States responding said "Yes." Eighty-one percent of the States indicated that there is also coordination with State fish and game agencies; and sixty-six percent reported coordination with the U.S. Fish and Wildlife Service.

In States such as Kansas, Georgia, Michigan, Mississippi, Nevada, New Hampshire, New York, Oregon, Pennsylvania, Vermont, Washington, Wisconsin and Wyoming, agencies concerned with water and related land development and management routinely coordinate comments on proposals for reservoir construction. This coordination includes consideration of water quality impacts and related concerns. Wherever applicable, the concerns of fish and game interests are also considered.

Although fifty seven percent of the States reported that their State water quality program does not require water quality or discharge permits for dam construction, sixty-seven percent of the States indicated that, should an existing dam or reservoir contribute to or cause pollution, it is subject to regulation and corrective action.

For example, California reported that permits would be required if water quality would be affected; and Colorado reported if dewatering occurs during construction a permit will be required with restriction relative to pH, sediment, and oil and grease. In Arizona, the Water Quality Control Council has adopted surface water quality standards and stated

that, although the problem has never arisen, it is possible that a violation caused by operation of a reservoir could be prosecuted under those rules. It is interesting to note that two States, Georgia and New Mexico, indicated that the existing dams which create any water quality problem are large and federally owned. However, many States made it clear that currently no NPDES or NPDES-type permit is required for dam construction.

What Is A Dam?

What constitutes a "dam" for the purposes of regulation? There is a wide range of definitions in State law and practice as to what constitutes a dam. Thirty-two States responded to the question: "How does your State or jurisdiction define a "dam" which is subject to regulation? Twenty-three different answers were given. A few examples follow.

The Dam Safety Act in Louisiana defines a "dam" as any artificial barrier, including appurtenant works, which does or will impound or divert water or any other liquid substance and which (1) is or will be twenty-five feet or more in height from the bed of the watercourse measured at the downstream toe of the barrier or from the lowest elevation of the outside limit of the barrier, if it is not across a stream channel or watercourse, to the maximum water storage elevation or (2) has or will have an impounding capacity at maximum water storage elevation of fifty acre-feet or more. This definition

does not include any dam or barrier that is not or will not be in excess of six feet in height, regardless of storage capacity or which has or will have a storage capacity of maximum water storage elevation not in excess of fifteen acre-feet, regardless of height .

In Indiana, in general, dams are not considered to be subject to regulations if all the following conditions apply: The drainage area above the dam is not more than one square mile (640 acres); the height of the dam from the natural stream bed to spillway level is not more than twenty feet; and, the volume of water impounded does not exceed one hundred acre-feet.

In Idaho, dam means any artifical barrier together with appurtenant works, which is or will be 10 feet or more in height or has or will have an impounding capacity of maximum storage elevation of 50 acre-feet or more. Height of a dam is defined as to the vertical distance from the natural bed of the stream or watercourse at the downstream toe of the barrier, as determined by the Director, or from the lowest elevation of the outside limit of the barrier, if it is not across a stream channel or watercourse, to the maximum water storage elevation. No obstruction in a canal used to raise or lower water therein or divert water therefrom and no fill or structure determined by the Director to be designed

primarily for highway or railroad traffic shall be considered a dam.

Some States, like Iowa, reported that a combination of height and storage standards is used to define. Another example of this is the definition used in New York, where a dam must generally control a drainage area greater than one square mile, or have a height of 10 feet, or impound more than one million gallons of water to be subject to state regulation. In Pennsylvania, any dam which is 15 feet or more in height, has a storage capacity of 50 acre feet, or has a drainage area exceeding 100 acres is subject to state regulation. In Vermont, a structure capable of impounding more than 5,000 cubic feet of water is subject to regulation.

In New Jersey, under the "Safe Dam Act" a dam is defined as any structure which will raise the water of any river or stream more than five (5) feet above the usual mean low water height. Structures of less than this height, if located on natural streams (or rivers) are also regulated pursuant to the Flood Hazard Area Control Act.

In Nevada, any dam 10 feet or greater or storing more than 10 acre feet, must have a permit from the Division of Water Resources. Any dam which is subject to city or county

construction permits is required to use Best Management Practices.

In Nebraska, absent a statutory definition, the department considers dams to be of two types: dams constructed for the purpose of (1) holding back and raising water for service to lands of a higher elevation, or (2) to create greater head for hydroelectric generation. Generally a dam is a constructed barrier designed for either purpose.

The bottom line is definitions of the term "dam" among states vary widely for the purpose of determining the need for regulation. Imposition of a single uniform definition will have significant consequences, and could result in unnecessary disruption of existing State regulatory activities and duplicative administrative practices which may produce no significant water quality improvements.

Need to Integrate Water Resources and Water Quality Considerations

The U.S. District Court ordered that control of dams be approached through categorical effluent standard and NPDES permits. If established water quality standards are, in fact, appropriate and achievable goals, they ought to be met. However, it is not unreasonable to consider some alteration of standards to achieve a reasonable balance between water uses. For example, cold water discharge, and introduced cold water fishery, has been acceptable in instances and actually preferred

to restoration of a warm water regime and associate fishery. In other instances, a release may not be in compliance, or fully in compliance, with water quality standards for the receiving stream, but the persistence of the condition may be short-lived, and therefore acceptable. Another example: low dissolved oxygen and altered temperature may recover to ambient conditions within a time period and reach of the stream and be compatible with the downstream water use.

As is well known, many of the remedies for water quality problems are costly, but cost alone should not and must not deter needed correction where significant environmental improvement can be achieved or anticipated. Yet, should there be a mandate for the imposition of management practices regardless of cost, where the environmental benefits are likely to be small and insignificant, when compared to other environmental protection efforts? We think not.

When judged in this light, ICWP finds that the categorizing of dams as point sources of pollution, subject the NPDES permitting, would add a heavy administrative and economic burden without ensuring significant water quality benefits. There is no doubt that huge expenditures of money would be required for surveys and studies, the NPDES permitting process, the requirements imposed for retrofitting, the requirements imposed for operation and maintenance, the need to report NPDES compliance and non-compliance, the administrative need

for monitoring, etc., etc., and all this-in many, many instances-without achieving real improvements in water quality.

Instead, if dams are evaluated on a case-by-case or site-specific basis, and subjected to water quality management control when it is determined that water pollution results from a project, necessary water quality protection can be achieved where needed and feasible.

New Dams And Reservoirs

Water quality protection must be considered in the planning, design, and construction of new dams and reservoirs. ICWP supports for such new projects, the use of available technology, the providing of baffles and current deflectors where appropriate, destratification techniques for smaller reservoirs, the use of floating pumping stations in certain projects, outlet structures which permit withdrawal of releases from different depths or zones, and other featurs which will make the structure a source of environmental protection and enhancement, and not a source of water pollution. Such evaluation, however, is and should be the responsibility of the individual States.

Shifting the withdrawal to a different zone is a potential solution to many of the water quality problems in release waters. The remedy to cold water discharges is to shift withdrawal to the surface waters (epilimnion) or to mix discharges to achieve a desirable temperature. While existing dams may require major reconstruction of outlet works or installation of skimming weirs to achieve this, the problem could be handled

readily in new projects. For existing dams, spillway crest gates can be operated in lieu of outlet works in some cases, but a skimming weir may be the only solution for deep turbine intakes, and it may not be successful.

Clean Water Act Strategies

The Clean Water Act provides two strategies which are applicable to this issue: 1) point source control via Section 402 or 2) nonpoint source control via Section 208. EPA prefers nonpoint source control and has prepared amendments to the Clean Water Act to accomplish this.

Point source control for dams triggers a series of predetermined and rather inflexible events: 1) categorizing dams for control, 2) establishing effluent guidelines or performance standards, 3) processing NPDES permits, and 4) enforcing permits.

In specific cases, the discharge of waters from dams can produce severe localized impacts. These can best be dealt with on a case-by-case basis. There is a real benefit in the use of our limited staff and financial resources, if we focus on the problems which are known, readily identifiable, and must be corrected.

The issuance of a permit to discharge within prescribed limits generally assumes some control over the character of the discharge itself. In the vast majority of existing dams, no such control exists at the dam site. Therefore,

the only techniques available to effect a change in the discharge are to construct at great-and possibly prohibitive-costs requisite water quality control structures, or to apply management practices to the watershed. Either alternative becomes an extreme administrative burden if it is required that all dams must be subject to NPDES permitting. (There are appoximately 2,300,000 dams in the United States which would require permits under the Court's decision). The proposed amendments by EPA would provide a feasible solution.

Dams As Non-Point Sources

EPA' long-standing interpretation that dams are non-point sources subject to State best management practices allows for responsible State integration of its water resource and water quality management programs. EPA uniform national effluent standards for dams would limit the flexibility of the States to address their own water resource concerns and to balance them against water quality issues.

It should be noted that there are two technologies that when applied to larger dams are beneficial in maintaining quality. One is the pump storage concept which recirculates and changes the relative position of each particulate every 24 hours for the most part. The second is the adequate use of rip rap below the dam discharge point, which if supplied in sufficient quantity, can help reestablish oxygen levels at least cost over time.

The major concern, though, is that by requiring the Environmental Protection Agency to establish effluent limitations and to issue NPDES permits for dams, the issue of water quality per se will become paramount, distorting the very purposes for which the dams were initially constructed, and obstructing the balancing procedures required by the National Environmental Policy Act.

Water quality and other environmental concerns are of great importance. However, reservoirs are constructed and built for other purposes such as flood control, navigation, water supply, and hydropower.

The goal should be a balanced approach to water management recognizing water quality as one of several important considerations. Water control plans must be carefully developed and implemented considering all beneficial project purposes. This process necessarily involves compromise and considerable coordination among water users to obtain the greatest public benefit from each project. Directing EPA, with the single objective of environmental improvement, to establish a permitting program for reservoir regulation could lead to distortion of other equally important water resource objectives.

Some water quality problems can be created or avoided by design elements of the dam, particularly related to spillway and outlet structures. These elements vary greatly according to the type, size, and site of the dam.

Overall the water quality problems posed by dams in large part depend on where the dam is located, upstream sources of pollution that may be concentrated in the dam, the purpose of the reservoir, its depth and volume, structural features, and its operating program. For this reason, it is extremely difficult to categorize the design, operation, or impact of a proposed reservoir, and hence to prescribe effluent guidelines or design standards that are meaningful for a particular category of facility.

Administrative Cost vs Environmental Benefit

Eight-three percent of the States responding to the question "Does your State or jurisdiction feel the dams, waters stored in reservoirs or water released from reservoirs should be subject to the NPDES permit process?" said "No"

Both Arizona and California pointed out that the State had not taken an official position at the time of the questionnaire, but that such permitting is low priority; limited resources are needed elsewhere; and, there is adequate authority to address most water quality issues under State law. Similar statements regarding adequacy of State law, the good working mechanism of the Section 401 process, and the poor cost-effectiveness of NPDES permits were made by States such as Maine, Mississippi, New Jersey, Oklahoma, North Carolina, Vermont, and Wisconsin.

The requirement of permits under NPDES would impose substantial administrative and other cost-related expenditures

on the operation of dams and reservoirs. At the least, NPDES permit limitations on the release of impounded water could interfere with the ~~dauration~~ diversion of water rights and the counteraction of the purposes for which the reservoirs were intended. For example, Colorado reported that because of water rights consideration, agencies within the Department of Natural Resources exercise primary control over releases from dams and reservoirs. State law specifically states that water releases in the exercise of water rights shall not be considered point sources. To issue permits to the approximately two million dams in the U.S., or even to any significant fraction of this number, would have profound implications for the total NPDES program nationally, and for the ability of EPA and the States to adequately regulate major dischargers to toxic pollutants. To issue permits for fifty thousand or sixty thousand of the largest dams or even for a significant portion of that number would substantially impair the ability of States to adequately regulate major discharges of priority pollutants.

The process of permit issuance for dams would constitute a crippling new workload burden for EPA and the States. EPA and the States, wherever possible, issue permits based on promulgated effluent limitations guidelines. EPA may not be able to issue such guidelines for dams in the near future. Even assuming guidelines are available to permit-issuing authorities, the workload will be enormous. EPA and the State would receive, and evaluate for completeness, applica-

tions for between fifty thousand and two million dams. Each dam would then be assigned effluent limitations based on the applicable guidelines. The permit-issuing authority would then evaluate those limits to see if they would provide for the attainment of water quality standards. If not, more stringent limits would have to be developed on a case-by-case basis. After this technical analysis, EPA or the State would begin the process for issuance of the permit.

These estimates do not take into account the resources necessary to conduct the water quality surveys to determine whether each dam requires a permit. Neither do they take into account the time needed for evidentiary hearings. Owners and operators of dams (particularly in the West, where water rights have fundamental importance) may strongly resist any regulatory efforts perceived as affecting dam operations, and thus affecting downstream water flow. These owners and operators would thus be likely to request evidentiary hearings more frequently than normal. Evidentiary hearings can add one work-year to each permit challenged. EPA and the States are simply unequipped to assume such an immense burden.

One of the remedies suggested by the District Court decision was the use of area-wide or general permits which would cover many of these dam facilities. There are at least two potential problems which would hinder the issuance of general permits.

First, in order to issue a general permit, all of the potential permittees to be covered by a general permit must be similar in nature with similar pollutant discharges. Since the dam-created problems will vary for each dam site, general permits would be very difficult to apply. Before a general permit can be considered it will be necessary to identify all the various dam-created problems that could occur, and the potential solutions for these problems. Frequently these solutions would require case-by-case determinations of necessary changes in operation of the dam, such as water release at different water levels from the dams to control temperature and dissolved oxygen content or use of spillway deflectors to avoid supersaturation. Since the problems attributtable to the dam or the reservoir, as well as the solutions, would vary depending upon on the dam site, a general permit containing conditions and requirements for all dams to be covered by the general permit might well not be feasible.

An additional administrative problem which exists for the use of general permits is that none of the thirty three approved NPDES States has yet been approved to issue general NPDES permits. Many of these States may need to modify their State regulations and EPA-State agreements to authorize the State to issue general permits. General permits cannot be issued in approved States until these States make the

appropriate modifications and are then authorized to issue general permits.

The process of gathering and evaluating data on dams would be more complex and difficult than developing typical industrial effluent guidelines. Dams have to be examined in terms of traditional effluent limitations factors such as age, size, type or facility, and the other factors listed above. In addition, such factors as location, climate, mode of operation (flood control, power generation etc.), hydrodynamics of impounded water, biological activity in the reservoir and surrounding stream use need to be considered not only in determining control measures but even in deciding whether the dam or reservoir causes "pollution" and is therefore subject to regulation under the Court's order. For example, the appearance of low dissolved oxygen conditions depends significantly on the presence of oxygen-demanding substances in the reservoir. The size and type of dam does not determine what the loadings of oxygen-demanding substances will be in the reservoir. The land use patterns upstream from the dam and the biological activity in those upstream water are among the critical factors determining such loadings.

Moreover, dams play a crucial role in allocation of water rights under State law, particularly in Western states, and in maintenance of stream flow (including water quality enhancement) through controlled releases. Any effluent

limitation guideline would have to be developed with exceeding care to take into account these complex factors.

It is not clear that it will be possible to develop category-wide effluent limitations or standards for dams. There is some evidence that the environmental problems which are caused by dams are so site-specific that uniform national requirements cannot be developed. If a dam causes environmental problems at one location, structurally similar dams may pose either no problem or markedly different problems in different locations. Further technology to solve a problem in one dam may not work for another dam with similar problems. This disparity among structurally similar dams means that it will be difficult, perhaps impossible, for EPA to identify subcategories subject to uniform limits. This technique is the only means by which the Agency can establish effluent limits for categories of diverse sources. If it is unavailable, effluent limitations guidelines cannot be developed.

Even assuming it is possible to develop effluent limitations guidelines for dams, developing uniform national effluent limitations where there are frequently overriding site specific problems has never been attempted before in the Effluent Guidelines Program.

The judgment gives very little consideration to the practical problems and relative benefits of permitting effort. Available information and experience indicates that the controllable adverse water quality impacts from the operation of existing

dams are extremely small compared with other tpes of impacts, particularly those from the discharge of municipal and industrial wastewaters. Therefore, the significant amount of resources which would be required for permitting dams would be diverted from the already limited resources devoted to the existing permit programs for municipal and industrial wastewater dischargers. If implemented, the net result of this judgment could be that resources would be diverted from areas of high productivity of environmental benefits to areas of low environmental benefits.

Water quality effects from the construction of new dams are already adequately evaluated and regulated under existing environmental programs, such as the Section 401 certification program and Section 404 "Dredge and Fill" permit program administered by the Corps of Engineers.

The section 401 certification process is used to consider and integrate water quality impacts in regard to water resource issues. Also, in evaluating this process, States indicated that water quality standards are used as a basis for regulation and that corrective action can be compelled where the standards are or would be violated.

In addition to specific State authorities, a number of States reported that they have an active section 401 certification program under the authority of Clean Water Act, which deals with all major dams. For example, in Colorado,

the coordination occurs through the section 404 permit process, the section 401 certification reviews, and the Environmental Impact Statement reviews. This is also done in Louisiana, Massachusetts, Idaho, Montana, Maine, North Carolina, Oklahoma, Oregon, South Dakota, Virginia, and Washington.

Section 401 allows for the balancing of water resources uses and water quality impacts unlike section 402 which would require a preeminence of water quality concerns, potentially resulting in a significant distortion of the initial water resources purposes.

Conclusion

Based on the above considerations, in ICWP's view, the regulatory approach called for by the National Wildlife Federation v. Gorsuch decision is neither the most effective nor the most efficient method of addressing water quality problems related to reservoirs. A more appropriate vehicle, utilizing State dam permitting coupled with state best management practices and technical assistance program, should be endorsed by Congress.

This, Mr. Chairman, concludes my statement on behalf of the Interstate Conference on Water Problems. Mr. Silbermann and I will be pleased to attempt to respond to any questions you or the Members of the Subcommittee may have.

20-955 O—84——145

Mr. ROE. Now, let's take the Izaak Walton League, Ms. Bloch and Mr. Weiss.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

THE IZAAK WALTON LEAGUE OF AMERICA
INCORPORATED

TESTIMONY OF ETHYLE BLOCH,

PRESIDENT, INDIANA DIVISION,

IZAAK WALTON LEAGUE OF AMERICA

BEFORE THE

SUBCOMMITTEE ON WATER RESOURCES

SUBCOMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

ON THE CLEAN WATER ACT

NOVEMBER 9, 1983

I AM ETHYLE R. BLOCH, PRESIDENT OF THE INDIANA DIVISION OF THE IZAAK WALTON LEAGUE OF AMERICA. I LIVE IN FORT WAYNE, INDIANA, AN OFFICIAL 1983 "ALL AMERICAN CITY" THAT SUFFERED A DRASTIC FLOOD IN 1982. I HAVE LIVED THERE FOR OVER 35 YEARS, AND I HAVE BEEN INTERESTED IN AND PARTICIPATED IN CLEAN WATER ISSUES SINCE THE 1960'S. AS A MEMBER OF THE IZAAK WALTON LEAGUE AND THE LEAGUE OF WOMEN VOTERS, I FOCUSED ON POLLUTION PROBLEMS IN THE MAUMEE RIVER BASIN.

THE CLEAN WATER ACT IS A VITAL, NECESSARY LAW TO CLEAN UP OUR NATION'S POLLUTED STREAMS. IT PLACES THE FEDERAL GOVERNMENT IN THE DRIVER'S SEAT TO RESTORE AND MAINTAIN THE CHEMICAL, PHYSICAL AND BIOLOGICAL INTEGRITY OF THE NATION'S WATERS BY ESTABLISHING A NATIONWIDE CLEAN WATER PROGRAM. FEDERAL AUTHORITY PROVIDES THE STATE AND LOCAL GOVERNMENTS WITH THE PUSH NEEDED TO RUN GOOD PROGRAMS. THE CLEAN WATER ACT ESTABLISHED 1983 AS THE YEAR TO MEET THE FISHABLE, SWIMMABLE GOAL. AFTER A LOT OF HARD WORK, WE HAVE PARTIALLY SUCCEEDED IN MEETING THIS GOAL AND RESTORING OUR WATERS BY REMOVING FROM THEM MUCH OF THE SOAP SUDS, DEAD ANIMALS AND FEED LOT WASTES, GREASES, OILS, GARBAGE, ETC. -- THE POLLUTION WE CAN SEE.

THE REMAINDER OF THE TASK IS THE TOUGHEST NUT TO CRACK. WE HAVE JUST BEGUN TO CONTROL THE WATER CONTAMINANTS THAT WE CAN NOT SEE -- THOSE TOXIC CHEMICALS THAT TOO OFTEN ARE DISCHARGED INTO OUR STREAMS FROM INDUSTRIAL PIPES, MUNICIPAL TREATMENT PLANTS, AND RUNOFF FROM FARMS, CITY STREETS, AND CONSTRUCTION SITES. CANCER

OR BIRTH DEFECT-CAUSING CHEMICALS LIKE CADMIUM, LEAD, PCB'S OR MERCURY COME FROM ALL OF THESE SOURCES. THESE TOXICS NEVER DISAPPEAR; THEY CAN MINGLE TO FORM EVEN MORE HAZARDOUS CONTAMINANTS; OR THEY CAN SETTLE INTO AND REMAIN IN THE WATER, BOTTOM SEDIMENTS, OR SLUDGE. SCIENTISTS TEDIOUSLY STUDY THESE CHEMICALS AND ARE DISCOVERING THEIR EVIL EFFECTS ON FISH, WILDLIFE AND HUMANS.

IN 1983, CONGRESS FACES A FUNDAMENTAL QUESTION. DO YOU REAUTHORIZE AND STRENGTHEN THIS VITAL CLEAN WATER ACT? OR DO YOU --- IN EFFECT --- RELAX CONTROLS BY BUDGET CUTTING AND BY PUSHING THIS TASK ONTO STATE AND LOCAL GOVERNMENTS? THE WATER QUALITY RENEWAL ACT, H.R. 3282, SPONSORED BY REPRESENTATIVE JAMES HOWARD, REAFFIRMS THE GOALS OF THE ACT ESTABLISHED BY CONGRESS IN 1972. THE INDIANA DIVISION OF THE IZAAK WALTON LEAGUE OF AMERICA URGES THIS COMMITTEE TO PASS H.R. 3282, RATHER THAN UNDO PAST ACHIEVEMENTS OF ELIMINATING VISIBLE POLLUTANTS AND IGNORING THE TASK OF COMBATTING THE INVISIBLE ONES, AS SOME OPPONENTS OF CLEAN WATER WOULD LIKE.

TO ILLUSTRATE OUR CONCERNS, I WOULD LIKE TO DISCUSS POLLUTION PROBLEMS IN FORT WAYNE AND INDIANA. THESE PROBLEMS OCCUR ELSEWHERE IN THE UNITED STATES AS WELL.

NPDES PERMITS HAVE BEEN ISSUED BY THE STATE TO ABOUT 10 OF THE OVER 80 INDUSTRIES WITHIN THE URBAN AREA OF MY COUNTY. HOWEVER, THE SEWAGE TREATMENT PLANT RECEIVES EFFLUENT DISHCARGED

FROM ABOUT 70 INDUSTRIES. THESE FIGURES ARE ESTIMATES BECAUSE THE FORT WAYNE MUNICIPAL GOVERNMENT REFUSES TO PROVIDE BONA FIDE STATISTICS AND FACTS TO THE PUBLIC.

THE PRINCPLE INDUSTRIES IN MY COMMUNITY ARE STEEL AND MAGNET WIRE MANUFACTURING, ELECTRO-PLATING AUTOPARTS, AND SMALL MOTORS AND TRAILER MANUFACTURING. THESE INDUSTRIES DISCHARGE HEAVY METALS AND ORGANIC TOXICS INTO THE FORT WAYNE PUBLICLY OWNED TREATMENT WORKS (POTW) WHICH END UP IN THE 7,000 TONS OF SEWAGE SLUDGE GENERATED ANNUALLY AT THE PLANT. THE SLUDGE IS PLACED IN A ONE SQUARE MILE AREA OF LAGOONS SITUATED IN THE MAUMEE RIVER FLOOD PLAIN, WHERE IT STAYS FOR ABOUT 4 YEARS. EVERY TIME FORT WAYNE SUFFERS A BIG FLOOD, THE LAGOONS ARE INUNDATED WITH WATER. THE TOXIC-LADEN SLUDGE WASHES INTO THE MAUMEE RIVER, CONTAMINATING THE WATER SUPPLY DOWNSTREAM, WHICH FLOWS INTO THE WESTERN END OF LAKE ERIE. IN 1982, AS PRESIDENT REAGAN WAS LOADING SANDBAGS IN FORT WAYNE TO SAVE THE PEOPLE LIVING BEHIND THE PEMBERTON DIKE, THE POISONS FROM THE SLUDGE FLOWED INTO, ON AND AROUND THEM DOWNSTREAM. AFTER FOUR YEARS, MOST OF THE SLUDGE IS GIVEN TO CITIZENS FOR LAND APPLICATION WITH ONLY A LITTLE YELLOW CARD (SEE ATTACHMENT #1.) TO INFORM THEM OF ITS CHEMICAL CONTENT. THE CARD ONLY INFORMS THE READER OF THE RESTRICTIONS ON APPLICATIONS OF THIS SLUDGE. HOWEVER, THIS IS JUST A WARNING, NOT A REQUIREMENT.

FORT WAYNE HAS RECEIVED OVER $86 MILLION IN FEDERAL FUNDS SINCE 1972 TO EXPAND ITS SEWAGE PLANT, YET THE CITY DOES NOT REQUIRE ITS INDUSTRIAL CUSTOMERS TO PRETREAT THEIR TOXIC

DISCHARGES INTO THE PLANT. EFFLUENT ENTERING THE PLANT IS MONITORED FOR FLOW AND A SURCHARGE IS PAID ON EXCESS BIOLOGICAL OXYGEN DEMAND (BOD), CHEMICAL OXYGEN DEMAND (COD), SUSPENDED SOLIDS AND PHOSPHORUS. THE POTW SUPERINTENDENT DECIDES ON AN INDIVIDUAL CONTRACT BASIS WHETHER TO REQUIRE THE REMOVAL OF TOXICS FROM INDUSTRIAL EFFLUENT DISCHARGED INTO THE PLANT. ACCORDING TO THE CURRENT SUPERINTENDENT, THE ONLY RESTRICTION ON ACCEPTING THESE WASTES IS TO PREVENT A "SLUG" OF TOXICS FROM KNOCKING OUT THE MICRO-ORGANISMS IN THE POTW'S BIOLOGICAL TREATMENT SYSTEM. HOW OFTEN THESE SLUGS OCCUR REMAINS A SECRET. FORT WAYNE DOES NOT REVIEW OR MONITOR THE PASS-THROUGH OF METALS OR ORGANICS THROUGH THE POTW AND INTO THE MAUMEE RIVER. THERE IS ALSO LITTLE CONCERN ABOUT THE CONCENTRATION OF TOXICS IN THE POTW'S SLUDGE. THE POTW SUPERINTENDENT ADJUSTS THE RATE OF LAND APPLICATION OF SLUDGE, WHICH IS BASED ON A TONS PER ACRE RATE, AS REQUIRED BY STATE GUIDELINES. ALTHOUGH THE CITY WAS VAGUE ABOUT TESTS CONDUCTED ON THE TREATED EFFLUENT, IT SEEMS THAT ONLY RIVER TESTS ARE DONE, THERE ARE NO EFFLUENT TESTS. THESE THRICE WEEKLY RIVER TESTS PROVIDE ALMOST NO INFORMAITON ABOUT THE PASS-THROUGH OF TOXICS THROUGH THE SEWAGE TREATMENT PLANT.

IN ADDITION, THE CITY'S NPDES PERMIT FOR ITS POTW HAS PARAMETERS ONLY FOR BOD, SUSPENDED SOLIDS, PHOSPHOROUS, AND PH. OVERALL, THERE ARE NO CHECKPOINTS TO MEASURE THE SUCCESS OR FAILURE OF INDUSTRIAL PRETREATMENT EFFORTS. INDIANA DOES NOT REQUIRE ADEQUATE MONITORING OF PRETREATMENT PROGRAMS.

THE FORT WAYNE SEWAGE PLANT IS BLYTHELY GLIDING ALONG. BECAUSE THERE ARE NO NATIONAL PRETREATMENT REQUIREMENTS IN PLACE, DECISION MAKING, REGULATIONS, AND ENFORCEMENT ARE BASED STRICTLY ON WHAT THE TRAFFIC WILL BEAR. PRETREATMENT DECISIONS ARE MADE BASED ON WHAT NEW INDUSTRIES CAN BE LURED BY THE CHAMBER OF COMMERCE AND THE MAYOR'S ECONOMIC DEVELOPMENT COMMISSION, COMPLAINTS BY OLD INDUSTRIAL CUSTOMERS WHO STUBBORNLY REFUSE TO CHANGE THEIR WAYS, AND THE DESIRE TO KEEP THE STATUS QUO WITH THE SIMPLE REQUIREMENTS OF THEIR DISCHARGE PERMIT.

INDUSTRIES WILL FIND IT VERY COST EFFECTIVE TO BE A MUNICPAL CUSTOMER IF NATIONAL CATEGORICAL AND GENERAL PRETREATMENT STANDARDS ARE UNDERCUT BY A "WAIVER" OR OPT-OUT FOR SOME CITIES; IT IS LOGICAL THAT INDUSTRIES WILL GO "POLLUTION SHOPPING". IT IS HAPPENING. JUST WITHIN THE LAST YEAR, FORT WAYNE'S UTILITY CONSULTANT URGED THE CITY COUNCIL TO PASS AMENDMENTS TO THE SEWAGE ORDINANCE TO INCREASE THE CONCENTRATION LIMITS IN THE DISCHARGE OF 8 HEAVY METALS INTO THE SEWAGE PLANT TO ATTRACT INDUSTRY TO FORT WAYNE. THESE CHEMICALS ARE CADMIUM, CYANIDE, TOTAL CHROMIUM, COPPER, LEAD, MANGANESE, PHENOL AND SILVER. THIS CHANGE WAS DESIGNED TO BENEFIT INDUSTRY BY REDUCING TREATMENT COSTS BY ABOUT $45,000 ANNUALLY. ANOTHER REASON FOR THE CHANGES WAS THAT EPA WAS EXPECTED TO RELAX STANDARDS ANYWAY.

INDIANA'S PRETREATMENT REGULATIONS, REQUIRED BY MAY, 1982, ARE NOT YET IN EFFECT. CATEGORICAL STANDARDS ARE NOT ENFORCED BECAUSE EPA IS JUST NOW ISSUING THE STANDARDS. IN FORT WAYNE,

INDIANA, ECONOMICS, AND NOT ENVIRONMENTAL PROTECTION, IS THE DECIDING FACTOR IN PRETREATMENT STANDARDS AND PROGRAMS.

INDIANA'S PRETREATMENT REGULATIONS ALLOW VARIANCES IF AN INDUSTRY CLAIMS A DIFFERENT DISCHARGE FACTOR THAN ITS NATIONAL CATAGORICAL STANDARD. ALSO, POTW PRETREATMENT REGULATIONS CONTAIN EXEMPTIONS FOR SMALL COMMUNITIES FROM ESTABLISHING A PRETREATMENT PROGRAM. THIS IS A LOOPHOLE FOR SMALLER COMMUNITIES OF LESS THAN 5 MGD HYDRAULIC CAPACITY.

AFTER LISTENING TO THIS LONG LIST OF PROBELMS WITH FORT WAYNE'S PRETREATMENT AND SEWAGE TREATMENT SYSTEMS, ONE COULD ARGUE THAT A COMMUNITY LIKE FORT WAYNE WOULD BE UNLIKELY TO RECEIVE A WAIVER FROM THE NATIONAL PRETREATMENT PROGRAM, AND BE ALLOWED TO OPERATE ITS OWN PROGRAM. OUR CONCERN IS THAT FORT WAYNE COULD, IN ANY EVENT, APPLY FOR AN OPT-OUT, THEREBY TRIGGERING DELAYS IN THE IMPLEMENTATION OF THE NATIONAL CATEGORICAL PRETREATMENT STANDARDS FOR ITS INDIRECT DISHCARGERS. AS THIS SUBCOMMITTEE KNOWS, WHEN CONGRESS CREATED OTHER WAIVER PROGRAMS IN THE CLEAN WATER ACT -- LIKE THE 301 (H) PROGRAM FOR THE DISCHARGE OF UNTREATED SEWAGE INTO THE OCEAN -- MANY COMMUNITIES THAT WERE NOT "SUPPOSED TO" RECEIVE WAIVERS APPLIED ANYWAY.

THIS HAS LED TO A BACK LOG OF APPLICATIONS AT EPA, AND LENGTHY DELAYS IN MEETING THE REQUIREMENTS OF THE ACT BY APPLICANTS. IN ADDITION, EVEN IF FORT WAYNE IS DENIED A PRETREATMENT WAIVER, THE IMPLEMENTATION OF NATIONAL PRETREATMENT

STANDARDS COULD STILL BE DELAYED FOR YEARS IF THE CITY CHALLENGES THAT DECISION IN COURT. AND, GIVEN FORT WAYNE'S RELUCTANCE TO RUN A SOUND PROGRAM NOW, THIS IS A LIKELY POSSIBILITY. A PRETREATMENT OPT-OUT PROGRAM WOULD MEAN YEARS OF DELAY IN REDUCING THE THOUSANDS OF POUNDS OF TOXICS DISHCARGED ANNUALLY INTO OUR SEWAGE TREATMENT SYSTEM. MANY OF THESE TOXICS WILL EVENTUALLY CONTAMINATE THE MAUMEE RIVER EITHER BY PASSING THROUGH THE PLANT UNTREATED, OR BY LEACHING OUT OF THE CONTAMINATED MUNICIPAL SLUDGE DURING THE NEXT BIG FLOOD.

A PRETREATMENT OPT-OUT PROGRAM -- NO MATTER HOW TOUGH -- HAS INHERENT PITFALLS FOR THE CONTROL OF TOXICS IN INDIANA. MUNICIPAL SEWAGE TREATMENT PLANTS IN HAMMOND, EAST CHICAGO, MICHIGAN CITY, AND GARY HAVE ALL SUFFERED FROM SERIOUS PROBLEMS, AND HAVE VIOLATED THEIR DISHCARGE PERMITS FOR CONVENTIONAL POLLUTANTS. THE STATE HAS ALMOST NO NUMERICAL CRITERIA FOR TOXICS, WHICH ARE ESSENTIAL TO DETERMINE WHETHER THE DISCHARGES FROM POTW'S RUNNING THEIR OWN PRETREATMENT PROGRAM ARE HARMING WATER QUALITY. THE INDIANA WATER POLLUTION CONTROL DIVISION IS VERY UNDERSTAFFED, UNDERPAID AND OVERWORKED. A PRETREATMENT OPT-OUT WOULD STRAIN THESE ALREADY TIGHT RESOURCES EVEN FURTHER, AND WOULD TAKE STAFF PEOPLE AWAY FROM MONITORING AND ENFORCEMENT OF INDUSTRIAL POLLUTERS. EVEN NOW, INDIANA DOES LITTLE ON-SITE SAMPLING FOR WATER QUALITY, AND PRACTICALLY NO SAMPLING FOR TOXICS.

MY FELLOW HOOSIER, WILLIAM RUCKELSHAUS, NOTED WHEN HE TESTIFIED ON CLEAN WATER IN THE SENATE THIS YEAR THAT "ANY

(PRETREATMENT) WAIVER SYSTEM THAT WE WERE TO COME UP WITH ... WOULD BE RESOURCE INTENSIVE....IT WOULD CAUSE MORE RESOURCES TO BE DEVOTED TO IT AT THE STATE LEVEL AS WELL." SO, ALTHOUGH THERE MAY BE COMMUNITIES IN INDIANA THAT OPERATE BETTER SEWAGE TREATMENT PROGRAMS THAN FORT WAYNE, ALLOWING SUCH COMMUNITIES TO OPT- OUT OF THE NATIONAL PRETREATMENT PROGRAM WOULD ULTIMATELY HARM INDIANA'S ENVIRONMENT. A BETTER USE OF EPA AND INDIANA'S LIMITED RESOURCES IS TO ISSUE THE REMAINDER OF THE NATIONAL CATEGORICAL PRETREATMENT STANDARDS, AND THEN VIGOROUSLY ENFORCE THEM.

TOXIC HOT SPOTS: WE'VE GOT A BAD ONE

H.R. 3282 WOULD ALSO REQUIRE EPA TO IDENTIFY WATERS THAT WILL BE HEAVILY POLLUTED WITH TOXICS EVEN AFTER ALL OF THE ACT'S EXISTING CONTROLS ARE IN PLACE. ONCE EPA HAS IDENTIFIED THESE "TOXIC HOT SPOTS", IT MUST DEVELOP AND ENFORCE ADDITIONAL CONTROLS ON THE DISCHARGE OF THE PROBLEM TOXICS NEEDED TO ACHIEVE WATER CLEAN ENOUGH FOR FISHING AND SWIMMING.

WE CAN SAVE EPA THE TROUBLE OF COMING TO INDIANA TO IDENTIFY HOT SPOTS--WE ALREADY KNOW WHERE OURS ARE. THE GRAND CALUMET RIVER IS ONE OF THE MOST POLLUTED BODIES OF WATER IN THE STATE. STEEL PLANTS AND OTHER INDUSTRIES DISCHARGE LARGE AMOUNTS OF CYANIDE, LEAD AND AT LEAST FIVE OTHER HEAVY METALS INTO THE RIVER, WHICH FLOWS DIRECTLY INTO LAKE MICHIGAN. TOXICS FROM THE GRAND CALUMET RIVER HAVE POISONED FISH, MAKING MANY IMPORTANT SPECIES SUCH AS TROUT UNFIT FOR HUMAN CONSUMPTION. ADDITIONALLY, LAKE MICHIGAN IS

THE SOURCE OF DRINKING WATER FOR 10 MILLION PEOPLE. ADDITIONAL CONTROLS ON TOXICS WILL BE NEEDED IF WE ARE TO MAKE THE GRAND CALUMET RIVER SAFE FOR FISHING AND SWIMMING ONCE AGAIN.

THE SEDIMENT IN THE INDIANA HARBOR IS CONTAMINATED BY THE ACCUMULATION OF TOXICS FROM YEARS OF DISCHARGES BY INDUSTRY AND POTW'S INTO THE GRAND CALUUMET RIVER. THESE TOXICS HAVE SO FILLED IN THE HARBOR THAT SHIPS CAN SCARCELY NAVIGATE THROUGH IT. BECAUSE THE SILT HAS A HIGH CONTENT OF POISONS IN IT, IT IS COSTLY AND DIFFICULT TO SAFELY DISPOSE OF IT WHEN THE HARBOR IS DREDGED. UNLESS THE TOXIC INDUSTRIAL DISCHARGES INTO THE GRAND CALUMET ARE DRASTICALLY REDUCED, INDIANA HARBOR WILL HAVE TO BE DREDGED AGAIN, ONCE AGAIN CREATING THE PROBLEM OF SAFE DISPOSAL OF THE CONTAMINATED DREDGE SPOIL.

SECTION 7 OF H.R. 3282 WILL MAKE THIS OCCURENCE FAR LESS LIKELY. HOWEVER, IT IS UNCLEAR IF SECTION 7 OF H.R. 3282 WOULD APPLY TO THE GRAND CALUMET RIVER BECAUSE IT IS NOT PRESENTLY CLASSIFIED FOR FISHING OR SWIMMING. H.R. 3282 SHOULD BE CLARIFIED SO THAT WATERS LIKE THE GRAND CALUMET CAN ALSO FALL UNDER THE TOXIC HOT SPOTS PROVISION, AND EPA CAN THEN REQUIRE THE ADDITIONAL CONTROLS ON INDUSTRIAL DISCHARGERS TO REDUCE THE DISCHARGE OF TOXICS TO A SAFE LEVEL.

WATER QUALITY STANDARDS: INDIANA'S ARE WEAK

WE STRONGLY SUPPORT SECTION 6 OF H.R. 3282 BECAUSE IT WOULD

PREVENT STATES FROM WEAKENING WATER QUALITY STANDARDS SIMPLY TO AVOID ADDRESSING MUNICIPAL OR INDUSTRIAL WASTE PROBLEMS. EPA HAS RECENTLY PROPOSED FINAL WATER QUALITY REGULATIONS WHICH INCLUDE STRICTER RULES ON DOWNGRADING POLLUTED STREAMS AND DEGRADING HIGH QUALITY WATERS. THESE RULES SHOULD BE INCORPORATED INTO THE CLEAN WATER ACT ITSELF TO PREVENT EXCESSIVE DOWNGRADING.

FOR INSTANCE, INDIANA RECENTLY DOWNGRADED 18 STREAM SEGMENTS UNDER THE EXISTING EPA RULES, AND INDICATED THAT UP TO 50% OF ALL STREAM TRIBUTARIES ARE ELIGIBLE FOR A SIMILAR "LIMITED USE" DESIGNATION. THESE WATERS ARE LOW FLOW HEADWATERS, WITH A LOW ASSIMILATIVE CAPACITY FOR POLLUTION, AND ARE VERY SENSITIVE TO DEGRADATION. INDIANA JUSTISFIED THIS DOWNGRADING BECAUSE IT DECIDED THAT THESE WATERS HAD "POOR PHYSICAL CHARACTERISTICS" OR WERE IN AREAS "WHICH ARE INACCESSABLE TO MOST OTHER FISH DURING A SIGNIFICANT PORTION OF THE YEAR".

THIS DESIGNATION SYSTEM IS COMPLEX AND SUBJECT TO WIDE INTERPRETATION. IT HAS TOO MANY VARIABLES WHICH CAN BE EASILY MANIPULATED, AND COULD RESULT IN LENGTHY CONFUSION UPON ENFORCEMENT. IT CREATES VARIANCES FOR DISCHARGERS, AND PUTS A CLASS OF DEGRADED WATERS INTO THE REGULATION WHICH IS CONTRARY TO THE INTENT AND SPIRIT OF THE LAW. THE IWLA IS UNWILLING TO CONDEMN ANY WATERS TO SUCH A CLASSIFICATION, ESPECIALLY IF SUCH WATERS AFFECT POTABLE SUPPLIES, AQUATIC LIFE SEGMENTS, RECREATIONAL USES OR IMPAIRS THE DESIGNATED USE OF THE ADJOINING STREAM. ANYONE WISHING TO HAVE A STREAM OR WATERWAY UNDER THIS

THIS LIMITED USE DESIGNATION ONLY HAS TO SUBMIT A WRITTEN RECOMMENDATION TO THE STREAM POLLUTION CONTROL BOARD STATING THE RATIONALE FOR SUCH A DESIGNATION. INDUSTRY IS NOW MOVING OUT OF THE URBAN AREAS AND INTO RURAL AREAS TO EVADE CLEAN UP REGULATIONS BY TAKING ADVANTAGE OF THIS LIMITED-USE DESIGNATION .

NON-POINT SOURCE POLLUTION: A PLAGUE ON INDIANA'S WATERS

NON-POINT SOURCE POLLUTION HAS BEEN DESCRIBED AS "A CORNUCOPIA OF CRUD". RUNOFF FROM CITY STREETS, FARMS, AND CONSTRUCTION SITES IN INDIANA IS GIGANTIC -- 82,294,000 TONS YEARLY, ACCORDING TO THE U.S. SOIL CONSERVATION SERVICE'S (SCS) INVENTORY OF INDIANA (SEE ATTACHMENT 2.). THE MOST PERSISTENT PROBLEMS IN INDIANA ARE IN THE ST. JOSEPH, MAUMEE AND WHITE RIVER BASINS. INDIANA STREAMS ARE CHOCOLATE-BROWN ALL YEAR LONG FROM SOIL EROSION. THE SILT CONTAINS HERBICIDES AND PESTICIDES WHICH ARE HEAVILY USED IN THIS CORN AND SOY BEAN PRODUCING STATE. GREASES, OILS, SALT AND LEAD FROM AUTOMOBILE EXHAUST, DISCHARGES FROM SEPTIC SYSTEMS, SEWAGE PIPE SEEPAGES AND BARNYARD RUNOFF CONTRIBUTE GREATLY TO THE PROBLEM. RUNOFF FROM BUILDING, SHOPPING MALL, AND, HIGHWAY CONSTRUCTION SITES ADDS TO THE PROBLEM. EFFORTS TO CONTROL FLOODS BY BUILDING DIKES AND FILLING IN FLOOD PLAIN AREAS --- SUCH AS FORT WAYNE'S FUTILE ATTEMPT TO CONTROL THE FLOW OF ITS THREE RIVERS --- SPEEDS THE FLOW OF RUNOFF POLLUTION.

SECTION 208 OF THE ACT WAS DESIGNED TO PLAN CONTROLS ON RUNOFF POLLUTION. THIS PROGRAM HAS BEEN ONE BIG FIZZLE IN

INDIANA. ONLY TWO REGIONS, CENTRAL AND NORTHWESTERN INDIANA, ACCOMPLISHED CONSTRUCTIVE PROGRAMS. THE ELIMINATION OF FEDERAL FUNDING FOR 208 HAS PUT THSE PLANS IN LIMBO; OTHER PLANS HAVE BEEN FORGOTTEN. IN MY AREA, THE 208 PLAN NEVER MADE IT TO FIRST BASE BECAUSE AN OBSTINATE GROUP OF FARMERS AND OTHER SPECIAL INTERESTS FORMED AN ORGANIZATION CALLED THE "COMMITTEE TO RESTORE THE CONSTITUTION" TO DENY ANY FEDERAL OR STATE AID FOR THIS PROGRAM. CLEARLY, SUCH VOLUNTARY, NONMANDATORY PROGRAMS LIKE SECTION 208 ARE WOEFULLY INADEQUATE TO ADDRESS THIS GROWING PROBLEM.

THE SOLUTION TO THIS PROBLEM IS THE DEVELOPMENT AND IMPLEMENTATION OF "BEST MANAGEMENT PRACTICES" (BMP) TO REDUCE RUNOFF. BMP'S INCLUDE SUCH COST EFFECTIVE TECHNIQUES AS SURROUNDING CONSTRUCTION SITES WITH HAY BALES TO TRAP RUNOFF SEDIMENTS, OR EMPLOYING CONTOUR PLOWING ON EASILY ERODIBLE SOIL. STATES SHOULD BE REQUIRED TO IDENTIFY STREAMS WHERE NON-POINT POLLUTION IS A PROBLEM, AND TO IDENTIFY THE SOURCES OF THE RUNOFF. THESE SOURCES SHOULD BE REQURIED TO IMPLEMENT APPROPRIATE, ECONOMICALLY ACHIEVEABLE BMP'S ON A FIRM TIME SCHEDULE. TECHNICAL ASSISTANCE AND SOME LIMITED FINANCIAL AID SHOULD BE AVAILABLE. THE STATES SHOULD BE HELD RESPONSIBLE FOR REMOVING THIS "CRUD".

WE SUPPORT REPRESENTATIVE OBERSTAR'S BILL, H.R. 4037, TO CONTROL NON-POINT SOURCE POLLUTION, BUT WE BELIEVE IT SHOULD BE TOUGHENED TO ENSURE THAT THE SOURCES OF RUNOFF POLLUTION ARE REQUIRED TO USE BMP'S.

SEWAGE TREATMENT: MORE MONEY NEEDED

WE SUPPORT SECTION 3 OF H.R. 3282 WHICH WOULD PROVIDE BADLY NEEDED ADDITIONAL FUNDS TO BUILD SEWAGE TREATMENT PLANTS. IN INDIANA, WE HAVE UNMET SEWAGE TREATMENT NEEDS OF $3.7 BILLION, OF WHICH THE FEDERAL GOVERNMENT WILL PAY ONLY $486 MILLION BECAUSE MUCH OF OUR NEEDS ARE FOR COMBINED SEWER OVERFLOW PROBLEMS. H.R. 3282 WOULD AUTHORIZE AN ADDITIONAL $219 MILLION OVER THE NEXT 4 YEARS TO SPEED THE CONSTRUCTION AND OPERATION OF SEWAGE TREATMENT SYSTEMS. WITHOUT THESE SYSTEMS, INDIANA'S WATERS WILL CONTINUE TO BE PLAGUED BY MUNICIPAL SEWAGE PROBLEMS.

CONCLUSION: IT'S NOT TOO LATE

INDIANA'S WATER POLLUTION PROBLEMS ---THOUGH LARGE --- ARE NOT INSURMOUNTABLE. WITH A STRONG FEDERAL CLEAN WATER PROGRAM, WE CAN TACKLE OUR TOXIC HOT SPOTS, PRETREATMENT, AND NON-POINT SOURCE POLLUTION PROBLEMS. THE ENACATMENT OF H.R. 3282 WOULD HELP INDIANA --- AND THE NATION --- ADDRESS THESE PROBLEMS, AND ACHIEVE FISHABLE, SWIMABLE WATERS IN THE NEAR FUTURE.

ON THE OTHER HAND, PROPOSALS TO WEAKEN THE CLEAN WATER ACT, SUCH AS A PRETREATMENT OPT-OUT, WOULD BE AN UNMITIGATED DISASTER TO THE HEALTH AND SAFETY OF INDIANA'S ALREADY TROUBLED WATERS.

THE INDIANA DIVISION OF THE IZAAK WALTON LEAGUE URGES THIS SUBCOMMITTEE TO PASS H.R. 3282, AND TO PASS A STRENGTHENED VERSION OF H.R. 4037.

THANK YOU FOR THIS OPPORTUNITY TO TESTIFY TODAY. I AM HAPPY TO ANSWER ANY QUESTIONS.

ATTACHMENT #1

SLUDGE WARNING GIVEN ALONG WITH FORT WAYNE, INDIANA'S MUNICIPAL SLUDGE.

WARNING

THE UNITED STATES ENVIRONMENTAL PROTECTION AGENCY HAS PLACED CERTAIN RESTRICTIONS UPON THE APPLICATION OF MUNICIPAL SEWAGE SLUDGE FOR LAND APPLICATION.(FEDERAL REGULATION 40 CFR).

THE SEWAGE SLUDGE YOU HAVE RECEIVED CONTAINS BOTH CADMIUM AND PCB'S AND SHOULD NOT BE USED ON DOMESTIC GARDENS WHERE LEAFY VEGETABLES OR ROOT CROPS ARE GROWN FOR HUMAN CONSUMPTION.

THIS SLUDGE MAY, HOWEVER, BE APPLIED TO LAWNS AND CROP LAND UNDER THE FOLLOWING GENERAL CONDITIONS:

1. land used for non-food chain crops such as corn, soy beans, hay, pasture, etc.
2. where soil pH is maintained to 6.5 or greater.
3. the sludge be applied prior to plowing except under certain conditions on pasture land.

FOR FURTHER INFORMATION REGARDING YOUR SPECIFIC USES, PLEASE CONTACT THE FORT WAYNE WATER POLLUTION CONTROL PLANT AT (219) 423-7261.

VI e	18 - 25	96,000	82,000	28.84

*Average erosion rate in tons per acre per year for both treated and untreated cropland.

Mr. ROE. Please proced.

TESTIMONY OF ETHYLE BLOCH, PRESIDENT, INDIANA DIVISION, IZAAK WALTON LEAGUE; AND DANIEL WEISS, CONSERVATION ASSOCIATE

Mr. WEISS. Mr. Chairman, I don't have a statement; I'm just accompanying Ms. Bloch.

Mr. ROE. OK, we will defer to Ms. Bloch.

Ms. BLOCH. Thank you for this opportunity, Mr. Chairman, to be here today to testify on this all important Clean Water Act.

I am Ethyle Bloch, I am President of the Indiana Division, Izaak Walton League of America.

I live in Fort Wayne, Ind., the city that was so highly advertised as the "city of the 1982 flood" and named in 1983 an "All America City".

And I am here to bring you a local point of view, more or less, today.

The Clean Water Act is a vital, necessary law to clean up our Nation's polluted waters. And it places the Federal Government in the driver's seat to restore and maintain chemical, physical and biological integrity of the Nation's waters by establishing a nationwide clean water program.

The Federal authority provides the State and local governments with the push that is needed to run good programs.

The Clean Water Act established the year 1983 as the year to meet the fishable, swimmable goal. After a lot of hard work, we have partially succeeded in meeting that goal and restoring our waters by removing much of the soapsuds, dead animals, and feed lot wastes, greases, oils, and so forth—all these visible pollutants.

The remainder of the task is before us now, and that is the toughest nut to crack.

We have just begun to control the water contaminants that we cannot see—those toxic chemicals that too often are discharged into our streams from industrial pipes, municipal treatment plants, farm runoff, city streets, and construction site runoff.

These chemicals and toxics that come out of these pipes are deadly to human health. They never disappear. They commingle to form even more hazardous contaminants, or they settle into and remain in the water, in the bottom sediments or the sludge.

Scientists tediously study these chemicals and are discovering their evil effects on fish, wildlife, and humans.

Today, Congress faces a fundamental question:

Do you reauthorize and strengthen this vital Clean Water Act?

Or do you, in effect, relax the controls by budget cutting and by pushing this task onto State and local governments?

The Water Quality Renewal Act, H.R. 3282, sponsored by Representative James Howard, reaffirms the goals of the act which was established by Congress in 1972.

The Indiana division of the Izaak Walton League urges this committee to pass H.R. 3282, rather than undo the achievements of eliminating the visible pollutants and ignoring the task of combating the invisible ones.

To illustrate these concerns, I'd like to discuss with you pollution problems in Fort Wayne and Indiana. And I would like to say that I think a lot of these problems occur all over the United States.

About 10 of our 80 industries in Fort Wayne have been issued NPDES permits. However, the sewage treatment plant receives effluent discharged from about 70 of them.

And I can only give you these figures as estimates because the Fort Wayne municipal government refuses to provide bona fide statistics and facts to the public. We have been kept in the dark about these things over the years; and we still do not get the facts that we need.

These industries discharge heavy metals and organic toxics into the Fort Wayne publicly owned treatment plants, which end up in 7,000 tons of sewage sludge that is generated annually at the plant.

This sludge is placed in a square-mile area of lagoons situated in the Maumee River flood plain, where it dries for about a period of 4 years.

Every time Fort Wayne has a big flood, these lagoons are inundated with water. The toxic-laden sludge washes into the Maumee River, contaminating the water supply of cities downstream—Defiance, Ohio, is one of them—and flows into the western end of Lake Erie.

In 1982 when President Reagan was loading sandbags in Fort Wayne to save the people living behind the Pemberton Dike, the poisons from that sludge flowed into, on, and around them downstream. Poor little Lake Erie.

After 4 years' time most of this sludge is sent to the citizens for land application; they give away about 7,000 tons a year. All the warnings given to the citizens is a warning of what is in that sludge is on this little card [indicating] which is attached to my statement; sometimes they give it; sometimes they don't; but it doesn't tell you a heck of a lot.

Fort Wayne has received over $86 million in Federal funds since 1972 to expand its sewage plant; and, yet, the city does not require its industrial customers to pretreat their toxic discharges into the plant.

Effluent entering the plant is monitored for flow and a surcharge is paid on excess biological oxygen demand, chemical oxygen demand, suspended solids and phosphorus. The POTW superintendent decides on an individual contract basis whether to require the removal of toxics from this industrial effluent discharged into the plant, or to even take those wastes.

According to this superintendent, the only restriction on accepting these wastes is to prevent a "slug" of toxics from knocking out the micro-organisms in the POTW's biological treatment system.

Again, how often these "slugs" occur, we do not know, nor were we told.

Fort Wayne does not review or monitor the passthrough of metals or organics through the POTW and into the river. There is also little concern about the concentrations of toxics in the sludge.

The superintendent adjusts the rate of land application of the sludge which is based on a tons-per-acre ratio, as required by State guidelines.

It seems that they don't really make any effluent tests, but they do test the river water about three times a week.

In addition, the city's NPDES permit for its POTW has parameters only for BOD, COD, suspended solids, phosphorus and pH. There are no checkpoints to measure the success or the failure of industrial pretreatment efforts.

Indiana does not require adequate monitoring of pretreatment programs.

The Fort Wayne plant is blythely gliding along, because there are no national pretreatment requirements in place.

Decisionmaking, regulations, and enforcement are based strictly on what the traffic will bear. Pretreatment decisions are made based on what new industries can be lured by the chamber of commerce and the mayor's economic development commission, and by complaints of old industrial customers who stubbornly refuse to change their ways; and on the desire to keep the status quo with the simple requirements of their discharge permit.

Industries will find it very cost effective to be a municipal customer if national categorical and general pretreatment standards are undercut by a waiver or an opt-out for some cities.

It is logical that industries are "going to go "pollution-hunting"—"pollution-shopping," because it is happening.

Just within the last year Fort Wayne's utility consultant urged the city council to pass amendments to the sewage ordinance to increase the concentration limits in the discharge of eight heavy metals into the sewage plant to attract industries to Fort Wayne.

Cadmium and cyanide were two of those heavy metals.

And he bluntly stated that this change was designed to benefit industry by reducing treatment costs, for a mere $45,000 annual savings to the industries. The other reason he gave was that EPA was expected to relax those standards anyway.

Indiana's pretreatment regulations required by May 1982, are not yet in effect.

Categorical standards are not enforced because EPA is just issuing the standards.

In Fort Wayne, it seems that economics, and not environmental protection, is the deciding factor in pretreatment standards and programs.

These pretreatment regulations allow variances if an industry claims a different discharge factor than its national categorical standard. The pretreatment regulations contain exemptions for small communities from establishing a pretreatment program. This is a loophole for smaller communities of less than 5 million gallons daily hydraulic capacity.

After listening to this long list of problems with Fort Wayne's pretreatment and sewage treatment systems, one could argue that a community like Fort Wayne would be unlikely to receive a waiver from the National Pretreatment program, and be allowed to operate its own program.

Our concern is that Fort Wayne could, in any event, apply for an opt-out thereby triggering delays in the implementation of the national categorical pretreatment standards for its indirect dischargers.

As this subcommittee knows, when Congress created other waiver programs in the Clean Water Act, like the section 301(h) program for the discharge of untreated sewage into the ocean, many communities that were not "supposed to" receive waivers applied anyway.

This has led to a backlog of applications at EPA, and lengthy delays in meeting the requirements of the act by applicants.

A pretreatment opt-out program means years of delay in reducing the thousands of pounds of toxics discharged annually into our sewage treatment system—it would contaminate the Maumee River, either by passing through the plant untreated, or by leeching out of contaminated municipal sludge during the next big flood.

No matter how tough a pretreatment opt-out program is, it has inherent faults to the control of toxics in Indiana.

Municipal sewage treatment plants in Hammond, East Chicago, Michigan City, and Gary have all suffered from serious problems, and have violated their discharge permits for conventional pollutants.

Indiana has almost no numerical criteria for toxics, which are essential to determine whether the discharges from POTW's running their own pretreatment program are harming water quality.

The Indiana Water Pollution Control Division is very understaffed, underpaid and overworked.

A pretreatment opt-out would strain these already tight resources even further, and would take staff people away from enforcement and monitoring. Even now they do very little onsite sampling and almost nothing with the toxics; they don't have the time or the money.

My fellow Hoosier, William Ruckelshaus, noted when he testified on clean water in the Senate this year that "Any pretreatment waiver system that we were to come up with would be resource intensive, and it would cause more resources to be devoted to it at the State level as well."

So, although there may be communities in Indiana that operate better sewage treatment programs than Fort Wayne, allowing such communities to opt-out of the National Pretreatment program would ultimately harm Indiana's environment.

A better use of EPA and Indiana's limited resources is to issue the remaining national categorical pretreatment standards, and then vigorously enforce them.

To the topic of toxic hot spots—we have a bad one.

H.R. 3282 would require EPA to identify waters that will be heavily polluted with toxics even after all of the Act's existing controls are in place.

We can save EPA the trouble of coming to Indiana to identify those hot spots, because we know there they are:

The Grand Calumet River is a big one. It is one of the most polluted bodies of water in the State. Steel plants and many other industries up there discharge large amounts of cyanide, lead and at least five other heavy metals into the river, which flows directly into Lake Michigan; and Lake Michigan is a drinking-water supply source for 10 million people.

Toxics from the Grand Calumet River have poisoned fish and actually they've done away with several varieties of lake trout—they're all gone.

Additional controls on toxics will be needed if we are to make the Grand Calumet River safe for fishing and swimming once again.

However, it is unclear if section 7 of H.R. 3282 would apply to the Grand Calumet River because it is not presently classified for fishing or swimming.

H.R. 3282 should be clarified so that waters like the Grand Calumet can also fall under the toxic hot spots provision, and EPA can then require the additional controls on industrial dischargers to reduce the discharge of toxics to a safe level.

We strongly support section 6 of H.R. 3282 because it would prevent States from weakening water quality standards simply to avoid addressing municipal or industrial waste problems.

For instance, Indiana recently downgraded 18 stream segments under the existing EPA rules, and indicated that up to 50 percent of all stream tributaries are eligible for a similar "limited use" designation.

These waters are low-flow headwaters with a low assimilative capacity for pollution, and are very sensitive to degradation.

Indiana justified this downgrading because it decided that these waters had "poor physical characteristics" or were in areas "which are inaccessable to most other fish during a significant portion of the year."

This designation system is complex and subject to wide interpretation. It has too many variables which can easily be manipulated and could result in lengthy confusion upon enforcement.

It creates variances for dischargers, and puts a class of degraded waters into the regulation which is contrary to the intent and spirit of the law.

The Izaak Walton League of America is unwilling to condemn any waters to such a classification, especially if such waters affect potable supplies, acquatic life segments, recreational uses or impairs the designated use of the adjoining stream.

Industry is now moving out of the urban areas and into rural areas to evade cleanup regulations just because of this limited use designation, to take advantage of that limited use, and evade compliance.

Nonpoint source pollution has been described as "a cornucopia of crud." Runoff from the city streets, the farms, and the construction sites in Indiana is gigantic: 82,294,000 tons yearly, according to the U.S. Soil Conservation Service's inventory of Indiana—and that's attached to my statement. That much comes off our land.

The most persistent problems in Indiana happen to be in the St. Joseph, the Maumee and the White River Basins. Indiana streams are chocolate brown all year long from the soil erosion. And this silt contains herbicides and pesticides which are heavily used in this corn and soybean producing State. Greases, oils, salt, and lead from automobile exhaust, discharges from septic systems, sewage seepages, and barnyard runoff contribute greatly to the problem, as well as runoff from building, shopping malls, and highway construction sites—they all add to it.

Efforts to control floods by building dikes and filling in the flood plain areas, such as Fort Wayne's futile attempt to control the flow of its three rivers, speeds this runoff pollution.

Section 208 of the act was designed to plan controls on runoff pollution. This program has been one big fizzle in Indiana. We had only two regions, in the central area and in the northwestern part of Indiana, that have established constructive programs.

But the elimination of Federal funding for 208 has put these plans in limbo, others have been forgotten altogether.

Mandatory programs like section 208 are woefully inadequate to arrest this growing problem.

The solution to this problem is the development and implementation of best management practices to reduce runoff.

BMP's include such cost-effective techniques as surrounding construction sites with hay bales to trap runoff sediments, or employing contour plowing on easily erodible soil.

States should be required to identify streams where nonpoint pollution is a problem, and to identify the sources of that runoff. These sources should be required to implement appropriate, economically achievable BMP's on a firm time schedule. Technical assistance and some limited financial aid should be available. The States should be held responsible for removing this crud.

We support Representative Oberstar's bill, H.R. 4037, to control nonpoint source pollution; but we believe it needs to be toughened to insure that the sources of runoff pollution are required to use BMP's.

We support section 3 of H.R. 3282 which would provide badly needed additional funds to build sewage treatment plants. In Indiana, we have unmet sewage treatments needs of $3.7 billion, of which the Federal Government will pay only $486 million, because much of our needs are for combined sewer overflow problems.

H.R. 3282 would authorize an additional $219 million over the next 4 years to speed the construction and operation of sewage treatment systems. Without these systems, Indiana's waters will continue to be plagued by municipal sewage problems.

Indiana's water problems are large, but they are not insurmountable, Mr. Chairman. And with a strong, Federal clean water program, we can tackle our toxic hot spots, pretreatment and the nonpoint source pollution problems.

Enactment of H.R. 3282 would help Indiana and the Nation address these problems and achieve fishable, swimmable waters in the very near future.

On the other hand, proposals to weaken the Clean Water Act, such as a pretreatment opt out would be an unmitigated disaster to the health and safety of Indiana's already troubled waters.

The Indiana division of the Izaak Walton League urges this subcommittee to pass H.R. 3282 and to pass a strengthened version of H.R. 4037.

Again, thank you for this opportunity to testify here today, and I'll be happy to answer any questions.

Mr. ROE. Thank you very much, Mrs. Bloch, for your excellent testimony. It's very good testimony.

What was going through my mind while you were testifying was that back in 1972 we wrote this law; but how do we get somebody to carry it out in the EPA and for the States?

Do you feel we're getting proper management?

I know we need changes and we need improvement; that's what we're here for.

But do you think they're carrying the ball like it should be carried?

Ms. BLOCH. Mr. Chairman, if the Federal Government doesn't issue the guidelines and enforce those standards, which the State can be more stringent upon, they never will.

It gets to be a matter of economics again: Where do we cut? We always cut the environment. That gets the ax all the time.

But if you have the strong laws to enforce these measures, which we so badly need for our environment, that's the only way you are going to do it.

Mr. ROE. I guess it stems out of the philosophy of some people that, we shouldn't have the Federal Government running everything; we should have the States do it; they're perfectly capable; and they can do a better job; and they're right on the scene.

How do you feel about that?

Ms. BLOCH. We have a strong movement of that in Indiana. This came out so strongly in the 208 program in my region IV-B area. We absolutely fell flat on our face because of that group. You know, they don't want Federal aid, they don't want State aid; they're going to do all of this themselves.

And in the 2, 3 years since then they've done absolutely nothing.

So you hate to keep adding laws all the time, but if there are no laws to guide these people or to tell them: do this or else--it's not going to get done.

Mr. ROE. You are leading to my third question:

My third question is, there's really no penalty. You know, the penalties that have been written into the law are really basic, I mean, other than where a particularly devastating health situation may be involved; of course, then you go under the health provisions of the law.

But there aren't any strong penalties for States not to move fast. There's no penalty for the EPA not to move fast.

Do you think we should be looking to some kind of mechanisms that force these issues to be dealt with?

For example, someone goes into court, whether it's the environmentalists or the industrial group going to court, we lose another 5 years.

What should we be doing?

Should there be stronger penalties?

Ms. BLOCH. Well——

Mr. ROE. Criminal penalties?

Ms. BLOCH. I don't know about criminal penalties, but I think that if that's the only answer we can provide to come up with complying with these rules, maybe that's the way we ought to go.

I hate police action, but people ask for it.

If the community is not willing to pitch in and push from the local and State level, we have nowhere else to turn but the Federal Government for help.

Mr. ROE. Do you think the people of Indiana realize the order of magnitude of the problems to their own health and their kids' health?

Ms. BLOCH. It is becoming more increasingly evident all along, and some of this has been, I think, increased because of hazardous waste problems which—of course, the toxic and hazardous waste dumps that we have, which we find leaching into our waters, also. People are beginning to see a few things.

How much they are willing to work real hard toward this, that's growing, too; but not fast enough according to our wishes; but it is growing.

Mr. ROE. I want to thank you very much for being with us today; your testimony is excellent. We appreciate it.

Ms. BLOCH. Thank you, sir.

Mr. ROE. Our next witness, who has been waiting so patiently, is Ms. Priscilla Chapman, of the New England chapter of the Sierra Club.

And following her will be Ms. Marian K. Agnew, representing the Center for Environmental Strategy.

In fact, why don't you just come up together? You're talking about the same issues.

The full text of your prepared statements will appear in the record at this point.

[Statements referred to follow:]

Statement of Priscilla A. Chapman, Executive Director, New England Chapter, Sierra Club

Mr. Chairman and members of the Subcommittee, I am Priscilla Chapman, Executive Director of the New England Chapter of the Sierra Club. Our Chapter office is located in Boston, Massachusetts.

On behalf of the New England Sierra Club, I wish to express strong and enthusiastic support for Rep. Howard's bill, H.R. 3282, to reauthorize the Federal Water Pollution Control Act. I am speaking for over thirteen thousand Sierra Club members in our chapter's area who want to see the progress which has already been made in cleaning up our nation's waterways vigorously continued until the Act's stated goals have been achieved.

While progress has been made in restoring water quality in New England, there is yet a considerable way to go. As of January of 1980, 67% of our major stream areas met the fishable/swimmable goals of the Clean Water Act, according to the 1982 Report of the Region 1 EPA Administrator. 82% are projected to meet the standards by the end of this year. In Massachusetts, 45% of our 1,715 river miles met the standards in 1980, and Region 1 expects that about 60% may be cleaned up by the 1983 deadline.

Failures to meet the goals in certain areas are accounted for by problems of combined sewer overflows, runoff from streets, industrial areas, farms, and construction sites, delays in bringing treatment plants on line and concentrations of toxics in sediment.

The New England Chapter would like to emphasize four areas in particular where it is crucial that the Clean Water Act be maintained or strengthened, in order to continue the progress we have already made.

1. We oppose substitution by a municipality of an "opt-out" pretreatment program for the requirements to meet federal pretreatment standards which are now being promulgated by EPA. Many of our industrialized towns and cities do not have the capability of formulating standards for all the toxic substances which may be discharged into their municipal sewer systems. Several communitites in Massachusetts, in fact, have experienced problems with operations of their treatment plants, known or strongly suspected to be caused by industrial toxic pollutants in the influent entering the plant. On the North Shore, for example, influent containing significant levels of trivalent chromium at the South Essex Sewer District Plant caused plant shut-down and for a period of time, large amounts of raw sewage were being dumped into Salem Harbor.

Toxics from untreated industrial discharges form a major component of the problems with pollution of Boston Harbor. Strong pretreatment programs are

clearly needed, and should not be abandoned to the uncertainties of limited municipal personnel, constricted local budgets, and pressure from local industries on cities to set up lax programs.

2. We support the provision in H.R. 3282 which requires the EPA Administrator to identify and develop specific control strategies for toxic hotspots in non-attainment areas. Without such a provision, it is likely that areas such as the Housatonic River near Pittsfield, Massachusetts, and the upper Narragansett Bay area in Rhode Island will never achieve designated water quality levels. In the case of the Narragansett Bay, for example, serious toxic pollution problems remain despite the fact that Rhode Island has a state-regional sewer authority, set up in 1981 to manage an accelerated pollution control program, and state requirements for installing septic systems were strengthened on the recommendation of a Governor's Task Force. While progress has been made, a specific toxics strategy is clearly required in this case.

3. The Chapter enthusiastically endorses the proposed amendments in H.R. 3282 to the 301(h) waiver requirements which would require primary treatment and pretreatment of toxics equivalent to secondary treatment before granting waivers from secondary treatment, and which would prohibit waivers for discharge into estuarine waters. The Sierra Club has opposed the waiver application for Boston Harbor, submitted by the Metropolitan District Commission, and we are now studying with great concern similar applications submitted by Lynn, South Essex Sewage District, New Bedford, and Fall River. Based on the information found in the present applications, it appears that all of these proposed waivers, if granted, would have potentially significant adverse effect on water quality in the respective estuarine areas, as well as on populations of shellfish, fish, and other aquatic life. The adverse effects would primarily result from unacceptable levels of dissolved oxygen and toxic constituents in the discharges.
In the case of the waiver application for Boston Harbor, there are also serious questions about the information presented on tidal flows and current movement, and about the conclusions which were drawn on mixing of the effluent in the receiving waters and possible pollutant concentrations in bottom sediments. Requiring Boston and the other communities mentioned above to comply with the provisions of the amendments proposed for 301(h) would result in extension of their outfalls beyond bay areas to areas where greater degrees of mixing of

discharged pollutants would be expected to occur, in order for these municipalities to obtain waivers. Such extension would be likely to decrease potential for bioconcentration and sediment build-up. In addition, because these municipalities would be required to satisfy strict primary treatment standards and pretreatment equivalent to the toxic removal level of secondary treatment, there would likely be a decrease in the levels of toxics and other pollutants in the effluent. Thus waiver of secondary treatment might prove environmentally acceptable in these cases.

Savings to municipalities are still likely to result. The National Wildlife Federation has estimated that the cost to Boston of extending their outfall beyond the baseline to be around $140 million -- significantly less than the projected capital and operational/maintenance costs of a secondary treatment plant.

4. The New England Sierra Club urges the subcommittee's serious consideration of the problems of pollution from "non-point" souces. We support Rep. Oberstar's proposed amendment to address these problems, but would like to suggest additional provisions.

Increased control and elimination of point source discharges under the provisions of the Clean Water Act have made it possible to identify, characterize and quantify pollution from "non-point" sources. Under Sections 208 and 305b of the Clean Water Act, states have performed inventories of non-point pollution and described control strategies. Some states, in fact, have completed the 305b analyses in great detail. What is still lacking, however, is an across-the-board requirement for states to implement these plans.

A 1977 report by the Massachusetts Division of Water Pollution Control on Non-Point Source Pollution described the types of pollution entering each river basin in the state, and demonstrated a wide range of sources, from agricultural runoff, landfill leachate, pesticidies and erosion from forest and construction sites, to septic seepage, runoff of oil and road salt, urban industrial site runoff, and many problems with combined sewer overflows, particularly in cities with very old water and sewer systems. More recent reports have been able to quantify the abount of pollution resulting from non-point sources; for example, a recent study of a stretch of the Housatonic River in the Pittsfield area demonstrated how river pollution resulting from runoff can be measured by

subtracting pollutant load measured at the discharge point of local industrial sources from the total load measured downstream in the receiving waters. Some of the projects generated under the National Urgan Runoff Program have shown that non-point source pollution control for urgan areas need not be expensive propositions, particularly if control strategies such as catch basins, grass cover, and street sweeping are utilized in targeted areas of a city, where the largest amount and most harmful forms of runoff could be expected to occur. Other studies examining problems of combined sewer overflows have suggested that better maintenance of sewer systems and certain kinds of repairs are likely to decrease sewer overflow, without necessarily replacing entire systems. Characterization of the problems and identification of strategies, however, have not necessarily resulted in solutions. Restrictions on state and municipal budgets have diverted funding and personnel away from areas where control action is not mandated. My own state's lack of a comprehensive non-point source control policy was highlighted for me last summer when I observed a state-owned vehicle liberally spraying herbicides on trees bordering a public drinking water supply. Despite the fact that non-point sources were extensively described by the state in 1977, many of the problems remain uncontrolled today.

The New England Sierra Club does not at this time urge this committee to require uniform control strategies in each state. We recognize the wide diversity of problems in individual states and regions and the widely different strategies needed to address them. Rep. Oberstar's proposed amendment would allow states the flexibility needed to develop programs most effective for that state. We believe it is necessary, however, to add deadlines by which states must implement their programs (for example, within a six year period), and a requirement that EPA step in and administer a program in a state defers, thus providing an enforcement mechanism. We also urge that funding be provided to states, as well as technical assistance from EPA. The funding should be available for use for repairs to sewer systems, as well as other purposes.

Thank you very much for this opportunity to testify. We hope that this Subcommittee will give a strong endorsement to Rep. Howard's bill, H.R. 3282, with Rep. Oberstar's amendment.

BEFORE THE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES
THE SUBCOMMITTEE ON WATER RESOURCES

TESTIMONY OF MARIAN K. AGNEW, PRESIDENT
THE CENTER FOR ENVIRONMENTAL STRATEGY

November 9, 1983

Mr. Chairman, distinguished Members of the Committee:

My colleagues in the environmental community have spoken on the Section 404, toxics and coastal provisions in the proposed legislation, H.R. 3282. I support their positions on these issues. However, I do not wholeheartedly support the coalition proposal for Estuarine Management Conferences because the lessons of history on the Potomac Estuary have taught us that the quarter-billion-dollar-five-year authorization would be far better spent assuring that government agencies already responsible for overseeing our coastal estuaries are enabeled to do their jobs effectively.

Also offered here for your consideration is a minor amendment to improve the practical application of Section 201(g)(2)(requiring grant applicants to study and evaluate alternative waste treatment techniques providing for water reclamation or recycling and eliminating pollutant discharges).

Proposed Amendment: Title II, Section (g)(2) of the Act.

(g)(2)The Administrator shall not make grants from funds authorized for any fiscal year ... unless the grant applicant has satisfactorily demonstrated to

the Administrator that — [1]

(A) a request for competitive proposals (RFP) for all reasonable alternative waste management techniques which fulfill the goals and objectives of Title I, Section 101, and the purpose of Title II, Section 202, has been advertised in at least three national newspapers and at least three trade journals which are widely circulated within the water pollution control industry; and

(B) Alternative waste management techniques have been studied and evaluated and the works proposed for grant assistance will provide for the application of the best practicable waste treatment technology over the life of the works consistent with the purposes of this title; and

(C) as appropriate, the works proposed for grant assistance will take into account and allow to the extent practicable the application of technology at a later date which will provide for the reclaiming or recycling of water or otherwise eliminate the discharge of pollutants.

This proposed amendment, an addition to the 1972 Amendments, brings §201(g)(2) up-to-date. More than ten years ago, when this section originally was written, reclaim-

---

1. The proposed amendment is differentiated by script type.

20-955 O—84——147

ing and recycling of water and elimination of pollutant discharges was anticipated. Today, it is a reality. Many communities around the nation already have constructed these cost-effective clean systems; many more are planned.

The most pressing major problem remaining is informing community leaders who are shopping for effective low-cost treatment technology about what is available. Typically they are not told accurately about alternatives to conventional treatment which are competitively advantageous. They are usually given only limited options recommended by their local engineer. Decision makers then do not have a complete understanding about what technology is available - no real choices from which to pick the best alternative.

Moreover, when recycling alternatives are studied, they are misrepresented or undervalued. Costs are inaccurate and inflated. Those who have had experience with conventional systems only, understandably cannot and will not speak in favor of their competitors. As a result, in the usual Environmental Impact Statement, alternatives become "straw men", systems to be evaluated and dismissed as unacceptable for one reason or another. To date, the market has been largely controlled by the hardware and chemical manufacturers, consultants, academics and the construction grants bureauracracy within EPA. Less than 10% of EPA grants have been spent on the kind of alternative technology, slow rate irrigation, which meets the recycling and "no discharge" requirements of the Act. The time has come to break open the competitive process

and to require that the most recent, inexpensive and effective technology be presented to those who have to determine how to spend community tax dollars and to live with the results. Requiring requests for proposals prior to the Step I process can accomplish this end.

A practical example illustrates this point. Public officials in Stevens City, Virginia were ordered to improve wastewater facilities. They refused to join a large regional system because of cost. An RFP was circulated and received nine proposals. After presentations by the responding consulting firms, they chose a slow-rate irrigation system which will recycle their sewage "problem" into a revenue-producing asset as part of an overall development plan. Recycling wastewater will, therefore, become a net benefit to the community as well as saving tax dollars. The system chosen is, in fact, so inexpensive that the City fathers decided to finance construction themselves without asking for Federal funds.

By contrast, officials of the City of Rehoboth, Delaware are planning to build a conventional plant discharging to the Lewes-Rehoboth Canal. The Final E.I.S discarded alternatives which limited the decision process to unimaganitive and costly projects. The Canal is used extensively for swimming and fishing, crabbing and other water-related activities. The site chosen is a recently inactivated landfill in a salt marsh. It is actively outgassing methane, a highly flammable gas. State officials have submitted a request to EPA for permission to lower the Water Quality Standards in the Canal by more than half - below the lethal limit for many species of

fish, in order to accommodate the sewage plant discharge. They maintain that, in spite of the discharge, the uses of the Canal will not be changed. If built as planned, the plant will hasten the eutrophication of Rehoboth Bay, continue to pollute the Canal and thereby limit its use to the Community. Extremely high ongoing operational costs for treatment and sludge disposal will be incurred. The Rehoboth plant also may well become the first federally-funded exploding sinking sewage treatment facility in the country. All efforts made by citizens so far to presuade officials to stop this outrageous project and circulate an RFP for a better and cheaper alternative have failed.

It has become abundantly clear, therefore, that the conventional pollution control industry cannot be allowed to continue to resist the changes mandated by amendments to the Clean Water Act since 1972. Millions of dollars allocated for the innovative/alternative "set aside" have been wasted because they have not been spent on these low-cost effective projects. Meanwhile, our rivers and lakes are becoming clogged with algae and the nutrients, nitrogen and phosphorus, are discharged in ever greater amounts. Algal contamination of our raw water sources is causing ever higher levels of trihalomethanes in finished drinking water after chlorination. The conventional seperation approach to treatment is causing enormous sludge problems, both cost and disposal. Witness the fact that as the Potomac is temporarily cleaner, the high-rise mountain

of sludge grows taller - and no one knows what to do about getting rid of it.

Likewise, our beautiful and enormously productive estuaries are dying because of nutrient enrichment. This can be stopped only by preventing point source discharges and non-point-source leaching upstream. Here again, technology is well advance by scientists outside the conventional sanitary and civil engineering professions, taking a holistic approach to the problems. If local communities were fully aware of the effectiveness of these technologies, the benefit to both the local community and its downstream neighbors, they would certainly take full advantage of it.

Limited options are simply costing too much, environmentally and financially. It is time to turn loose the American free enterprise system and let the public know the wide range of promising new ideas available now. This can be done by amending §201(g)(2) to include a competitive search for creative and effective alternatives before any project can be federally funded.

Proposed deletion: §319 of H.R. 3282.

Section 319 proposes resurrecting the "Conference" notion which was the only means of planning for watersheds before the 1972 amendments. It was ineffective then; it will be even more ineffective now because the authority given the conferees will duplicate and/ or compete with programs started more than ten years ago and currently in effect under the current legislation. Section 319

authorizes the Conferees to make river basin master plan and to implement them by recommending priority corrective actions addressing point and non-point sources of pollution, monitoring, developing water quality and toxicity standards, effluent limitations, and to develop best management practices. Admittedly, these are positive actions which must certainly be taken to protect the estuarine regions of the coast.

However, Section 303(e) and Section 209 of the Act already demand both State and River Basin plans. Areawide waste management was supposed to have been addressed pursuant to Section 208 of the Act. Admittedly, most of these programs have failed. The reason for that failure is easy to see: river basin planning starts with land use planning, the source of water pollution. If and when public officials are convinced that they have to start making decisions about what happens between the raindrop and the river, planning will begin in earnest. Until that time, spending nearly a quarter-billion dollars on another duplicative bureaucracy won't speed up the process. Throwing more money at a program that has not worked usually doesn't get results. On the other hand, cutting budgets unless some progress is made might get successful results. If EPA would only say that no projects would get federal grants unless and until the planning process produced projects which will remove nutrients, clean-up of all estuaries would begin immediately. Clean-up of our surface raw-water sources would certainly be an important additional benefit because it would substantially reduce the amounts of cancer-causing trihalomethanes in our finished drinking

water.

Before adding more financial fuel to the fire, please consider the words of Mr. Bill Roulette, a Tilghman Island waterman and Chairman of the Izaac Walton League's Chesapeake Bay Committee. "We all screwed up the Chesapeake Bay because we are too selfish, and lazy and too dominated by self-seeking land grabbers. Now we are playing with something bigger than all of us put together." "The facts are known and the facts are constantly ignored." "It kills me to hear people say, 'We are interested in cleaning up the Bay.' If they were really interested, they would not allow the bureaucrats to run wild. It's just the mouthings of politicians ... it doesn't amount to a hill of pins." "The thing that's so aggravating is that we have all these high-priced studies, but nobody has done a thing." (attached).

The "thing" recommended here is an amendment to the Act which will start the competitive creative American free-enterprise system started at the local level cleaning up local systems in the area where pollution originates, confining disposal of pollutants so they will not migrate to cause water or other pollution and allowing more efficient use of the chemical energy contained in wastewater to offset costs of treatment. Land treatment, the most effective alternative technology in most cases, establishes the relationship between the volume of wastes generated by numbers of people (both municipal and industrial) and the amount of land required to reconvert these wastes into usable

energy.

As such, it is primarily a land use planning tool.

Respectfully submitted,

Marian K. Agnew

Pollution Brings the Chesapeake to Bay

DENIS COLLINS/Outdoors

EASTON, Md.—After seven years and $27 million, the Environmental Protection Agency this fall finally produced its report on the health of the Chesapeake Bay. It is thicker than War and Peace and about as exciting as the phone book. And Bill Roulette has read every word.

Must have been pretty good, eh, Bill?

"On the subjects they picked to write about, they did a workmanlike job."

Guess it made you feel better about the future of the Bay?

"Baloney."

If you have at least a nodding interest in local news, you are probably aware of the whistling political winds that have been blowing of late across America's largest estuary. Blue ribbon government panels and scientific foundations have probed and poked the Chesapeake with clinical intensity. Congressional delegations have been fed facts and oysters while bobbing on its blue-green swells.

On Monday evening, no less a personage than Walter Cronkite will moderate a panel discussion about the Bay at Easton High School here.

It would seem that great forces are at work to improve the declining health of the Chesapeake. But if you talk to the people who make their living on the Bay, such as Roulette, a 57-year-old waterman from Tilghman Island, that supposition sounds as hollow as a carnival barker's pitch.

"The facts are known and the facts are constantly ignored," says Roulette, white-haired, blue-eyed captain of the Barneckle, a 35-foot wooden work boat. "It kills me to hear people say, 'We are interested in cleaning up the Bay.' If they were really interested, they would not allow the bureaucrats to run wild. It's just the mouthings of politicians . . . it doesn't amount to a hill of pins."

Roulette is vice president of Maryland's Izaak Walton League and chairman of that conservation organization's Chesapeake Bay Committee. He is called upon half a dozen times a year to represent watermen at state functions. He may not always be right, but he is always informed.

And, after more than 10 years of listening to reports and promises while watching the Chesapeake continue to deteriorate, he is beginning to sound a little bitter.

"The thing that's so aggravating is that we have all these high-priced studies, but nobody has done a thing," says Roulette. "Things have not changed one iota."

The EPA report confirmed what the watermen knew too well already. The Bay, 180 miles long and 30 miles wide, is not as healthy as it once was and appears to be getting worse due to chemical runoff from farms and industry and contamination by heavy metals and other toxic materials. Chlorine-treated waste from hundreds of sewage treatment plants has adversely affected the reproductive capacity of fish, crabs and oysters.

In the past 20 years, for example, the Bay's oyster harvest has dropped from 30 to 20 million bushels a year. The catch of striped bass, formerly the Chesapeake's premier sport fish, has dropped by almost 80 percent during the same period.

"There used to be year-round work for a waterman on the Chesapeake," says Roulette, who moved to Tilghman Island, about 20 nautical miles south of the Bay Bridge, 11 years ago after quitting a job running a printing shop in Philadelphia.

"In winters, you would go after oysters. In spring, you'd use seine nets for herring, shad, rock, white and yellow perch. Then there'd be eel potting, then trotlining for crabs. There's no fishing any more. The waterman has to make it with just two spots, crabbing and oystering."

When Roulette talks to citizens' groups, he is careful to distribute blame for the Bay's condition over a wide area, and concedes commercial fishermen must accept their fair share.

"We all screwed up the Chesapeake Bay because we are too selfish, and lazy and too dominated by self-seeking land grabbers. Now we are playing with something bigger than all of us put together. The Chesapeake Bay is the prime source of basic food for all of the Atlantic fishing, from Nova Scotia to Jacksonville. We're messing up the protein on other people's tables.

"When I go around to talk to people, it doesn't do me much good to talk about the survival of the Bay in terms of oysters and crabs. There aren't that many people who like oysters and crabs. It's nice to talk about skipjacks and watermen and old ways, but it doesn't allow you to get into the pocketbooks needed to fix it."

Last month, Roulette took me to a meeting between Maryland Congressman Roy Dyson and supporters of the St. Michael's Maritime Museum. Dyson is sponsor of an amendment to the Clean Water Act that will authorize about $50 million in federal aid over a four-year period to help reduce pollution in the Chesapeake. But when asked about the likelihood of getting the money for which he was asking, Dyson sounded very much like Roulette.

"There's tremendous support right now for cleaning up the Chesapeake Bay," began Dyson. "But when it comes to the real support, comes to signing that line, it gets a little murky. In an election year, they're not going to raise taxes. That may be the program to cut."

COMMENTS ON THE FINAL EIS ON THE REHOBOTH
BEACH SEWAGE TREATMENT PLANT

The comments attached to this cover sheet address problems in both the EIS process and in the methods used to lower the Water Quality Standards in the Lewes-Rehoboth Canal. Since the discharge must by law conform to its NPDES effluent limitations, and the effluent limitations must be based on water quality standards, and the water quality standards must be based on water uses, there is, in my opinion, no way to disengage the issues raised here:

1. Even though the shellfish and body contact recreation uses for the Canal have been kept, reducing the dissolved oxygen standard to 3.0 mg/l daily average and 2.0 mg/l daily minimum admits that dead fish and NO swimmers will soon be seen if DO drops to that level.

2. If you are looking at a body of water for potential pathogens, you test for fecal strep as well as fecal coliform. I found no fecal strep analysis in the EIS. You did admit that regrowth came primarily from STP effluent, not marsh coliform.

3. The EIS does not admit that for the past 20 years, the City has dumped its sludges into the Canal. The benthic DO demand of that bottom load has not been established by on-site tests.

4. Mayor Hughes of Rehoboth Beach has told us that since the Final EIS was promulgated, the City and its consultant have changed the in-plant process from rotating biological contacters to an oxidation ditch. They have also changed chlorination and dechlorination to ultra violet radiation. Whether the sand filters have been kept is not known. The new process must be evaluated.

5. The STPs proposed at Rehoboth Beach and Lewes lock the area jurisdictions into a plan of poor quality treatment at high cost and high O&M from now on. The kinds of secondary treatment proposed have a poor track record for compliance. The package plants proposed are viewed with horror by most jurisdictions because they are always out of compliance. Use of septic tanks will continue to pollute surface and ground waters. East of the highway, whatever flows flows to the Canal, amd the Canal is on the verge of going septic.

6. This may be the nation's first exploding sinking sewage treatment plant because it is to be built in a marsh on a landfill containing organic matter which is still in the process of decomposing. EPA admits outgassing methane. Supporting the weight of a 15 foot deep concrete ditch on pilings in order to keep it from cracking may be exhorbitantly expensive. A second opinion is needed here.

7. Even better, send out an RFP for new approaches. Since there is no way to discharge secondary treatment anywhere in the area and meet tidal standards, go for no discharge with an I/A system.

COMMENTS ON THE PROPOSED REHOBOTH BEACH AND LEWES SEWAGE TREATMENT PLANTS DISCHARGING TO THE LEWES REHOBOTH CANAL DELAWARE - U.S. EPA REGION III

1. The hydrology and assimilative capacity of the Canal is not properly evaluated in the EIS because both are based on assumptions and conclusions from a second-hand model of the Murderkill River, not on on-site data.

The Lewes/ Rehoboth Beach/ Dewey Beach area of the coastal Delaware shoreline extends from Cape Henlopen to the northern boundary of the Delaware Seashore State Park. The individually incorporated areas east of the Lewes/ Rehoboth Canal are located on the barrier island between an extensive salt marsh system and the Atlantic Ocean. The Canal begins as an extension of the Broadkill River at the Lewes end and is cut south to Rehoboth Bay through the marshes. Roosevelt Inlet, approximately 1 Km north of Lewes, permits the Delaware Bay tides to flush out the Canal to approximately the northern end of the developed area of Rehoboth Beach. This high tide seems to drive the tidal system. It is approximately one hour ahead of the far less powerful Rehoboth Bay tide and sweeps the discharge from the small STP at Lewes (.75 mgd) through the Inlet at low tide.

The Rehoboth Bay tide, on the other hand is neither high nor strong enough to flush out the Canal. From the very inadequate data contained in the consultant's report, the net flow of only a few cuf to the Bay seems to have far less flushing action than the Delaware Bay tide. The Rehoboth Beach STP, located just south of the 14th Street Bridge discharges into the Rehoboth Bay tidal reach. The extent of the STP plume at high and low tides is not discussed in the Draft or Final EISs. Another major factor affecting the assimilative capacity of the Canal at this point is the cumulative effect of sludges discharged into the Canal at the STP since 1969.

The assimilative capacity of the Canal seems to have been determined by a mathematical model prepared by the Consultant to determine treatment plant components for the Kent Co. STP on the Murderkill River. The report on that River stated that some of its model inputs were not determined by actual verifiable data. For example, the benthic O demand was taken from the literature on

---

1. Jensen, Paul A.1981, Water Quality Analysis of the Lewes, Rehoboth Canal, Delaware, Document No. 8171, Delaware Division of Environmental Control, Dilly, Dover, Delaware.

the Houston, Texas Ship Channel by guessing at its similarities with the Canal. Moreover, inputs for DO in the Marsh flux were not taken from the Canal marshes. Since the Murderkill is a fresh water river emptying into a tidal marsh and the Canal is a salt marsh drainage system emptying at both ends, not simultaneously, it seems doubtful that the same model and unverified assumptions can determine the assimilative capacity of the Canal when it was designed to assess the treatment train on the Murderkill STP.

2. Effluent limitations are based on continued degredation of water quality, thereby necessitating illegally lowering water quality standards by half.

In August 1982, after the Draft EIS was promulgated, officials in the Delaware Department of Natural Resources lowered the Water Quality Standards in the Lewes/Rehoboth Canal from an average daily value of 6.0 mg/l for dissolved oxygen to 3.0 mg/l. Minimum DO values were lowered from 5.0 mg/l to 2.0 mg/l. The Consultant's reports were cited to justify the change because they seemed to indicate that the marshes, not the sewage treatment plants and sludges were the cause of a continuous low DO condition in the Canal. Whether EPA has legally approved this change is not known.

As far as we have been able to determine, the State did not change the uses of the Canal from shellfish and body contact recreation. The 3/2 standards are not adequate to support fish and shellfish. In fact, if allowed to occur, they will certainly cause certain areas of the Canal to go septic, killing every species dependent upon oxygen levels exceeding 4 mg/l.

Neither the consultant's reports nor the EISs contain any bioassays of the Canal. Our on-site inspection of the Canal from the Roosevelt Inlet to Rehoboth Bay on August 12, 1983, showed no fish kills, no septic conditions. The only area visibly degraded was south of the 14th Street Bridge, the area of the Rehoboth STP discharge. Because the plant has added aerators, there was practically no smell in the discharge area. However, further downstream, the usual sewage odors were discernable.

Reading the consultant's reports on the Murderkill and Canal and the Draft and Final EISs on the Lewes and Rehoboth STPs together, it is clear that the Canal discharges could not be allowed unless Water Quality Standards were lowered by half. The recommendation is first seen in the Draft EIS on the Rehoboth STP in Appendix C, prepared by the State. "The Delaware Water Quality Standards for Streams criteria for tidal streams should be revised during the next revision cycle (in 1982) to reflect 2.0 mg/l instantaneous minimum and 3.0 mg/l daily average dissolved oxygen standards for the Lewes/ Rehoboth Canal." Appendix C at 11. The wasteload allocations for the Rehoboth STP are based on these standards.

The Final EIS, prepared by EPA states that "The dissolved oxygen standard is to be lowered in order to make water quality goals realistic and attainable." Final EIS at 3. This action is clearly illegal under the Clean Water Act - and totally unprecedented.

3. These STPs are the first phase canal discharges leading ultimately to other STPs or package plants sewering development west of the Canal.

Proposals for the Lewes and Rehoboth STPs leave completely unanswered questions about clean-up for overflowing septic fields in the developing area of Sussex County along Rte. 14 west of the Canal. In one scheme, package plants discharge to the Canal directly between the Rehoboth bridges and at Bay Vista. Five pumping stations can be assumed to have bypasses. Other package plants discharge to the headwaters of the marsh system that drains to the Canal above the developed areas of North Shores and Henlopen Acres. These discharges will undoubtedly create other degraded areas in the Canal similar to the area near the existing STP. Package plants have developed a bad reputation for performance. Since the General Accounting Office has reported that municipal plants function within their permitted effluent limitations only approximately 60% of the time, package treatment plants can be assumed to be even less effective. The Colonial East package treatment plant which has created septic conditions near Wolf Glade, tributary to the marsh, is a model for the kinds of problems anticipated with decentralized and improperly supervised systems.

4. Information in both the Draft and Final EISs is irrelevant because the City of Rehoboth has discarded the alternative selected by EPA and chosen instead unevaluated STP components during the Step II process.

During our interview with Mayor John Hughes of the City of Rehoboth Beach, he said that the plans for the plant had been completely changed. Instead of the Rotating Biological contactors and sand filters with chlorination and dechlorination, the City has chosen an oxidation ditch and ultra violet disinfection. These processes were rejected by the Final EIS. Why they have replaced the original choices was not explained - except that they were deemed to be cheaper. If this is the case, the Final EIS must be republished with justifications for the change and explanations as to cost, levels of treatment, efficacy, and environmental impact. We have serious doubts that a single oxy-ditch system can adequately handle flows which are 10 times greater in summer than in winter. We also want to know what retention times are required for ultra violet disinfection - and how large the holding tanks will have to be to treat the high summer flows. It is improper to conduct an EIS process with public participation and, after that process has been completed and approved by EPA, to completely change the essential components in the plant processes, unilaterally.

5. Neither the Draft nor Final EISs adequately resolve sludge disposal problems.

We were informed by Mayor Hughes that the City had finally stopped discharging its sludge to the Canal and had started depositing

the Hudson Farm near Milton, Delaware. Evidently, sludge is interred into the ground when it is not raining. At other times, sludge is delivered to the Kent County STP for disposal there. We do not know what method is used at Kent Co, but should be told.

Sludge disposal is an ongoing plague connected with the use of conventional sewage treatment plants. Logically, the more pollutants removed the greater the amounts of sludge. These sludges are concentrated pollutants which contain a high percentage of water. Under the best conditions, they migrate as non-point source surface runoff. Under the worst, they migrate to pollute the groundwater.

A recent study of groundwater contamination of the aquifers under the State has shown that high levels of nitrogen are found where chicken manure is applied to the land.[2] The problem will also occur with sludge except that it is probably worse because there is more sludge than manure and it is already over 50% water. Even though the sludge from the Rehoboth and Lewes plants will probably not contaminate the aquifers in this area, it should not be allowed to contaminate any other groundwater. It seems rather peculiar that the groundwater contamination concerns were so fully amplified in the chapters concerning land treatment (where sludge is not a problem) and have been left completely unexamined in the section on land application of sludge.

6. Descriptions of land treatment systems in both the Draft And Final EISs show that the writers are not familiar with recent recycling technology which closes the farm/city loop and could replenish and cleanse the aquifer.

Land application and recycling is considered an innovative alternative (I/A) type of treatment which will continue to be funded at 75% federal grants after the federal share for conventional treatment plants drops to 55% in 1985. The problem most small communities face is finding a competent consultant to work with them on their problems. The kinds of systems described in the Draft EIS betray little knowledge of the integrated systems approach to design a proper land application system. Alternative g, p 7-8 is a good example. It proposes conventional secondary treatment and ridge and furrow application and concludes that this treatment is not cost effective. Such components are only useful in an extremely limited land area where the land application system is really a polishing component rather than a treatment step. In the Rehoboth area, where there are miles and miles of farmland growing high nitrogen demand crops, slow rate irrigation after secondary treatment

2. Ritter, William F. and Chirnside, Anastasia E.M., 1982, Ground Water Quality in Selected Areas of Kent and Sussex Counties, Delaware, For DNREC, Dover, DE 19901.

in a "farm pond" should be discussed. This kind of system could probably operate far more effectively than any conventional treatment system where the summer loading rates are 10 times those generated by the winter population because farms need more water in summer. Unless sludge is desired,none is generated because it is allowed to biodegrade in the bottom of aerobic lagoons. No odors are generated because the lagoons are kept aerobic. (This is the technique used by the City of Rehoboth to clean up odors at its present primary plant.) Land could be leased or purchased. It could be in one place or in several, depending on the availability and placement of the conveyance system.

We have seen references to the LeCato system and the problems relating to it. The Negative Declaration clearly showed that whoever designed the system had no real idea of how a well designed land treatment system should work. For example, large areas were set aside for sludge disposal. None are needed. The system could be designed to take septage (pumped out septic tank wastes from current problem areas) as well as sludge that would be used to generate methane in a digester. The methane then runs a generator to put electricity back into the grid - to defray the cost of treatment. Whatever is grown on the farm can be harvested and turned into alcohol in a still. There is a good market, which is growing, for alcohol for fuel - at gasoline prices. Or the corn could be sold on the market. In summary, a land treatment system is simply a well run farm using irrigation techniques after secondary treatment in an aerated lagoon to raise valuable crops with fertilizer supplied by the effluent. It is the only economical way to remove nutrients ata net financial benefit to the users of the system. The tortured alternatives described as land treatment demonstrate clearly that those who prepared them have little experience with designing cost-effective recycling systems. After more than ten years, EPA should know better.

I suggest that before land treatment systems are rejected out of hand,the applicant for federal funds be required to show that a request for proposals, including the discharge limitations, was circulated to all consultants developing this technology. Only after the proposals are evaluated and costed-out can the applicant choose the most effective and cheapest system for the community in a competitive and businesslike way.

Respectfully submitted,

Marian K. Agnew

Thomas Eichler, Regional Administrator
U.S. Environmental Protection Agency,
Region III
6th and Walnut Streets
Philadelphia PA 19106

Dear Mr. Eichler:

Within a month, Region III will receive an application from the City of Rehoboth, Delaware for Step III money to build a 3.3 mgd sewage treatment plant discharging to the Lewes-Rehoboth Canal. This letter requests immediate extensive chemical and biological water quality testing in the Canal and marshes before that construction grant is approved. I stress "immediate" because worst case conditions exist only during August before Labor Day when both visiting and resident population peaks and the weather is hottest.

To accommodate this discharge, as well as those anticipated from package treatment plants proposed as a solution for the overflowing septic fields west of the Canal, the State of Delaware lowered by more than half its dissolved oxygen standards for the Canal in 1982. The 3.0 mg/l daily average and 2.0 mg/l minimum were justified by a mathematical model of the Canal and salt marsh system. It purported to show that the low DO levels seen during parts of the year were "natural" conditions justifying the change.

Both the model and critical inputs were taken from work done on the Murderkill River to determine the treatment train for the Kent Co. STP. Furthermore, the most recent data used to verify it was gathered in 1979. The model itself may, therefore, be faulty; the data used to verify it is certainly out of date.

As you know, the Canal is highly visible. It is also too important a recreational resource to have to discard. The State has recognized this by keeping tidal water uses, body contact recreation and shellfish, even though DO could be lowered so that these uses become impossible.

EPA has qualified experienced scientists who can collect good data on present conditions in the Canal and marshes. I hereby respectfully request that you initiate a comprehensive monitoring program immediately, including both bioassays and chemical data, to determine the assimilative capacity of the Canal.

As requested by your staff, my comments on the Final EIS are attached.

Sincerely,

Marian K. Agnew

August 18, 1983

Mr. William D. Ruckelshaus, Administrator
U.S. Environmental Protection Agency
401 M Street, S.W.
Washington, D.C. 20460

Dear Bill:

Within a month, Region III will get an application from the City of Rehoboth, Delaware for Step III money to build the first exploding sinking sewage treatment plant in the country. It is to be built on a landfill in a marsh beside the Lewes-Rehoboth Canal within two miles of the Rehoboth Bay Sailing Club - and only a mile from the Country Club. In order to legitimize the discharge, the State illegally lowered the dissolved oxygen standard in the Canal by half, from the shellfish and body contact recreation DO levels of 6.0 mg/l to 3.0 mg/l daily average, and from 5.0 mg/l to2.0 mg/l minimum. They used a second-hand mathematical model which was originally designed to determine the in-plant processes for the Kent Co. STP on the Murderkill River to show that the background levels of DO caused by water moving in and out of the marsh on the tide were causing the problem. They did not show that the City STP had been dumping its sludge into the Canal for 20 years or that the disynchronous tides at both ends almost make it a sink. The present tidal water shellfish uses have been kept.

Before anything else is done, EPA has to get some good data. I have called both the Water Programs section here and have talked to Region III. I keep running into the two people who probably already know the problem intimately, Green Jones and the new Region III Administrator, Mr. Eichler. He worked for the Delaware Department of Environmental Resources which designed and approved this scheme. I asked for help.

While the weather is hot - and lots of people are in residence, we need the Canal waters tested thoroughly. The marshes should also be included, especially since one of the marsh tributaries has a nasty package plant on it. This is the last chance for a year.

Finally, the City and its consultant have changed the in-plant process completely since the Final EIS. They and EPA approved rotating biological contacters and sand filters. The latest scheme (we were told by the Mayor) is an oxydation ditch. Chlorination has also been changed to ultra violet radiation. My engineers tell me that where the summer population is 10 times the winter population, they would have to have two complete systems to make an oxy-ditch work properly. Since the GAO says that these systems are out of compliance at least 40% of the time anyway, it doesn't look good.

Thanks for whatever help you can give us. Glad to have you back.

Marian

P.S Please have your staff send me whatever data is available to document the effectiveness of ultra violet for inactivating bacteria and viruses with a secondary effluent. I am particularly concerned because this is an international community in the summer-time. The potential for an exotic variety of microorganisms in domestic sewage discharges exists. The STP discharges to waters where people catch crabs and eat them. People also swim in the Canal. Public health implications are obvious.

Thanks,

MKA

McLean, VA 22101

Dear Ms. Agnew:

This letter is in response to your letter to Mr. Eichler dated August 17, 1983, concerning the City of Rehoboth sewage treatment plant. You requested chemical and biological testing of the Lewes-Rehoboth Canal prior to EPA approval of a pending construction grant application for the Town of Rehoboth Beach, on the grounds that adequate information currently was not available upon which to make our funding decision.

I must respectfully deny your request for immediate additional sampling. The Lewes-Rehoboth area has been the subject of extensive controversy, and as a result, extensive study and evaluation since at least 1975. EPA has been deeply involved in the review and approval of the effluent limits developed for the plant discharge as well as the revisions to the water quality standards. We are satisfied that there was sufficient water quality data available to support those decisions. Therefore, I can see no need for additional studies at this time.

I also appreciate your comments on the final Rehoboth Environmental Impact Statement (EIS) and would like to briefly address the concerns you have raised in the same order that they were presented.

1. Dissolved oxygen (DO) does not affect the contact recreation value of a body of water as long as the DO does not drop to zero. Therefore, lowering the DO standard in the Lewes-Rehoboth Canal to 3.0 mg/l average will not affect swimmers.

   The standard was changed to provide a more realistic water quality goal. The revised standard reflects the naturally depressed DO conditions of the canal and is not intended to accommodate any wastewater discharges in the area. Some of the information in support of this change is available from the water quality model of the Lewes-Rehoboth canal developed by Espey, Huston, and Associates, Inc. This model was calibra-

ted to a significant amount of physical and chemical data collected in the Lewes-Rehoboth Canal in 1979. Since we know of no significant changes to the canal since the data was collected, we feel that the data and therefore the model is valid. The model projects that there will be a negligible effect on the DO in the canal from discharges of even greater flows than those being considered in the design of the proposed Lewes and Rehoboth facilities. It is also interesting to note that two DO measurements taken in the canal during the September 29, 1979, model survey were between two and three mg/l. In summary, we believe that this standard change will not affect the DO conditions that presently exist in the canal.

2. While it is true that no fecal strep analysis was presented in the EIS, we believe that the use of the standard fecal coliform tests was justified for our evaluations.

3. The EIS preparers had no documentation or reason to think that Rehoboth has disposed of its sludge in any way other than landfill and land injection as it has stated it has done.

4. Rotating biological contactors (RBC's) and oxidation ditches have both been utilized extensively for achieving secondary treatment levels. The State has established effluent limitations to which Rehoboth must comply. So long as the discharge requirements are met, the EPA views the systems as environmentally equal.

5. The treatment facilities will dramatically improve effluent quality. Any proposed package plants in the area (none of which are to be funded by EPA or the State) will be required to provide a level of treatment similar to Rehoboth Beach's effluent limits. The wasteload allocation for any such package plants will be taken from the future reserve set-aside which was established when the Rehoboth Beach effluent limits were determined, and thus will not exceed the Canal's assimilative capacity.

6. A value engineering study has been performed which led to the selection of the oxidation ditch over the previously selected RBC units.

7. Innovative and Alternative systems were evaluated by the Facilities Plan and the EIS. A request-for-proposal would only delay the improvement of the wastewater treatment (which will reduce biological oxygen demand loadings, reduce coliform loadings, reduce coliform regrowth, reduce pathogens, and eliminate the potential chlorine toxicity) which we, as you, so greatly desire.

Sincerely yours,

Greene A. Jones

CHOLERA — A POSSIBLE ENDEMIC FOCUS IN THE UNITED STATES

PAUL A. BLAKE, M.D., DONALD T. ALLEGRA, M.D., JOHN D. SNYDER, M.D., TIMOTHY J. BARRETT, B.S., LOUISE MCFARLAND, M.P.H., CHARLES T. CARAWAY, D.V.M., JOHN C. FEELEY, PH.D., JOHN P. CRAIG, M.D., JOHN V. LEE, PH.D., NANCY D. PUHR, B.S., AND ROGER A. FELDMAN, M.D.

Abstract In September and October 1978, after a case of cholera had been discovered in southwestern Louisiana, 10 more *Vibrio cholerae* O-Group 1 infections were detected in four additional clusters. All 11 infected persons had recently eaten cooked crabs from five widely separated sites in the coastal marsh, and a matched-triplet case-control study showed a significant relation between cholera and eating such crabs (P = 0.007). *V. cholerae* O1 was isolated from estuarine water, from fresh shrimp, from a left-over cooked crab from a patient's refrigerator, and from sewage in six towns, including three without identified cases. All isolates in Louisiana and an isolate from a single unexplained case in Texas in 1973 were biotype El Tor and serotype Inaba; they were hemolytic and of a phage type unique to the United States — suggesting that the organism persisted undetected along the Gulf Coast for at least five years. (N Engl J Med 302:305-309, 1980)

SEVEN cholera pandemics have occurred since the early 1800's. The seventh pandemic, caused by the El Tor biotype of *Vibrio cholerae* O1, began in 1961 in Indonesia, spread throughout Southeast and South Asia, the Middle East, Africa, portions of Europe, and several Pacific island groups, and continues today.[1,2] Although its incursion into the developing countries of the Western Hemisphere has been feared and expected for a decade, it was considered unlikely that the disease would become established in countries such as the United States, which have relatively good water supplies and sewage disposal.[3] However, after the discovery of a case of cholera in Abbeville, Louisiana, in 1978,[4] an investigation led to detection of 10 other *V. cholerae* O1 infections in four additional clusters, determined that the vehicle of transmission was cooked crabs from Louisiana marshes, and found evidence suggesting that similar organisms had persisted undetected along the Gulf Coast for at least five years.

From the Bacterial and Field Services divisions, Bureau of Epidemiology, and the Bacteriology Division, Bureau of Laboratories, Center for Disease Control, the Louisiana Department of Health and Human Resources, the Department of Microbiology and Immunology, Downstate Medical Center, State University of New York, and the Public Health Laboratory, Maidstone, Kent, England (address reprint requests to Dr. Blake at the Center for Disease Control, 1600 Clifton Road N.E., Atlanta, GA 30333).

Presented in part at the Interscience Conference on Antimicrobial Agents and Chemotherapy, Boston, October 2, 1979.

BACKGROUND

Southwestern Louisiana south of highway Interstate 10, where Abbeville (1975 population, 12,739) is located, is a flat lowland only a few meters above sea level. A largely uninhabited brackish marsh extends approximately 40 km inland from the Gulf of Mexico (Fig. 1). The area is noted for its seafood, and shrimp and crabs are shipped from there to other states.

Cholera was first recorded in Louisiana in 1832, and the last known case occurred in 1873. The United States had only one culture-proved case of nonlaboratory, domestically acquired cholera between 1911[5] and 1978; a single unexplained case was discovered in Port Lavaca, Texas, in August 1973.[6]

On August 10, 1978, a 44-year-old man who lived in Abbeville, Vermilion Parish, Louisiana, and had no history of foreign travel became ill with diarrhea, a temperature of 38.3°C, and nausea. He had copious watery bowel movements approximately hourly, his weight decreased by 5 kg, and he was hospitalized on August 13 because of dehydration. A presumptive vibrio species isolated from his stool was forwarded to state and federal laboratories and was ultimately identified by the Center for Disease Control on September 4 as *V. cholerae* O1, the organism that causes epidemic cholera.

Methods and Results

Epidemiologic Investigation

To determine whether other *V. cholerae* O1 infections were occurring, we began surveillance of sewage and of diarrheal illnesses in southwestern Louisiana. We surveyed sewage by periodically suspending rolls of gauze (Moore swabs)[7] for 24 to 48 hours in flowing sewage at the end points of 28 municipal sewerage systems in 22 municipalities (Fig. 1). In September, October, and November, *V. cholerae* O1 was isolated from sewerage systems in six municipalities, and persons with cholera were simultaneously or subsequently found in three of these cities and towns. We surveyed diarrheal disease by asking physicians to obtain rectal swabs from all patients with diarrhea, encouraging bacteriology laboratories to use thiosulfate citrate bile salts sucrose (TCBS) agar in culturing diarrheal stools, and providing Cary-Blair transport medium to laboratories, private physicians, and public-health units so that fecal swabs could be sent to state regional laboratories. Through surveillance of diarrheal illnesses, four additional hospitalized persons with cholera were found (Patients 2, 4, 5, and 6, Table 1).

The index patient and the four patients with cholera detected by surveillance were interviewed so that we could obtain detailed histories regarding the week before onset of illness and identify all persons who had been in close contact with the patients or who had shared meals with them. Rectal swabs from 65 such "contacts" led to identification of three symptomatic persons (Patients 7, 8, and 9) and three asymptomatic persons (Patients 3, 10, and 11) with *V. cholerae* O1 infections (Table 1). The 11 infected persons were from 12 to 69 years old and lived in five towns. In the month before infection, none had traveled out of state, and only one had taken antacids; none had had an operation involving the stomach. Onset occurred during a two-week period (September 14 to 27) corresponding with the beginning of surveillance in the second week of September (Table 1).

The 11 infected persons had only one food or beverage in common: crabs. Eight with symptoms had eaten boiled or steamed crabs two to five days before onset of illness, and three without symptoms had eaten them within nine days before culture. The crabs eaten by the 11 infected persons came from five lots caught in August and September at five sites up to 130 km apart in the marsh (Fig. 1). The crabs were alleged to have been boiled for 10 to 20 minutes (eight infections) or steamed for 20 to 35 minutes (three infections). Six infected persons ate the crabs within half an hour after cooking, and there was no evidence of post-cooking contamination of crabs eaten by three of these persons.

To determine whether eating crabs was significantly associated with cholera, we performed a matched-triplet case-control study. For the index infected person in each of the five clusters (Patients 1, 2, 4, 5, and 6), we systematically selected two neighborhood control subjects matched by sex and age (±5 years). The subjects in each triplet were asked about their consumption of crabs and five other foods in the five-day period before the infected person became ill. Control subjects were also asked about foods eaten in the five-day period before the questionnaire was administered. The only significant difference between exposures of infected persons and controls was consumption of crabs; none of the 10 controls had eaten

Figure 1. Sources of Epidemiologically Implicated Crabs and Municipalities with Sewerage Systems Tested for *V. cholerae* O1, Southwestern Louisiana, August-November 1978.

crabs in either time period, but all five infected persons had eaten crabs in the five days before they became ill ($P = 0.007$ by a method described by Miettinen[4]).

To determine whether other cases of cholera had occurred in Vermilion Parish in the recent past, we obtained single serum specimens in late September from each of 10 persons who had visited the Abbeville General Hospital emergency room at any time between June 1 and September 11, 1978, because of diarrheal illnesses without rash or temperatures higher than 39.9°C. Seventy-five control serum specimens were obtained from Abbeville residents stratified by age, sex, and location of residence to represent the population over the age of nine years. Two of 10 patients seen in the emergency room (onsets, July 1 and 2) and none of 75 survey subjects had three or more cholera antitoxin (anti-PF) units per milliliter[8] ($P = 0.013$ by Fisher's two-tailed exact test).

Environmental Investigation

Between September 12 and October 9, we attempted to recover *V. cholerae* O1 from seafoods and the environment in the sites from which the crabs had come and from the entire area between Vermilion Bay and Mud Lake (Fig. 1). We also looked for evidence of fecal contamination of the area. We cultured 110 live crabs from 60 geographic sites, approximately 400 shrimp from 41 sites, 27 oysters from four sites, frozen cleaned crabs and shrimp from the freezer of Patient 1, frozen cleaned crabs belonging to Patient 4, three refrigerated whole boiled crabs left over from those eaten by Patients 6 to 9, and 165 Moore swabs that had been submerged in canals, lakes, bays, and rivers for 24 or more hours. *V. cholerae* O1 was isolated from one of the three boiled crabs, from shrimp caught in a canal near Pecan Island, and from two Moore swabs — one from a canal near Pecan Island and one from a canal east of White Lake. Sewage commonly drained into canals flowing into the marsh. In 155 surface-water samples, 48 (31 per cent) of the fecal coliform counts exceeded 200 per 100 ml of water. The fecal coliform counts in the sites where the incriminated crabs were caught were approximately the same as the counts in other areas tested.

Laboratory Investigation

All specimens for culture were placed into alkaline peptone broth for six to 12 hours at 37°C and then plated to TCBS agar.[9] Fecal swabs were plated directly to TCBS agar. Suspect colonies were transferred to heart infusion agar (HIA). Colonies from HIA were screened with polyvalent O *V. cholerae* antiserum, and those agglutinating in the antiserum were further identified biochemically and serologically.[11] Isolates identified as *V. cholerae* O1 were tested for toxin production in the Y-1 adrenal-cell assay[12] and in a microtiter solid-phase radioimmunoassay.[13] Four *V. cholerae* O1 isolates were also tested for quantity of toxin production in the rabbit-skin assay.[9,14] All *V. cholerae* O1 isolates from patients, sewers, and the environment were *V. cholerae* biotype El Tor, serotype Inaba; they were toxinogenic by both assays, and hemolytic on sheep-blood agar. In the rabbit-skin assay, two strains produced distinctly more toxin in unshaken than in shaken cultures, as is typical of El Tor strains, and the other two strains tested produced approximately equal amounts of toxin under both growth conditions.

In a comparison of the hemolytic activity of the Louisiana *V. cholerae* O1 strains with that of El Tor biotype strains from elsewhere, 38 strains from Louisiana, a strain from the patient in Texas who had cholera in 1973, and 35 strains collected between 1961 and 1978 from Asia (22), Africa (eight), Europe (two), and Oceania (three) were tested with a tube dilution method described by Feeley and Pittman.[15] The strains from Louisiana and Texas had hemolysin titers of 1:16 or greater. Of the strains from the Eastern Hemisphere, four of seven collected in 1961 to 1963 and only one of 28 collected in 1964 to 1978 had hemolysin titers of 1:16 or greater, and the rest had titers of 1:2 or less.

All 38 isolates from Louisiana and the isolate from Texas (1973) were phage-typed at the Public Health

Laboratory in Maidstone, England, with use of the four classical and five El Tor cholera phages of Mukerjee[15] and eight experimental phages. All the strains from Louisiana and the one from Texas were of the same phage type: they were sensitive to El Tor phages 1, 2, and 5, and to five of the experimental phages. The pattern of phage sensitivities in the strains from Texas and Louisiana was not observed in tests by the Maidstone Public Health Laboratory of 1085 other strains of *V. cholerae* O1 found all over the world and isolated during 1964 to 1979.

In an effort to determine whether *V. cholerae* O1 can survive in crabs that are cooked, boiling and steaming experiments were carried out in duplicate with artificially infected crabs. We infected live blue crabs from Louisiana coastal waters by placing them for 10 hours in seawater containing 10^4 *V. cholerae* O1 from Louisiana per milliliter. After packing in ice for five or more hours, 26 live infected crabs were put one at a time in boiling water and cooked for two to 14 minutes, or put in a large covered pot and steamed for five to 30 minutes. *V. cholerae* O1 was isolated from all crabs boiled for two to eight minutes or steamed for five to 25 minutes but not from any crabs boiled for 10 to 14 minutes or steamed for 30 minutes. Crabs boiled for eight or steamed for 25 minutes were red, and the meat was firm and appeared well cooked.

Discussion

We suspect that *V. cholerae* O1 was introduced into the United States in 1973 or earlier and persisted along the Gulf Coast until 1978. The strongest evidence in favor of this hypothesis is the fact that the isolate from Texas in 1973 and all the isolates from Louisiana five years later were of a single phage type that is unique to the United States. In addition, the isolates from Louisiana and Texas were strongly hemolytic, unlike almost all other El Tor strains isolated worldwide in the past 15 years.[17] Finally, the fact that all the cases reported here could easily have escaped diagnosis suggests that clinicians and laboratories could have missed sporadic cases of cholera, even severe or fatal illnesses, because the disease was not known to be endemic and appropriate laboratory methods were not being used.

The mechanism by which *V. cholerae* O1 could persist for years along the Gulf Coast is unclear. Long-term persistence could occur through generation of a cycle in the marshes: fecal contamination of marsh water by infected persons, contamination of crabs by the water, consumption of inadequately cooked contaminated crabs, further human infections, and further fecal contamination of the marshes. Similar cycles involving other seafoods have been postulated in Portugal[18] and the Gilbert Islands.[19] In 1979, despite intensive surveillance of sewerage systems and persons with diarrheal illnesses in southern Louisiana, no toxinogenic *V. cholerae* O1 strains were isolated; although this result suggests that sporadic cases may be too rare to cause such a cycle to persist, it may have resulted from effective control measures (see below). Chronic carriers of *V. cholerae* O1 have been observed,[19,21] and a carrier in the area could make the cycle operate intermittently. It is conceivable that typical toxinogenic and virulent *V. cholerae* O1 can multiply in the environment and persist indefinitely without additional human fecal contamination. However, studies in India and Bangladesh have failed to support this possibility.[22,23] Careful surveillance and further ecologic studies will be required to determine the manner in which the organism persists.

Although raw or minimally cooked seafoods have been vehicles for cholera transmission,[18,19,24,25] the incriminated crabs in Louisiana were well cooked by traditional criteria. Since the lowest dose of *V. cholerae* O1 of the classical biotype that causes diarrhea in volunteers fed the organism in water is 10^8 vibrios,[26] the presumably small number of surviving vibrios in freshly cooked crabs should pose little risk. However, several factors may have contributed to infection of persons eating crabs. First of all, the infected persons may have had defective production of gastric acid, which is an important barrier to *V. cholerae* O1 infection[26-28]; this possibility was not investigated. Recent studies of volunteers at the University of Maryland have shown that when given with antacids, inocula of *V. cholerae* O1 of the El Tor biotype containing as few as 10^3 vibrios cause high attack rates of mild diarrhea (Levine MM: personal communication). Secondly, ingestion of *V. cholerae* O1 in food apparently lowers the infectious dose: studies in volunteers have shown that severe diarrhea can be induced by 10^4 *V. cholerae* O1 of the El Tor biotype given without antacids in a standard meal but not by the same dose given with water alone (Levine MM: personal communication). Thirdly, *V. cholerae* O1 adsorbs to chitin and is protected from acid by this adsorption[29]; small inocula may successfully traverse the gastric acid barrier adsorbed to small pieces of chitin-containing crab exoskeleton. Finally, in the crabs that were not eaten at once after cooking, the surviving vibrios may have multiplied; *V. cholerae* O1 can multiply in other foods[30,31] and in chitin suspensions.[19]

Since the results of the investigation suggested that large areas of the marsh harbored small numbers of *V. cholerae* O1, the state urged the public to boil crabs from the marsh for at least 15 minutes and required commercial establishments to steam crabs under pressure or to boil them for 15 minutes. Construction and improvement of sewage-treatment facilities in southwestern Louisiana was accelerated. To protect persons in other states, Louisiana cultured crabmeat from crab-processing plants, and the United States

Food and Drug Administration cultured 1110 live crabs from shipments leaving the state; all cultures were negative. Louisiana has maintained surveillance of selected sewerage systems and of persons with diarrheal illnesses for *V. cholerae* O1, and the Center for Disease Control has urged other Gulf Coast states to do the same. Physicians should be alert for the disease and ask their laboratories to look specifically for *V. cholerae* O1 when patients have severe watery diarrhea.

We are indebted to the patients' private physicians, the staff of Abbeville General Hospital, the physicians, nurses, sanitarians, engineers, and microbiologists of the Louisiana Department of Health and Human Resources, and the staff of the Epidemiologic Investigations Laboratory Branch, Center for Disease Control, for assistance, and to H. L. Smith, Jr., Ph.D., Jefferson Medical College, Philadelphia, for *V. cholerae* O1 strains.

CHOLERA ON A GULF COAST OIL RIG

JEFFREY M. JOHNSTON, M.D., DEBORAH L. MARTIN, R.N., M.N., JAMES PERDUE, B.A., LOUISE M. MCFARLAND, DR.P.H., CHARLES T. CARAWAY, D.V.M., M.P.H., EDWIN C. LIPPY, M.S., P.E., AND PAUL A. BLAKE, M.D., M.P.H.

Abstract A single case of severe diarrhea on a floating Texas oil rig was followed two days later by what proved to be the largest outbreak of cholera in the United States in over a century. After isolation of toxigenic *Vibrio cholerae* El Tor Inaba of the typical United States phage type from the index patient's stool, the ensuing investigation detected 14 additional cases of cholera and one asymptomatic infection serologically. Infection was associated with eating rice on the oil rig on a particular day ($P = 0.03$) when an open valve permitted the rig's drinking-water system to be contaminated by canal water containing sewage (including that from the index patient) discharged from the rig. The rice had been rinsed in the contaminated water after cooking, and before being served it had been maintained at a temperature that allows *V. cholerae* 01 to multiply. Toxigenic *V. cholerae* 01 is persisting in the United States, and large common-source outbreaks of cholera can occur if proper sanitation is not maintained. (N Engl J Med 1983; 309: 523-6.)

THE first known case of cholera acquired in the United States since 1911 occurred in a resident of the Gulf Coast of Texas in 1973.[1] In 1978, 11 more *Vibrio cholerae* 01 infections were detected in southwestern Louisiana,[2] and in early summer 1981, two cases of cholera were identified in southeastern Texas.[3] The vehicle of transmission in Louisiana[2] was undercooked locally harvested crabs, and in Texas it was unknown.[3] All toxigenic *V. cholerae* 01 isolates in Louisiana and Texas have been of biotype El Tor and serotype Inaba, strongly hemolytic, and of a unique phage type, leading to the suggestion that the organism is endemic along the Gulf Coast of the United States.[2]

Although only a few *V. cholerae* 01 infections were detected in the United States, the persistence of the pathogen along the Gulf Coast indicated that there was a constant threat of potentially explosive water-related outbreaks of cholera if public or private water supplies became contaminated. In the fall of 1981, our investigation of a single case of cholera detected a cholera outbreak caused by a contaminated drinking-water system aboard a floating oil rig in Texas. The outbreak proved to be the largest involving cholera in the United States in over a century. The investigation showed that even typical cases of cholera are easily misdiagnosed, serologic methods are useful in investigating recent toxigenic *V. cholerae* 01 infections, household contacts of cases did not become infected, and large common-source outbreaks of cholera can occur in the United States.

CASE REPORT

On September 20, 1981, a 23-year-old man from Louisiana had profuse watery diarrhea, abdominal cramps, nausea, and vomiting. By the fourth day of illness, he was extremely weak and had orthostatic syncopal episodes. Nonetheless, he did not seek medical attention until eight days after onset. A stool specimen was obtained for culture at that time. He was not hospitalized and recovered at home on symptomatic therapy. *V. cholerae* was isolated from the stool, identified by the Louisiana health department laboratory as *V. cholerae* 01 serotype Inaba, and subsequently determined at the Centers for Disease Control to be of the El Tor biotype.

Preliminary investigation by the Louisiana and Texas health departments found that the illness began five days after the patient began a seven-day tour of duty aboard a barge-type oil rig on a marshland bayou south of Port Arthur, Texas. Two crews lived on the rig on alternate weeks, and specialized workers made brief visits to the rig. The index patient said that most other employees who worked during his tour of duty (September 13 to 22) had also had a recent diarrheal illness, so a full investigation was begun.

METHODS

All persons who had visited or lived on the rig between September 14 and 28, 1981 (one week before and one week after the most likely date of common-source exposure as detailed below) were identified and interviewed. Stool or rectal swab and blood specimens were obtained from all who consented. Household contacts of rig workers who were subsequently determined to have had a recent *V. cholerae* 01 infection were interviewed in late October, and stool or rectal swab and blood specimens were obtained from all who consented.

The rig's two water systems (drinking water and untreated bayou water), sewage system, and galley were inspected. Fluorescein dye was used to trace sewage effluent. Galley personnel were interviewed regarding food sources and handling. Samples of frozen seafood and drinking water were obtained. On October 4 and 14, Moore swabs[4] were placed for 24 hours or more in the bayou surrounding the rig, the sewage effluent, the sewage-treatment tanks, the ballast-intake port, and the drinking-water reservoir.

Rectal swabs were transported in Cary-Blair medium and cultured for *V. cholerae* on thiosulfate citrate bile salts sucrose (TCBS) agar; stool specimens were plated directly on TCBS. Moore swabs were transported and enriched in alkaline peptone broth and cultured for *V. cholerae* on TCBS agar.[5] The isolate from the index case was tested at the Centers for Disease Control for toxin production by enzyme-linked immunosorbent assay (ELISA)[6] and Y-1 adrenal-cell assay.[7] Dr. John Lee of the Maidstone (England) Public Health Laboratory determined hemolysin production[8] and phage type.[9] Dr. James Kaper of the University of Maryland performed molecular genetic analysis with a probe to detect the genes responsible for production of heat-labile toxin.[10] The Centers for Disease Control measured serum vibriocidal antibodies[11] and antitoxic IgG antibodies in duplicate by microtiter ELISA,[12] using Calbiochem-Cholerogen and Cholerogen supplied by Dr. M. M. Levine.

An oil rig worker was considered to have had a recent *V. cholerae* 01 infection if the organism was isolated from his stool or if assays of his serum met the serologic criteria established by Clements et al. in studies of volunteers:[13] a reciprocal Inaba vibriocidal antibody titer of 320 or more and an antitoxin level of IgG by ELISA at least four

times greater than that of the negative control serum (P/N≥4) in both ELISAs. A rig worker was considered not to have been recently infected with *V. cholerae* 01 if his Inaba vibriocidal antibody titer was less than 1:160, if both antitoxic antibody assays yielded a result of P/N<4, and if he had not had diarrhea (three or more liquid stools in 24 hours) between September 14 and 28. Those falling into neither category were excluded from all analyses.

Results

Epidemiologic Investigation

Sixty-six of the 71 men (30 members of the rig staff and 41 visiting workers) known to have been aboard the rig between September 14 and 28 were located and interviewed. Stools and rectal swabs for culture (from 59 persons) and serum samples (from 62 persons) were obtained between October 4 and November 20. No vibrios were isolated from the stools or rectal swabs. By our definitions, 16 of 62 men (26 per cent) were infected, 29 (47 per cent) were not infected, and 17 (27 per cent) were excluded.

The 16 infected men had a mean age of 26.2 years (range, 19 to 42) and lived in Louisiana (13 men), Texas (1), Mississippi (1), and Alabama (1). Nine were rig employees and seven were service personnel. Only one had been asymptomatic; 15 had had symptoms compatible with cholera, including diarrhea (100 per cent), abdominal cramps (53 per cent), nausea (40 per cent), and vomiting (27 per cent). Eight had more than one liquid stool each hour for more than 24 hours. Three (20 per cent) of the 15 persons with symptoms sought medical attention, and two of these were hospitalized and given intravenous fluids, although cholera was not suspected. The median duration of illness was 5 days (range, 1 to 12).

All cases occurred in workers who were on the rig at least once during the period September 15 to 22. The onsets of illness occurred between September 20 and 25, with 87 per cent occurring on September 22 (six men) or 23 (seven men) (Fig. 1). All infected workers were on the rig on September 21, whereas at least three were off the rig on all the other days. Only for that day was presence on the rig associated with infection independently of presence on other days (P = 0.02, Mantel–Haenszel test).

Only one of four meals (supper) served on September 21 was associated with *V. cholerae* 01 infection (P = 0.01, Fisher's two-tailed exact test); all 14 infected persons with onset of illness after that date and the asymptomatic infected person ate this meal. Fourteen of these 15 infected persons and two of five uninfected persons recalled eating rice and gravy at supper (P = 0.03, Fisher's two-tailed exact test). The role of drinking water as a risk factor could not be evaluated because everyone on the rig drank water from the drinking-water system. Potential risk factors that were not found to be significantly associated with *V. cholerae* 01 infection included the amount of water consumed, rig duties, work shifts, antacid use, seafood consumption, gastric surgery, having blood group O, and vaccination status (Table 1).

Figure 1. *Vibrio cholerae* 01 Infections According to Date of Onset of Diarrhea, Texas Oil Rig, September 1981.

Environmental Investigation

The nonpotable salt-water system pumped water for drilling and flushing from the bayou at 28,124 kg per square meter (40 lb per square inch) (Fig. 2). Fresh drinking water was pumped from a tank at 14,062 kg per square meter (20 lb per square inch) to bathrooms and galley fixtures. One commode was connected to both systems through two valves to allow use either on location (bayou water) or when under tow (fresh water); ordinarily, only one valve was open at a time. Shortly before noon on September 21, after many workers had complained that morning that the drinking water tasted salty, both valves to this commode were discovered to be open. The valves had been inadvertently opened simultaneously late in the evening of September 20, establishing a cross-connection. Because saline bayou water was under higher pressure, it entered the drinking-water lines. A check valve had prevented contamination of the drinking-water tank, so when the error was discovered, the fresh-water valve was closed, and the fresh-water system was purged for one hour. Drinking water obtained 13 and 23 days later had no detectable free chlorine, and cultures yielded many noncoliform bacteria.

Sewage from the rig was discharged into the bayou approximately 30 m (100 ft) upstream of the ballast-intake port (Fig. 2). Fluorescein dye flushed down a commode appeared in the sewage effluent and flowed along the side of the barge directly to the ballast-intake port.

Investigation of food-handling procedures found that dry rice was routinely boiled at 10 a.m., rinsed with cold water from the galley drinking-water tap after cooking, and then held in warming pans for the rest of the day to be served at both lunch and supper. The temperatures of food in the warmers during the investigation on October 13 ranged from 21 to 58°C; to keep the food moist during the eight hours between preparation and supper, temperatures were intentionally kept low, and tap water was added frequently. The cook recalled using the salty water on September 21 to prepare food and to reconstitute drinks.

Laboratory investigation

The *V. cholerae* 01 El Tor Inaba strain from the index patient was toxigenic and strongly hemolytic. The phage-sensitivity pattern was identical to the unique pattern demonstrated in previous U.S. isolates.[2] The strain's genetic material encoding cholera toxin formed the same distinctive pattern on agarose-gel electrophoresis as had that of previous U.S. isolates.[14] *V. cholerae* 01 was not recovered from the stools of any other ill or well persons obtained from two to eight weeks after the onset of illness in the index patient.

None of the 56 household contacts of the 16 infected persons had a diarrheal illness within one week after the infected persons returned home. Serum specimens from 43 such contacts did not have antibody titers that met the serologic definition of a recent infection. *V. cholerae* 01 was not isolated from the stool of 41 healthy contacts or from water, sewage, food, or the environment.

Discussion

Although the source of infection for the index patient was unknown, it was clearly not the result of recent importation of *V. cholerae* 01, because the organism isolated from the patient's stool was identical to all toxigenic *V. cholerae* 01 strains that have been isolated from domestically acquired cases and from the environment in the United States since 1973.[2,14,15] The ensuing outbreak resulted from a chain of preventable errors that began with the discharge of the index patient's stools in sewage from the rig into the bayou. Then, as shown by the dye study, bayou water containing sewage flowed to the intake for the salt-water system. A coincidental cross-connection on September 20 and 21 permitted contaminated water from the high-pressure salt-water system to enter the low-pressure drinking-water system. Although some workers may have been infected by drinking the water, we believe that rice contaminated by the water was probably the principal or only vehicle of transmission. First of all, infection was associated with eating supper on September 21 and with eating rice and gravy at that meal; all but one of the infected persons recalled eating the rice and gravy. Secondly, the infective dose of *V. cholerae* 01 biotype El Tor is relatively high,[16] and the rice was more likely than the water to have contained an infective dose. The organisms from the index patient's stools must have been greatly diluted by the time they reached the drinking-water spigots. However, the cooked rice was rinsed with the contaminated drinking water and held for most of the day on September 21 at temperatures that permit rapid multiplication of El Tor *V. cholerae* 01 in cooked rice.[17] Also, volunteer studies with the organism have shown that the infective dose is even higher when it is given with water than when it is given with food.[18]

Two observations suggest that the infecting dose in this outbreak was relatively high. The infection rate was high, with 14 (88 per cent) of 16 persons (excluding the index patient) who ate rice and gravy at supper on September 21 having serologic evidence of recent infection. Also, the proportion of infected persons who had symptoms was high: 14 (93 per cent) of the 15

Table 1. Evaluation of Potential Risk Factors for *V. cholerae* 01 Infection among Persons Present on the Oil Rig on September 21.*

Risk Factor	Infection Status†		P Value*
	Infected‡	Not Infected§	
Drank ≥6 glasses of water/day on rig	7/14	3/7	0.644
Ate seafood during previous 7 days	10/14	8/9	0.611

persons infected when the cross-connection occurred had symptoms, giving a case-to-infection ratio of 1:1.1, as compared with ratios of 1:1.4 for the 1978 Louisiana infections[2] and 1:4.9 for infected persons in an El Tor *V. cholerae* 01 epidemic in Bangladesh.[18] Both factors — high infection rate and high proportion of symptomatic infections — have been associated in volunteer studies with a relatively high infecting dose.[16]

Cholera was not suspected in any of the cases; the isolation of *V. cholerae* 01 from a stool culture was unexpected, and without it the outbreak would never have been identified. Many more domestically acquired toxigenic *V. cholerae* 01 infections may have occurred than the 30 recorded since 1973.[1,2,15]

On September 22, the 16 infected men returned to their homes and 56 family contacts, but none of the contacts subsequently had a diarrheal illness, and none of the 43 contacts tested had serologic evidence of a subclinical *V. cholerae* 01 infection. Similarly, the 1978 Louisiana investigation of 44 close contacts of 11 infected persons found no evidence of secondary spread.[19] In countries with a high incidence of cholera, family members of persons with cholera are frequently found to be infected, but the source of their infections is unknown and controversial[20]; like the ill person, they may be infected by food or drink contaminated outside the home, or the case may have infected them through direct contact or indirectly by contaminating their food or water. The evidence so far suggests that transmission within households occurs rarely if ever in the United States.

Since the cluster of diarrheal illnesses in oil-rig workers was not recognized until more than two weeks after the onset in the index patient, stool cultures were not useful in identifying infected persons; thus, we had to rely on serologic assays. Recent studies have documented the specificity of assays for vibriocidal and antitoxic antibodies in convalescent-phase serum specimens in identifying infections with *V. cholerae* El Tor Inaba.[13,19] To minimize the likelihood of incorrectly identifying uninfected persons in the epidemiologic analysis as cases, we used a highly specific serologic definition of recent *V. cholerae* 01 infection.[13] We also used specific criteria for uninfected persons that left 27 per cent of the rig workers in an intermediate category that was not included in the analysis. Although there may have been some infected persons in the excluded category, the outbreak can be understood without them, and this investigation demonstrates the usefulness of serologic methods in the investigation of recent *V. cholerae* 01 infections.

The cholera outbreak resulted from a combination of factors, including the occurrence of sporadic toxigenic *V. cholerae* 01 infections along the Gulf Coast, failure to treat sewage adequately, the presence of a cross-connection, failure to chlorinate drinking water, and failure to maintain cooked food at temperatures high or low enough to prevent multiplication of *V. cholerae*. As long as toxigenic *V. cholerae* 01 persists in the United States, the threat of large community outbreaks of water-related or foodborne infection persists. Such outbreaks can be prevented, and are apparently being prevented thus far, through the installation and proper maintenance of water and sewage systems and by the use of elementary precautions in food handling.

We are indebted to the patients' private physicians and personnel of the state and local health departments of Alabama, Louisiana, Mississippi, and Texas for assistance in the investigation; to John V. Lee, Ph.D., for phage typing; to Donna D. Cruce, M.S., for antitoxic antibody testing; to Wallace E. DeWitt, M.S., M.P.H., for vibriocidal antibody testing; and to James Kaper, Ph.D., for molecular genetic analysis.

COMPUTED TOMOGRAPHY OF THE CENTRAL NERVOUS SYSTEM

A symposium entitled "Update on Computed Tomography of the Central Nervous System" will be held at the Acapulco Princess Hotel in Acapulco, Mexico, February 25-March 2. The fee is $385.

Contact the Program Coordinator, Office of Continuing Education, Upstate Medical Ctr., State University of New York, 750 E. Adams St., Syracuse, NY 13210; or call (315) 473-4104.

PEDIATRIC DERMATOLOGY

The Ninth Annual Pediatric Dermatology Seminar will be held at the Carillon Beach Hotel in Miami Beach, Fla., February 25-28. The fee is $190.

Contact Dr. Guinter Kahn, 16800 N.W. 2d Ave., Miami, FL 33169; or call (305) 652-6600.

CLINICAL GENETICS

A symposium entitled "Clinical Genetics for Primary Care Physicians" will be held at the University of Wisconsin in Madison on February 26 and 27. The fee is $150.

Contact Sarah Z. Aniakson, Continuing Medical Education, 6638 WARF Bldg., 610 Walnut St., Madison, WI 53706; or call (608) 263-2856.

MOTOR SKILLS

A seminar entitled "Ender Nailing: A Motor Skills Course with Hans Ender, M.D." will be held at the University of California–Davis Medical Center in Sacramento on February 26 and 27. The fee is $200.

Contact Ardi Nieuwenger, Office of Continuing Medical Education, School of Medicine, University of California, Davis, CA 95616; or call (916) 752-0328.

CLINICAL SYMPOSIUM

St. Jude Children's Research Hospital will hold its Sixteenth Annual Clinical Symposium on February 26 and 27 in Memphis. Registration is limited. There is no fee.

Contact the Associate Director for Clinical Research, St. Jude Children's Research Hospital, Box 318, Memphis, TN 38101; or call (901) 522-0300.

CARDIOLOGY

A seminar entitled "Acute MI—The First Six Hours" will be held at the Tampa Marriott Hotel in Tampa, Fla., on February 26 and 27.

Contact the American Heart Assoc., Hillsborough County Chapter, P.O. Box 4833, Tampa, FL 33677; or call (813) 253-0023.

CANCER AND VITAMINS

The First International Symposium on the Modulation and Mediation of Cancer by Vitamins will be held at the University of Arizona in Tucson, February 23-26.

Contact Mary Humphrey, University of Arizona Cancer Ctr., Tucson, AZ 85724; or call (602) 626-6044.

OCCUPATIONAL SAFETY AND HEALTH

The Occupational Safety and Health Winter Institute will be held in Daytona Beach, Fla., February 22-26.

Contact Larry D. Hyde, Occupational Safety and Health Educational Resource Ctr., University of North Carolina, 109 Conner Dr., Suite 1101, The Professional Village (346A), Chapel Hill, NC 27514; or call (919) 962-2101.

CORRECTION

"Recurrent Genital Herpes: Reinfection or Reactivation" (vol. 305 [Nov. 26] 1981) In the reply by Corey, Holmes and Reeves on page 1547, the next to the last sentence in the second paragraph should have read as follows: "New sexual partners were reported by 16 per cent of patients who did not have recurrences, as compared with 14 per cent of those who did (P>0.05)." We regret the error.

SPECIAL REPORT

EPIDEMIOLOGIC ASPECTS OF THE CURRENT OUTBREAK OF KAPOSI'S SARCOMA AND OPPORTUNISTIC INFECTIONS*

SINCE June 1981, the Centers for Disease Control (CDC) has learned of an increased occurrence of Kaposi's sarcoma, *Pneumocystis carinii* pneumonia, and other serious opportunistic infections concentrated among homosexual men in the United States. After receiving the initial reports,[1-4] the CDC formed a task force to undertake surveillance for these disorders and conduct epidemiologic and laboratory investigations. This report describes these surveillance activities and summarizes current knowledge of the epidemiologic aspects of this outbreak.

SURVEILLANCE AND REPORTING METHODS

Case-report forms were completed for biopsy-proved cases of Kaposi's sarcoma in persons under 50 years of age without underlying immunosuppressive disease or therapy. Reports were also completed on all life-threatening or fatal opportunistic infections documented by biopsy or culture from patients with no known underlying illness or history of immunosuppressive therapy. The cases summarized below fit this case definition and were reported to the CDC between June 1 and November 10, 1981. For each case reported, an epidemiologist interviewed the attending physician by telephone and recorded both demographic data (age, race, marital status, sexual preference, and residence) and clinical information (illnesses, dates and methods of diagnoses, presence and dates of onset of signs and symptoms, history of predisposing conditions, and outcome of therapy).

To examine the incidence of Kaposi's sarcoma before 1980, we contacted epidemiologists associated with selected tumor registries in New York, California, and Georgia. Information was obtained from the National Cancer Institute Surveillance Epidemiology and End Results registries in the San Francisco Bay and Atlanta areas through 1979. Additional data were provided by the New York State Tumor Registry, the New York University Coordinated Cancer Registry, and the University of California Tumor Registry.

Task-force epidemiologists or officers of the CDC's Epidemic Intelligence Service actively surveyed physicians in 15 major metropolitan areas in the United States by letter and telephone to inquire about Kaposi's sarcoma in persons under 50 years of age or opportunistic infections in patients without a known predisposing factor since January 1979. At a minimum, heads of infectious disease, dermatology, oncology, and pathology departments from all major hospitals in these communities were contacted. In several of the metropolitan areas, physicians who served large numbers of homosexual men were known by the staff of clinics for sexually transmitted diseases or by other healthcare personnel. When we obtained

Curran, M.D. (Coordinator), William W. Darrow, Ph.D., Henry Fisk, M.D., David S. Gordon, M.D., Mary E. Guinan, M.D., Harry W. Haverkos, M.D., Clark A. Heath, Jr., M.D., Rue T. Ing, M.D., Harold W. Jaffe, M.D., Bonnie Milloy Jones, Dennis D. Juranek, D.V.M., Alexander Keiser, M.D., J. Michael Lane, M.D., Dale N. Lawrence, M.D., Richard Ludlam, Carolyn P. McGrath, James M. Monroe, David M. Mirsky, M.D., John P. Dennis, Martha F. Rogers, M.D., William R. Rushing, Richard A. Stein, M.D., Mary Ellen Sweeney, Thomas J. Spira, M.D., June A. Stewart, M.D., Pauline A. Thomas, M.D., and Hilda Wolfe-Lorenzo. Address reprint requests to Dr. Curran at Technical Information Services, Centers for Disease Control, Atlanta, GA 30333.

the names of these physicians, we attempted to contact them as well. In early August 1981, a formal request was made to all state health departments to notify the CDC of illnesses suspected of fitting the case definition. Several of these agencies have begun active surveillance.

Since November 1967, the CDC has been the sole United States supplier of pentamidine isethionate for the therapy of *P. carinii* pneumonia. Although trimethoprim-sulfamethoxazole has replaced pentamidine as the initial therapeutic agent, many patients still require pentamidine therapy. Routinely collected data on the patients' underlying conditions were reviewed from January 1, 1976, to November 10, 1981.

Results

There were 159 documented cases of Kaposi's sarcoma, *P. carinii* pneumonia, and other serious opportunistic infections reported to the CDC between June 1 and November 10, 1981 (Table 1). Sixteen additional cases have been excluded because of possible predisposing illnesses or systemic immunosuppressive therapy. The majority of the cases were detected through follow-up of reports to the CDC and requests for pentamidine or through active surveillance in New York City and California. Active surveillance in 15 metropolitan areas outside New York and California revealed no cases fitting the case definition that had not been reported previously. Searches of available tumor registries in New York, California, and Georgia indicated that Kaposi's sarcoma was an uncommonly reported cancer in these areas, rarely occurring in persons under the age of 50. No increased incidence of Kaposi's sarcoma was noted through 1979. From January 1, 1976, through June 1980 there was one questionable request to the CDC for pentamidine isethionate to treat an adult without an underlying disorder. From July through December 1980, there were nine such requests, all of which are included in this report. At this writing in 1981, 42 requests for pentamidine have been filled for men without underlying disorders. This represents 37 per cent of all the requests for pentamidine for the treatment of adults in the United States in 1981 (42 of 114 requests).

Table 1. Outcome of Cases of Kaposi's Sarcoma, *Pneumocystis carinii* Pneumonia, and Other Serious Opportunistic Infections Reported to the Centers for Disease Control from June 1 to November 10, 1981.

Disease	No. Alive	No. Dead	Total No.	% Dead
Kaposi's sarcoma	62	11	73	15.1
P. carinii pneumonia	24	37	61	60.7
Both	8	7	15	46.7
Other infections	4	6	10	60.0
Total	98	61	159	38.4

The high mortality rate among the patients with *P. carinii* pneumonia accurately reflects the severity of their illness as well as the general debilitation of many of these men. Among 76 men with *P. carinii* pneumonia, 30 (39.5 per cent) died of the initial infection. Of 46 survivors, 13 subsequently died, including four of the eight who had recurrent *P. carinii* pneumonia. The remainder of the subsequent deaths were attributed to Kaposi's sarcoma or to other opportunistic infections. Forty-three of 76 initial episodes of *P. carinii* pneumonia and all eight recurrent episodes required therapy with pentamidine. Among the 15 patients with both Kaposi's sarcoma and *P. carinii* pneumonia, Kaposi's sarcoma was diagnosed first in six, *P. carinii* pneumonia was diagnosed first in six, and the diagnoses were made during the same month in the remaining three. In some patients, the diagnosis of *P. carinii* pneumonia preceded that of Kaposi's sarcoma by six months or longer.

The 10 patients with other serious opportunistic infections included four with progressive or disseminated herpes simplex virus infections, three with toxoplasmosis of the central nervous system, one with cryptococcal meningitis, and two with disseminated cytomegalovirus infection. Over 40 per cent of the remaining 149 patients with Kaposi's sarcoma, *P. carinii* pneumonia, or both were reported to have other serious opportunistic infections, including 10 of 73 patients with Kaposi's sarcoma alone, 42 of 61 with *P. carinii* pneumonia alone, and 12 of 15 with both Kaposi's sarcoma and *P. carinii* pneumonia. Patients with *P. carinii* pneumonia alone were significantly more likely to be reported as having opportunistic infections than were those with Kaposi's sarcoma alone ($P<0.00001$ by Fisher's exact test). These infections include 24 clinically important cytomegalovirus infections confirmed by virus isolation or biopsy, six progressive or disseminated herpes simplex virus infections, five cryptococcal meningitis infections, 12 invasive gastrointestinal candida infections, seven disseminated mycobacterial infections (two with *Mycobacterium tuberculosis* and five with other species), and 10 other infections. These data are incomplete; they reflect only the coexisting infections that were well documented and were reported to the CDC.

Data generated by CDC surveillance indicate a secular increase in the number of reported cases by month of onset, month of confirmed diagnosis, and month of death (Fig. 1). The patients with both Kaposi's sarcoma and *P. carinii* pneumonia are represented in the diagnosis curve according to their first diagnosed illness. A considerable delay occurred between the initial onset of symptoms and diagnosis in both the Kaposi's sarcoma and *P. carinii* pneumonia groups. For Kaposi's sarcoma, the time from the onset of symptoms to diagnosis ranged from one to 30 months (median, 5.5); for *P. carinii* pneumonia, the range was one to 18 months (median, 3.5). Fifty-three per cent of the patients (84 of 159) had the onset of their illness after January 1981, whereas 88 per cent became ill after January 1980. Seventy-five per cent of the cases (119 of 159) were diagnosed during 1981, and 74 per cent of the deaths (45 of 61) occurred during 1981. The decline in the onset curve probably reflects the average three to six-month delay from the onset of symptoms to diagnosis. Late declines in the diagnosis and death curves may represent delay in reports to the CDC.

Figure 1. Incidence of Kaposi's Sarcoma (KS), *Pneumocystis carinii* Pneumonia (PCP), and Other Opportunistic Infections in the United States, 1979–1981.

Table 2 shows selected signs or symptoms in patients with Kaposi's sarcoma, *P. carinii* pneumonia, or both. The frequency of lymphadenopathy, fever, and weight loss in the group with Kaposi's sarcoma attests to the often generalized nature of the disease. In each group, many patients were reported to have had a prodromal illness lasting for weeks to months and characterized by weight loss, lymphadenopathy, fever, and diarrhea. This prodrome was more consistently present and severe in patients with *P. carinii* pneumonia.

All but one of the 159 reported cases occurred in men. Ninety-two per cent of these men (136 of 148) were reported to be homosexual or bisexual when sexual preference was known (Table 3). Patients' ages ranged from 15 to 57 years, with a median of 35. Eighty-two per cent of the men were in the 25 to 44-year-old group. Seventy per cent of the men were white (not Hispanic), 16 per cent Hispanic, and 14 per cent black. There were no significant differences in age or race between the disease categories.

Although cases were reported from 15 states, the District of Columbia, and two foreign countries, over three fourths of the patients were living in New York City, San Francisco, or Los Angeles at the time of diagnosis (Table 4). Since over half the cases were reported from the New York City metropolitan area, we compared the residence of patients whose onset of symptoms was early with that of patients whose symptoms began later in the epidemic. There was no significant difference in residence in metropolitan New York City between patients whose symptoms began before January 1, 1980 (17 of 24, 70.8 per cent), and those whose symptoms began after that date (70 of 135, 51.9 per cent) ($P>0.10$).

Discussion

The current outbreak of Kaposi's sarcoma, *P. carinii* pneumonia, and other opportunistic infections is highly unusual. Kaposi's sarcoma is a rare, malignant neoplasm, predominantly affecting elderly men and seldom causing death.[1] Although precise rates are unavailable, the annual incidence in the United States has been estimated to be 0.021 to 0.061 per 100,000 population.[6,7] In one large series, Safai et al. reported a 3:1 male-to-female ratio and a mean age of 63 years among patients with Kaposi's sarcoma.[8] Precise incidence estimates specific for sexual preference are not available, because the number of homosexual men living in cities where Kaposi's sarcoma has occurred is unknown. Nonetheless, the highly localized occurrence of 88 cases among men under 50 suggests at least a 100-fold increase in age-specific risk among homosexual men in the cities reporting cases, as compared with previous estimates of incidence. Although *P. carinii* causes several hundred cases of severe pneumonia in the United States annually, these cases were previously found almost exclusively in patients whose immunity was severely compromised by underlying disease, immunosuppressive therapy, or both.[9,10] After reviewing requests for pentamidine in the period from 1967 to 1970, when pentamidine was the only recommended treatment for *P. carinii* pneumonia, Walzer et al. discovered only one case of confirmed *P. carinii*

Table 2. Signs or Symptoms Reported in Patients with Kaposi's Sarcoma, *P. carinii* Pneumonia, or Both.

Sign or Symptom	% with Sign or Symptom		
	Kaposi's Sarcoma (n = 77)	*P. carinii* Pneumonia (n = 51)	Both (n = 15)
Skin or mucosal lesions	90.9	9.8	86.7
Lymphadenopathy	49.6	25.5	40.0
Fever	53.0	53.4	86.7
Weight loss	7.2	7.8	93.3
Diarrhea	4.5	14.8	40.0
Dyspnea	5.2	88.2	100.0
Oral thrush	4.5	4.1	26.7

Table 3. Sexual Preference of Men with Kaposi's Sarcoma, *P. carinii* Pneumonia, or Other Serious Opportunistic Infections Reported to the CDC.

Disease	Homosexual or Bisexual	Heterosexual	Unknown	Total
	no. of patients			
Kaposi's sarcoma	66	2	5	73
P. carinii pneumonia	49	9	3	61
Both	15	—	—	15
Other infections	6	1	2	9
Total	136	12	10	158

pneumonia in a patient without a known underlying condition.[7] Our recent review of requests for pentamidine confirms the rarity with which this disease has been previously diagnosed among adults without underlying conditions.

The simultaneous occurrence of Kaposi's sarcoma and *P. carinii* pneumonia among homosexual men of the same age and racial groups who live in the same geographic areas strongly suggests the occurrence of a single epidemic of underlying immunosuppression in these men. As noted previously, *P. carinii* pneumonia is typically a disease of immunocompromised patients. The incidence of Kaposi's sarcoma is greatly increased among recipients of renal allografts[9-12] and others receiving immunosuppressive therapy.[13-15] The natural history of the currently reported cases of Kaposi's sarcoma among these homosexual men is similar to that among transplant recipients, in that it more frequently involves the visceral organs and has a poor prognosis.[12,15a] When Kaposi's sarcoma occurs in allograft recipients, the tumor often spontaneously regresses with cessation or reduction of immunosuppressive therapy.[10,12]

The high mortality rate among young men with these disorders indicates a serious public-health problem. The magnitude of the current epidemic is understated by the data presented on biopsy-confirmed cases of Kaposi's sarcoma and *P. carinii* pneumonia. Young men presenting with interstitial pneumonia without an underlying disorder may not have received a definite diagnosis or specific therapy for *P. carinii* pneumonia; others may have received empirical therapy with trimethoprim-sulfamethoxazole. The rather benign, inconspicuous appearance of many of the skin and mucous-membrane lesions of Kaposi's sarcoma in these men suggests that this disease may also be underdiagnosed.

If immunosuppression is the underlying cause of these conditions, then Kaposi's sarcoma and *P. carinii* pneumonia may represent the "tip of the iceberg" including other conditions that are less readily recognized or have longer latency periods. While investigating this outbreak, we have received numerous physicians' reports on young homosexual men with nonfatal opportunistic infections, unexplained prolonged lymphadenopathy, or lymphoreticular neoplasias. Although sporadic case reports of lymphoreticular neoplasms are difficult to interpret, these reports are a cause for concern, since Safai et al. have noted that Kaposi's sarcoma is frequently associated with other primary tumors.[6] In their series, 37 per cent of the patients with Kaposi's sarcoma had other primary cancers; specifically, the authors noted a 20-fold increase in lymphoreticular neoplasms. Clinicians caring for homosexual men should be alert for signs and symptoms of other infections and neoplasms associated with immunodepression, in addition to Kaposi's sarcoma and *P. carinii* pneumonia.

Although it is possible that the concentration of reported Kaposi's sarcoma, *P. carinii* pneumonia, and other opportunistic infections among homosexual men living in New York and California represents a reporting art fact, we consider this possibility unlikely. Most of the reported cases were from tertiary-care facilities — the same type of facility included in our survey of 18 cities. If the geographic clustering of cases is in fact real, it suggests that risk factors for these diseases are not randomly distributed in the homosexual community.

Giraldo et al. first suggested an association between Kaposi's sarcoma and cytomegalovirus infection when they isolated cytomegalovirus from one of eight tissue-culture cell lines from patients with Kaposi's sarcoma.[16] They subsequently demonstrated a serologic association of Kaposi's sarcoma with cytomegalovirus in American and European patients, but not in African patients.[17,18] Finally, they found that three of eight tumor-biopsy samples were positive for cytomegalovirus DNA by DNA-DNA reassociation kinetics.[19] Cytomegalovirus is often associated with *P. carinii* pneumonia in immunosuppressed hosts, especially among renal-transplant recipients.[20] Furthermore, cytomegalovirus induces transient abnormalities in cellular immune function in otherwise healthy persons.[21] Since serologic evidence of cytomegalovirus infection and active shedding of cytomegalovirus in the urine have been shown to be more common among homosexual men than among heterosexual men of the same age,[22] further investigation of cytomegalovirus in the cases reported here is important. On the other hand, cytomegalovirus infection is very common in the United States and has not been

Table 4. Metropolitan Area of Residence at the Time of Diagnosis in Patients with Kaposi's Sarcoma, *P. carinii* Pneumonia, or Other Serious Opportunistic Infections.

Disease	New York City	San Francisco	Los Angeles	Other	Total
	no. of patients				
Kaposi's sarcoma	40	12	4	[illegible]	73
P. carinii pneumonia	34	5	[illegible]	[illegible]	61
Both	7	2	[illegible]	4	15
Other infections	6	0	[illegible]	[illegible]	10
Total	87	19	[illegible]	[illegible]	159

shown to have such devastating effects on other populations. Since reactivation of cytomegalovirus is common among immunocompromised hosts, the role of this virus will not be easily defined in this outbreak.

In a recently published study, Masur et al. described 11 cases of *P. carinii* pneumonia in immunocompromised men without underlying disorders or therapy.[22] Although six of these men were homosexual, five others were reported to be drug abusers (using heroin, methadone, alcohol, or cocaine). Opiate addiction has been associated with alterations in cellular immune status in vitro,[24,25] but it had not previously been associated with *P. carinii* pneumonia.

The interest in a causal role for inhalants containing amyl nitrite or isobutyl nitrite or both ("poppers," as they are commonly called) stems from the hypothesis that they are used as sexual stimulants or recreational drugs by some homosexual men. In a recent survey of 420 men attending clinics for sexually transmitted diseases in New York, San Francisco, and Atlanta, we found that 86.4 per cent of homosexual and bisexual men (242 of 279), as compared with 14.9 per cent of heterosexual men (21 of 141), reported the use of nitrite inhalants within five years. However, the frequency of nitrite use was closely correlated with the number of sexual partners reported during the previous month. This suggests that the use of nitrites may be associated with other hypothetical etiologic factors, such as sexually transmitted infections, antimicrobial agents for treatment or prevention of these infections, types of sexual behavior, attendance at places where partners are encountered, and perhaps the use of other drugs. Studies undertaken to determine what role (if any) nitrites may have as risk factors for Kaposi's sarcoma and *P. carinii* pneumonia and immunosuppression must carefully consider the confounding effects of these other variables.

In collaboration with investigators in New York, California, and Georgia, the CDC task force is completing a national case-control study to identify risk factors for Kaposi's sarcoma and *P. carinii* pneumonia among homosexual men. We are continuing surveillance for these disorders and conducting other clinical and laboratory investigations.

This sudden, highly focal occurrence of Kaposi's sarcoma and *P. carinii* pneumonia provides an opportunity to investigate the relations among life style, environment, host immune responses, and oncogenesis and suggests the potential for prevention of these diseases if risk factors can be identified.

Note added in proof: Between November 10, 1981, and January 13, 1982, 57 additional cases were reported, bringing the total to 216 (89 cases of Kaposi's sarcoma, 91 of *P. carinii* pneumonia, 18 of both, and 18 of other infections). At least 88 (40.8 per cent) of these patients have died.

We are indebted to the physicians reporting cases and to Drs. Donald F. Austin, Erwin Braff, James W. Buehler, James Chin, J. Lyle Conrad, Selma Dritz, Diane M. Dover, Shirley L. Fannin, Yehudi M. Felman, Stephen M. Friedman, Robert A. Gunn, John P. Hanrahan, Robert J. Kingon, Michael D. Mattson, Stanley L. Music, Mark A. Roberts, Alain J. Rosin, Richard B. Rothenberg, and R. Keith Sikes for their roles in active surveillance.

AN OUTBREAK OF LEGIONNAIRES' DISEASE ASSOCIATED WITH A CONTAMINATED AIR-CONDITIONING COOLING TOWER

TIMOTHY J. DONDERO, JR., M.D., ROBERT C. RENDTORFF, M.D., GEORGE F. MALLISON, M.P.H., R. MARK WEEKS, M.P.H., JOE S. LEVY, M.D., EDWARD W. WONG, M.D., AND WILLIAM SCHAFFNER, M.D.

Abstract In August and September 1978, an outbreak of Legionnaires' disease occurred in Memphis, Tennessee. Of the 44 ill, 39 had been either patients, employees, visitors, or passers-by at one Memphis hospital (Hospital A) during the 10 days before. Assuming an incubation period of between two and 10 days, the onset of cases correlated precisely with the use of Hospital A's auxiliary air-conditioning cooling tower. *L. pneumophila* was recovered from two samples of water from the tower.

Infection appeared to have occurred both outside and within the hospital. A significant association was demonstrated between acquisition of Legionnaires' disease and prior hospitalization in those areas of Hospital A that received ventilating air from air intakes near the auxiliary cooling tower. Tracer-smoke studies indicated that contaminated aerosols from the tower could easily reach these air intakes, as well as the street below, where four passers-by had been before they contracted Legionnaires' disease.

This represents a common-source outbreak in which the source of *L. pneumophila* infection and airborne transmission were identified. (N Engl J Med 302:365-370, 1980)

SINCE the dramatic summer of 1976, when Legionnaires' disease was first recognized,[1,2] investigators have attempted to discover an environmental source of the causative bacillus and to elucidate the agent's mode of transmission. During an epidemic investigation in Bloomington, Indiana, in mid-1978, the agent was recovered from water in an air-conditioning cooling tower and a nearby stream.[3] However, because the air-cooling system was not in operation during parts of the outbreak, these isolates could not be epidemiologically related to the cases.

In August and September 1978, an outbreak of Legionnaires' disease occurred in Memphis, Tennessee, that was focused on one hospital. The ensuing investigation revealed the source of the agent to be a contaminated air-conditioning cooling tower and associated this source with the occurrence of disease.

BACKGROUND

Memphis–Shelby County has a population of 750,000. Until the outbreak, Legionnaires' disease had not been confirmed in the city or elsewhere in west Tennessee, despite its endemicity in other parts of the state (Tennessee Department of Public Health: unpublished data).

The city is served by eight hospitals. Hospital A is an acute-care complex in central Memphis comprising three connected buildings. The facility has 1730 beds and a staff of 4790. Occupancy during August and September 1978 averaged 82 per cent, with a mean patient stay of 8.8 days; most patients are older than 15 years of age. The hospital receives countless visitors daily; a number remain overnight in patient rooms and waiting areas.

After heavy rains on August 8, 1978, a flash flood inundated central Memphis, including the ground floor of Hospital A (other hospitals were not involved). Patient-care areas were not affected, and the water was cleaned up within hours. However, pumps for the main cooling towers were inactivated, causing a temporary loss of air-conditioning. An auxiliary cooling tower, not operated for nearly two years, was used from August 8 until September 7, when the main units were fully restored. Unlike the main units, this recently filled tower had inadvertently not received chemical treatment of its water. There had been no recent renovations, construction, or earth-moving in the vicinity of the hospital.

METHODS

Diagnosis and Case Finding

A working clinical definition of suspected Legionnaires' disease incorporated three criteria: temperature of 39.2°C or higher, radiographic evidence of pneumonia, and no bacterial isolate of convincing clinical importance.

The diagnosis was confirmed by a fourfold or greater rise in indirect fluorescent antibody (IFA) titer to 128 or higher.[4] Tests were performed (either at Baptist Memorial Hospital in Memphis or at Tennessee State Public Health Laboratory in Nashville) using Philadelphia 1 (serogroup 1) antigen provided by the Center for Disease Control (CDC), Atlanta, Georgia. (Post-mortem tissue samples were sent to CDC for direct fluorescent antibody staining[4] but did not identify any further cases.) When no acute-phase serum specimen was available, a presumptive diagnosis of Legionnaires' disease was made on the basis of a convalescent-phase IFA titer of 256 or more in cases that were clinically consistent. Also, when no acute-phase serum was available, a case was considered suggestive if it fully met the clinical case definition and has a convalescent-phase IFA titer of 128.

Prospective surveillance for patients meeting the clinical criteria was established in early September at all eight Memphis hospitals and was continued until mid-October. Intensive retrospective casefinding was conducted through review of admissions and medical records from July through September at Hospital A and at two large hospitals nearby.

When possible, acute and convalescent-phase serum specimens or post-mortem lung tissue were tested from all patients meeting

From the Field Services Division and the Bacterial Diseases Division, Bureau of Epidemiology, Center for Disease Control, Atlanta; the Department of Preventive Medicine, University of Tennessee School of Medicine, Memphis; the Tennessee Department of Public Health; the Memphis-Shelby County Health Department; and the Vanderbilt University School of Medicine, Nashville (address reprint requests to Dr. ~~Dondero at~~ the Bureau of Epidemiology, Center for Disease Control, Atlanta, GA 30333).

This manuscript shared the 1979 Alexander D. Langmuir Prize for epidemiology, which is awarded annually by the Epidemic Intelligence Service Alumni Association of the Center for Disease Control.

the clinical case definition; Hospital A patients with milder pneumonia or fever of unknown cause from August through October; and Hospital A employees who had been on sick leave at least three days in August or September with fever or respiratory disease. A total of 76 persons meeting the clinical definition of Legionnaires' disease and over 75 persons with milder illness were examined. Finally, all confirmed cases occurring from July through October 1978 that were reported to the Tennessee Department of Public Health were investigated for any Memphis association.

Surveys and Studies

Patients or knowledgeable relatives (rarely only the physician and medical charts) were interviewed concerning their exposure to flood water and their geographic, occupational, and social activities during the two weeks before onset of illness. Particular attention was paid to associations with any Memphis hospital; in these cases, information was sought regarding areas and rooms visited or stayed in, entrances used, frequency of visits, duration, dates, and the like. Medical records were examined to confirm any hospital associations.

Three case-control studies were conducted.

The first study (Study 1) was performed to determine whether exposure to Hospital A or any other hospital during the 10 days before the onset of illness was associated with risk of Legionnaires' disease. For those patients admitted to a hospital after Legionnaires' disease developed, the next age-matched (±5 years) and sex-matched admission to the same hospital was selected as the control. For those cases where Legionnaires' disease developed in a patient already hospitalized for another illness (only found at Hospital A), a sex-matched and age-matched patient control was selected randomly from the hospital census on the date of onset of Legionnaires' disease, and associations were sought that existed at least two days previously, i.e., before the apparent minimum incubation period of Legionnaires' disease.[1] Findings were compared by McNemar matched-pair analysis.

Two further case-control studies focused on the subset of patients with Legionnaires' disease who had been in Hospital A for another illness at some time during the 10 days before the onset of Legionnaires' disease. In both studies, controls were inpatients at least 15 years old and without pneumonia, admitted on the same day as the respective patient with Legionnaires' disease on his most recent admission before onset of Legionnaires' disease. Data in both studies were analyzed by the Mann–Whitney U test or by the Pike and Morrow modification of the Mantel–Haenszel test for multiple matched controls.[3]

In Study 2, which examined a variety of personal risk factors, four controls were chosen per case, were matched only for time of admission, and comprised the two patients admitted immediately before, and the two immediately after, the case. Factors examined included age, sex, room and building where hospitalized, and dates and duration of hospitalization.

Study 3 focused on underlying disease and precise area of hospitalization. Two controls were drawn for each case, the nearest preceding and succeeding admissions matched for sex, age (±5 years), and building where hospitalized. Risk factors examined included race, history of chronic lung disease, cancer and certain other diseases, immunosuppression, hospital room, and dates and duration of hospitalization.

A preliminary examination of Hospital A's cooling towers was performed by R. T. Kelly, M.D., of Baptist Memorial Hospital, Memphis, who, with W. A. Rightsel, Ph.D., inoculated guinea pigs with water from the auxiliary cooling tower. A detailed engineering and environmental examination of the hospital was conducted by one of us (G.F.M.). Air currents around the hospital complex were analyzed by tracer-smoke studies. Samples of water and organic matter from the cooling towers and ventilation systems were collected and analyzed at CDC for the Legionnaires' disease agent.[4] Samples from cooling towers at two sites not associated with Legionnaires' disease (Hospital B 3 km southeast and the local health department 2 km northwest) were similarly processed.

Results

Forty-seven cases of Legionnaires' disease were found that related to Memphis–Shelby County between June and October 1978; 23 of these were confirmed, 18 were presumptive, and six were suggestive. Seven patients died, including two confirmed, three presumptive, and two suggestive. Clinically, the disease was of the severe type observed in Philadelphia in 1976,[1] with pneumonia demonstrated in 96 percent and temperature of 39.2°C or higher in 89 percent.

The epidemic curve (Fig. 1) shows a marked clustering of 44 cases in August and September. The distribution of suggestive cases paralleled that of the more securely diagnosed.

Implication of Hospital A

Forty-seven patients with Legionnaires' disease who had some Memphis association between June and October were found at 13 hospitals in Tennessee and Mississippi. Thirty-nine patients (85 per cent) had an association with Hospital A during the 10 days before onset of their illness: 16 as patients (three continuously for over two weeks before onset); eight as employees; 11 as visitors (five regularly stayed overnight); and four as passers-by on an adjacent street but not actually in the hospital. Only eight Memphis-associated patients between June and October had had no recent previous association with the hospital, and three of these became ill outside the epidemic months of August and September (Fig. 1). There was no association found with exposure to any other Memphis hospital or with direct exposure to flood-water.

Of the August-September patients with Legionnaires' disease, 24 of 44 had been either employed or a patient at Hospital A before onset. This incidence was significantly greater than that of the Study 1 controls: seven of 44 (chi-square = 13.76 by matched-pair analysis; $P<0.001$). Relative risk was estimated as 9.5 (11 for previous hospitalization, 8 for employment). Estimated differential attack rates are presented in Table 1.

Implication of the Auxiliary Cooling Tower

As shown in Figure 1, hospital-associated cases had onsets of illness that clustered between mid-August and mid-September. Non-associated cases extended from June to October; these were more frequently identified during and at the end of the epidemic period and probably reflected heightened medical awareness. The occurrence of hospital-associated cases corresponds precisely with the use of Hospital A's auxiliary air-conditioning cooling tower, assuming an incubation period of two to 10 days.[1] All 39 Hospital A-related patients with Legionnaires' disease had been in or near the hospital while the cooling tower was in use. All had onsets between the dates that would be predicted — August 10 to September 17.

Figure 1. Cases of Legionnaires' Disease by Date of Onset and by Association with Hospital A.

— if the cooling tower were directly associated with transmission of Legionnaires' disease; in contrast, only three of the eight non-hospital-associated cases had onset of Legionnaires' disease during this period ($P<0.000001$ by Fisher's exact one-tailed test).

Shortly after the outbreak, water from the auxiliary cooling tower was found by guinea-pig inoculation to contain *Legionella pneumophila* serogroup 1. The recovery was first performed in the Baptist Memorial Hospital microbiology laboratory and was confirmed with a subsequent water sample processed at the CDC. One control specimen from a cooling tower on Hospital B, which was not associated either with the outbreak or with "sporadic" cases, was also positive both for serogroup 1 and for a non-typable serogroup. Specimens from the other control site were negative.

The auxiliary cooling tower was located on the eastern side of Hospital A (Fig. 2) at the second-story level. Water in the cooling tower had no direct connection with air in the ventilating systems. However, in normal operation the tower released a forceful aerosol ("drift") of its warm water into the surrounding atmosphere.

Table 1. Estimated Attack Rates for Legionnaires' Disease, according to Nature of Association with Hospital A during Outbreak Period (August 11–September 21, 1978).

Association	Number of Persons at Risk	Number of Cases	Attack Rate (per 1,000 at risk)
Employee	4,790	8	1.7

Memphis–Shelby County, not hospital-associated	750,000§	5	<0.01

*Derived from census and admissions records.
†Mean of 262 visitor cots signed out per night + 10% estimated with own cot + 30 visitors) × 41 days ÷ 5.5 days mean patient stay.
‡Estimated as five visitors per patient.
§1975 Census estimate for Memphis–Shelby County.

Environmental examination of the hospital revealed a complex network of noncommunicating ventilation systems that provided cooled air to separate parts of the hospital's three buildings. Outside air was drawn in through large intakes located on various parts of the hospital. It was then filtered, cooled as it passed over pipes containing refrigerant (which itself transferred heat to water from the cooling tower), and was forced into the particular rooms, corridors, or nursing stations for which it was destined. After circulation within a room or corridor, air entered an exhaust vent there, passed through the exhaust system and was released to the outside. Because vents and intakes were properly located, exhausted air did not recirculate into the building. Thus, air from a particular intake reached specific interior areas and, aside from some air mixing through doorways, constituted the major proportion of ventilating air for those places.

Figure 2. Schematic Diagram of Hospital A.
Black arrows indicate air intakes near cooling tower; white arrows indicate remote air intakes.

Table 2. Differential Attack Rates for Legionnaires' Disease, According to Building Where Patients Were Hospitalized before Onset and Source of Ventilating Air.

Building	Source of Ventilating Air	Number of Cases	Bed-Months at Risk*	Attack Rate (per 100 bed-months)
South	Top	2	259	0.8
	West	1	510	0.2
West	West	1	283	0.4
North	Top	3	311	1.0
	North	1	81	1.2
	East †	8	288	2.8 ‡

*During period of use of auxiliary cooling tower, Aug. 8–Sept. 7, 1978.

†Air intakes face auxiliary cooling tower.

‡Significantly higher than rate for other areas combined (chi-square = 10.61; P<0.01).

On certain floors of the north building as many as three separate external air supplies reached three different groups of rooms or corridors.

As shown in Figure 2, most of the air intakes at the hospital were on the north, west, south, or top of the 19-story complex, away from and shielded by the building from the auxiliary cooling tower. However, two intakes (black arrows), which gathered air for certain patient rooms on eight floors in the north building, were located 3½ stories high on the eastern side of the hospital, only 15 meters from the tower and about one-half story above its top. Tracer smoke released at the cooling tower (no longer in operation) hovered on the eastern side of the building directly by the two intakes, rose partway up the building, and gradually dissipated across and along A Street, not visibly reaching the hospital's other air intakes. Thus, several areas in and near the hospital seemed most likely to be exposed to aerosols from the cooling tower: those rooms in the north building supplied by the two eastward-facing air intakes, the main hospital entrance on A Street, and A Street itself.

Four patients with Legionnaires' disease had been on A Street immediately outside the hospital during the 10 days before onset of their illness, but not actually in the building. Most hospital employees or visitors in whom the disease developed had walked on A Street and used the entrance there. Within the hospital they walked through many parts of the complex. The principal place of work or visiting, however, was the north building for eight persons, the south building for eight, both buildings for two and the west building for one.

The patients who were hospitalized for other reasons before onset of Legionnaires' disease had been much less mobile and were better sentinels in the search for high-risk areas of the hospital. Patient areas were grouped according to the intake location of their ventilating air. Table 2 presents the air source-specific attack rates. The north building, the only building that received some ventilating air from the air intakes near the auxiliary cooling tower, had a significantly higher attack rate than did the other two buildings combined (chi-square = 7.16; P<0.01). The attack rate for those specific rooms within the north building that were ventilated with air from near the auxiliary cooling tower was significantly higher than the rate for the other areas of the hospital (chi-square = 10.61; P<0.01).

These rooms were also implicated by case-control Study 2 (Table 3). Patients with Legionnaires' disease were significantly more likely than controls to have been hospitalized in the north building before onset, particularly in those rooms receiving air from near the auxiliary cooling tower. In case-control Study 3 (Table 3), eight of the 12 patients with Legionnaires' disease (67 per cent) from the north building had been in rooms ventilated from near the cooling tower, as compared with seven of 24 (29 per cent) for the matched controls who had been hospitalized in the same building. Although the small numbers preclude the achievement of statistical significance by the rigorous multiple matched-control analysis, the data are consistent with the previous results.

Greater length of hospitalization before onset of Legionnaires' disease also was a significant risk factor

Table 3. Area of Hospitalization before Onset of Legionnaires' Disease — Comparison of Cases with Two Control Groups.

Source of Data	North Building		Other Buildings		Room Receiving Air from Near Auxiliary Tower		Room Receiving Air from Other Sources		Estimated Relative Risk	Significance*	
	Cases	Controls	Cases	Controls	Cases	Controls	Cases	Controls		Chi-square	P value
Case-control Study 2†	12	27	4	37					4.1	11.34	0.001
Case-control Study 2†					8	11	3	53	4.8	6.48	0.01
Case-control Study 3‡					8	7	4	17	4.9	3.02	0.08

*Pooled data presented for summary purposes; analysis performed by Mantel–Haenszel test for multiple matched controls.

†Four controls per case, matched only for time of original admission.

‡Two controls per case, matched for time of original admission, age ±5 years, sex, and building where hospitalized; comparison of cases and controls from north building only.

In Study 2, mean hospital stay before onset was 18.2 days for cases, whereas mean total stay for controls was 6.9 days ($P<0.0001$ by the Mann–Whitney U test). Mean stay in hospital while the auxiliary cooling tower was in use was 12.3 days for cases but only 4.6 days for controls ($P = 0.0003$). The differences remained significant in Study 3, where controls were matched for age and sex, as well as building where hospitalized: 18.2 days' mean stay before onset for cases and 9.2 days for controls ($P = 0.004$); 12.3 days during use of the auxiliary cooling tower for cases and 6.3 days for controls ($P = 0.013$).

Other Possible Risk Factors

Hospitalization-associated patients with Legionnaires' disease ranged from 24 to 82 years of age (mean, 57.9), as compared to 47.6 for controls in Study 2 — a difference of borderline significance ($P = 0.054$ by Mann–Whitney U test). Among the hospitalization-associated cases there were 11 men and five women, as compared with 28 men and 36 women for controls in Study 2 — a significant difference (chi square = 4.75 by the Mantel–Haenszel test; $P = 0.03$). In other studies, controls were matched for age and sex. Race was not found to be associated.

There were no significant differences between cases and controls in Study 3 for history of chronic lung disease, cancer, arteriosclerotic cardiovascular disease, diabetes mellitus, or immunosuppression therapy.

Incubation Period

Four patients with Legionnaires' disease had only a single exposure to Hospital A, suggesting incubation periods of four days, five days, and seven days (two patients). If exposure is considered only during the period of use of the auxiliary cooling tower, all hospital-associated cases could be explained by an incubation period of three to nine days, consistent with the range found in Philadelphia.[1]

Discussion

This was a clear-cut outbreak of Legionnaires' disease, brief but intense, narrowly confined to one geographic point in a city recognized to have a low background endemicity. Transmission appeared to have taken place both inside and immediately outside Hospital A and was limited to the period when an auxiliary cooling tower was in use. The only identified exposure history that was shared by the various hospital-associated cases was physical presence in or near the hospital and breathing the air. The temporally implicated cooling tower produced an aerosol of water that twice was shown to harbor *L. pneumophila*. A tracer-smoke study demonstrated that aerosols from the cooling tower could reach two nearby air intakes and the street below. There were cases associated with that portion of the street; and within the hospital, those areas ventilated with air from near the cooling tower were specifically linked with acquisition of Legionnaires' disease.

The epidemiologic and microbiologic findings therefore implicate the auxiliary cooling tower as the source of the agent, and strongly suggest an airborne mode of spread. A smaller outbreak at a country club in Atlanta[7] has since been associated with a contaminated evaporative condenser, which is similar to a cooling tower. The Memphis findings are reminiscent of the contaminated ventilating system linked to the transmission in 1968 of Pontiac fever, another form of legionellosis,[8] although many epidemiologic and clinical features differ.

How did the auxiliary cooling tower become contaminated, and what was the ultimate source, or reservoir, of the agent? The ecology of *L. pneumophila* is still obscure. It has, however, been isolated with increasing frequency from thermally polluted water in cooling towers,[1,8,9,10] evaporative condensers,[7-10] and from streams and mud.[8,9,10] Many of these sites, like our positive finding at control Hospital B, have not been associated with recognized illness. The organism may indeed be ubiquitous, emphasizing the importance of epidemiologic, as well as environmental, investigation.

Whatever its reservoir, *L. pneumophila* may be able to contaminate a cooling tower by the airborne route. Huge volumes of outside air are drawn through the tower and have intimate contact with the water therein to effect heat exchange.[11] Dust and other particulates are transferred from the air to water; in effect, the incoming air is "washed." It seems reasonable that airborne microorganisms could thus be introduced into the tower. Moreover, cooling towers are open structures, exposed to the droppings and detritus of insects, birds, and possibly other animals. Whether *L. pneumophila*, once introduced, actually can propagate in a cooling tower or simply collects there remains unclear. Presumably, however, it can at least survive in a cooling tower, because it remains viable as long as a year in tap water.[12] The powerful aerosol created as a byproduct of tower operation would seem a capable means of polluting the local atmosphere with microbial contaminants of cooling-tower water. In most of these respects evaporative condensers are similar.[11]

Regardless of how the agent was introduced, the implicated tower at Hospital A was probably contaminated before operation, because hospital-associated cases appeared promptly within three days of its being turned on. The tower had been kept "drained" until one week before use (it had been filled for anticipated flushing of the equipment). However, it communicated with an extensive network of pipes and tubing deep within the building, in which some water remained.

The implication of a contaminated cooling tower as a common point-source and the association of evaporative condensers with two other legionellosis outbreaks[7,8] raise the intriguing question of the role of thermally polluted, aerosol-producing equipment in both legionellosis outbreaks and sporadic cases. Such equipment would seem well suited as amplifying systems for the organism, if not the actual reservoirs. Cooling towers and evaporative condensers are common around commercial and institutional buildings. Their exhausts and aerosols focally infiltrate the breathing air of most urban and industrial areas during warm weather. Their increased and almost universal use in the past several decades corresponds roughly with the recognition of outbreaks of legionellosis, both Legionnaires' disease and Pontiac fever, since the 1960's. Moreover, the seasonal pattern of their use — maximal in midsummer to late summer — corresponds with the seasonality of sporadic cases of legionellosis[13] and with the timing of nearly all the recognized outbreaks. Heat-exchange equipment, however, probably does not constitute the only source of infection. Sporadic cases have occurred throughout the winter months, though with decreased frequency,[12] and in at least one outbreak in this country there apparently was no air conditioning in the vicinity.[14]

Inadvertently, and perhaps serendipitously, the water in Hospital A's auxiliary cooling tower was not subjected to routine chemical treatment. Conventional treatment at the time was for industrial convenience — protection against corrosion and against clogging by algae, slime, and other nuisance microorganisms. Some biocides may have the unanticipated benefit of suppressing *L. pneumophila*, suggesting a means of prevention and control. If demonstrated effective against the agent of Legionnaires' disease, some of these compounds may become part of prudent management of aerosol-producing equipment.[15]

Many persons participated and assisted in the investigation. We acknowledge the contributions of R. T. Kelly, W. A. Rightsel, F. H. Portera, K. F. Hood, T. P. Smith, C. N. Lee, B. J. Thomas, S. Sturdevant, and the medical, nursing, serology, microbiology, engineering and medical-records staffs, and administration of the Baptist Memorial Hospital, Memphis; the infection-control personnel at the Methodist Hospitals, the City of Memphis Hospital, the St. Joseph's Hospitals, and the Veterans Administration Hospital, Memphis; G. S. Lovejoy, Z. Boyle, and the Environmental Section, Memphis–Shelby County Health Department; S. Eakin, J. H. Grayson, and the Serology Laboratory, Tennessee Department of Public Health; G. K. Morris, P. Skaliy, and the Epidemiological Investigations Laboratory Branch Bacterial Diseases Division, Bureau of Epidemiology, Center for Disease Control, Atlanta, Ga. Finally, we wish to thank R. H. Hutcheson, Jr., of the Tennessee Department of Public Health, and the following persons from the Center for Disease Control, for their help: A. W. Hightower, S. M. Martin, J. R. Allen, R. E. Dixon, C. V. Broome, S. I. Music, J. L. Conrad, and D. W. Fraser.

Mr. ROE. Please proceed.

TESTIMONY OF PRISCILLA A. CHAPMAN, NEW ENGLAND CHAPTER, SIERRA CLUB; AND MARIAN K. AGNEW, PRESIDENT, THE CENTER FOR ENVIRONMENTAL STRATEGY

Mr. ROE. We do want to welcome both of you to our committee. Suppose we start out with Ms. Chapman?

Ms. CHAPMAN. Thank you very much, Mr. Chairman.

Mr. Chairman, members of the subcommittee, I am Priscilla Chapman, I'm the executive director of the New England chapter of the Sierra Club. Our chapter office is located in Boston, Mass.

On behalf of the New England Sierra Club, I wish to express strong and enthusiastic support for Representative Howard's bill, H. R. 3282, to reauthorize the Federal Water Pollution Control Act.

I'm speaking for over 13,000 Sierra Club members in our chapter's area who want to see the progress which has already been made in cleaning up our Nation's waterways vigorously continued until the act's stated goals have been achieved.

While progress has been made in restoring water quality in New England, there is yet a considerable way to go. As of January 1980, according to the 1982 report of the region 1 EPA Administrator, 67 percent of our major stream areas met the fishable-swimmable goals of the Clean Water Act.

EPA region 1 projects that 82 percent will have met that deadline by the end of this year.

In Massachusetts, in 1980, 45 percent of our 1,715 river miles had met the standards; and region 1 predicts that 60 percent may be cleaned up by the 1983 deadline.

I happen to live near the shores of one of the rivers in southeastern Massachusetts that's in the 40 percent that is not going to make it; so it's very important to me.

Failures to meet the goals in certain areas are accounted for by problems of combined sewer overflows, runoff from streets, industrial areas, farms, and construction sites, delays in bringing treatment plans online, and concentrations of toxics in bottom sediments.

The New England chapter would like to emphasize four areas in particular where it is crucial that the Clean Water Act be maintained or strengthened—at least maintained—in order to continue the progress we have already made.

The first area that I want to highlight is our opposition to the substitution of opt-out pretreatment programs for the requirements to meet Federal pretreatment standards.

Since Mr. Garabedian already went into a great deal of detail on this point, I'm not going to talk about this at any great length.

I do want to simply point out that Massachusetts, as you probably know, is dealing with the provisions of proposition 2½ which puts certain limitations on the budgets of cities and towns.

Therefore, many of our industrialized towns and cities do not have the capability of formulating standards for all the toxic substances which are being discharged into their municipal sewers.

In fact, several communities in Massachusetts have been experiencing problems with the operation of their treatment plants; and

these problems are known or at least strongly suspected to be caused by industrial toxic pollutants and effluent entering the plants.

A good example of this is on the north shore of Massachusetts, the South Essex sewage district plant, which discharges into Salem Harbor, has been having great problems caused by the effluent containing chromium. In fact, this problem led to a shutdown of the plant and for a considerable period of time this plant was bypassing the sewage, and untreated sewage was being discharged in large quantity into Salem Harbor.

You are probably familiar with the great problems of pollution in Boston Harbor and a large portion of these problems are accounted for, also, by toxics from untreated industrial discharges being discharged into that body of water.

A number of communities are trying to deal with the sludge disposal problems that are created if toxics are not removed to acceptable levels.

For all these reasons we believe that strong pretreatment programs are clearly needed, and they should not be abandoned to the uncertainties of limited municipal personnel and constricted local budgets and pressures from local industries on cities who set up lax programs.

We also don't want to see the delays which are likely to result when cities are just going through the application procedure for opt out.

No. 2, we support the provision in H.R. 3282 which requires the EPA Administrator to identify and develop specific control strategies for toxic hotspots in nonattainment areas.

In my written testimony I refer to one area in particular, the Narragansett Bay in Rhode Island, that has already had a significant amount of activity on the part of Rhode Island and the Governor's task force, which recommended that their regulations for installing toxic systems be strengthened; and that has been done.

They also have a State regional sewer authority which has been trying to clean up the Narragansett Bay, among other things.

Despite these actions, the Narragansett Bay still remains a very large problem because it is a toxic hotspot, and we believe the provisions of Representative Howard's bill would apply to this situation.

No. 3, the chapter enthusiastically endorses the proposed amendments in H.R. 3282 to the 301(h) waiver requirements which would require primary treatment and pretreatment of toxics equivalent to levels of secondary treatment before granting waivers from secondary treatment.

These amendments would also prohibit waivers for discharge into estuarine waters.

These provisions would have specific application to a number of situations in Massachusetts which the New England Sierra Club has been looking into.

A few years ago we opposed the waiver application for Boston Harbor, which was submitted by the Metropolitan District Commission; and we are now studying with great concern similar applications submitted by Lynn, South Essex, New Bedford, and Fall River.

Based on the information found in these applications, it appears that all of those proposed waivers, if granted, would have potentially significant adverse effect on water quality in the respective estuarine areas.

It would also have significant adverse effect on populations of shellfish, fish, and other aquatic life.

These effects would primarily result from unacceptable levels of dissolved oxygen in the effluent and also toxic constituents in the discharge.

In the case of the waiver application for Boston Harbor, Sierra Club also has serious questions about the information which was presented on tidal flows and current movements, and the conclusions that were drawn from this information, about the probable mixing of the effluent in the receiving waters, and probable concentrations of pollutants in the bottom sediments.

We have also raised questions about the MDC's inadequate consideration of the effects of this waiver on Cape Cod Bay.

Requiring Boston and other communities mentioned above to comply with the provisions of the amendments proposed to the 301(h) waivers would result in these communities extending their outfalls beyond the bay areas, to areas where greater degrees of mixing of discharged pollutants would be expected to occur in order for these municipalities to obtain waivers.

Such extensions would be likely to increase the potential of bioconcentration and sediment buildup. In addition, because these municipalities would be required to satisfy strict primary treatment standards, pretreatment equivalent to the toxic removal of secondary, there would likely be a decrease in the levels of toxic and other pollutants in the effluent.

Thus, waivers of secondary treatment might prove in most cases environmentally acceptable.

Savings to these municipalities are still likely to result. The National Wildlife Federation has estimated that the cost of extending their outfall beyond the bay line would be around $140 million. This would be significantly less than the projected capital and operation and maintenance costs of building a secondary treatment plant.

Our last point, No. 4, the New England Sierra Club urges the subcommittee's serious consideration of the problems of pollution from nonpoint sources.

We support Representative Oberstar's proposed amendment to address these problems, but would like to suggest some additional provisions.

Increased control and elimination of point-source discharges under the provisions of the Clean Water Act have made it possible to identify, characterize, and quantify pollution from nonpoint sources.

Under sections 208 and 304(b) of the Clean Water Act, States have performed inventories of nonpoint pollution and some States have described control strategies.

In fact some of these analyses have been completed in great detail. What is still lacking, however, is an across-the-board requirement for States to implement these plans.

A 1977 report by the Massachusetts Division of Water Pollution Control on nonpoint source pollution described the types of pollution entering each river basin in our State, and it demonstrated a wide range of sources, from agricultural runoff, landfill leechate, pesticides, and erosion from forest and construction sites, to septic seepage, runoff of oil and road salt, urban industrial site runoff, and also many problems with combined sewer overlfows, particularly in our cities which have very old water and sewer systems.

More recent reports have been able to quantify the amount of pollution resulting from nonpoint sources.

For example, a recent study of the stretch of the Housatonic River near Pittsfield, Mass., was able to demonstrate how river pollution resulting from runoff can be measured by subtracting the pollutant load measured at the discharge point of local industrial sources from the total load measured downstream in the receiving waters.

Some of the projects generated under the national urban runoff program have shown that nonpoint source pollution control for urban areas need not be expensive propositions, particularly if control strategies such as catch basins, grass covers, and street sweeping are utilized in targeted areas of a city where the largest amount and the most harmful forms of runoff could be expected to occur.

Other studies have examined problems of combined sewer overflows and have suggested that better maintenance of sewer systems and certain kinds of repairs are likely to result in the decrease of sewer overflow, without necessarily spending the huge sums of money that would be necessary to replace the entire systems.

Characterization of these problems and identification of strategies, however, have not necessarily resulted in solutions.

Just this last January the Massachusetts Division of Water Pollution Control completed development of the ground water program based on their 208 findings; and this plan called for specific actions by the State. However, at this point this program seems to have been put on the back burner for lack of funding and for lack of a mandate which the States must go forward with.

Also one of the projects under the national urban runoff program has concluded that urban runoff is a major contributor to the problems in Boston Harbor. Once again, the project provided specific recommendations; but these recommendations have been neither funded nor implemented.

Restrictions on State and municipal budgets have diverted funding and personnel away from areas where control action is not mandated.

My own State's lack of a comprehensive nonpoint source control program was highlighted for me last summer when I observed a State-owned vehicle liberally spraying herbicides on trees bordering my own public drinking water supply.

Despite the fact that nonpoint sources have been extensively described, many of the problems remain uncontrolled.

New England Sierra Club does not at this time urge the committee to require uniform control strategies for each State. We recognize the wide diversity of problems in individual States and regions and the widely differing strategies needed to address them.

Representative Oberstar's amendment would allow States the flexibility needed to develop programs more effective for that State.

We believe it is necessary, however, to add deadlines by which the States would implement their programs, and the requirement that EPA step in and administer a program if the State defers; thus providing an enforcement mechanism.

We also urge that funding be provided the State as well as technical assistance from EPA, and that funding should be available for use to repair sewer systems as well as other purposes.

Thank you very much for this opportunity to testify. We hope that the subcommittee will express strong support for H.R. 3282 and Representative Oberstar's amendment.

Mr. ROE. Thank you very much.

We will recess for 10 minutes while we go to vote, it's the Conable Amendment; we will be right back after that.

[Recess.]

Mr. ROE. All right, well, why don't we proceed, Ms. Agnew?

Ms. AGNEW. Thank you, Congressman Roe, and distinguished members of the staff.

Before I begin, perhaps I should reiterate to you my experience both here in Washington's metropolitan area and in the surrounding communities.

The Center for Environmental Strategy, whom I represent today, was put together in about 1975, to serve, primarily as plaintiff on Potomac River water cases; you know, we've been trying to tighten up the NPDES permits to include nutrient removal, because of the water quality limited estuaries; also to find some solutions for our mounting sludge problems.

Subsequent to that time I've worked with citizens groups in Tucson, and—after going to law school—have become a community consultant for small communities to try to help them understand their problem in the first place; work their way through the bureaucracies at the State and Federal level; and either to get Federal grants, if they need them; or to figure out a way to solve their problems themselves—which sometimes is possible.

You have consistently, Mr. Chairman—almost ever since I have come to hearings before you, asked the same question; which is: What do we do now? If you don't like it, what do you want to do about it?

So I think that's what I came here today to tell you.

And I will go through my testimony because it's quicker and easier to do that, and I hope that anything that is not clear will be clarified.

I offer for your consideration a minor amendment to title II, section 201(g)(2) to improve the practical application of that section.

You will remember, 201(g) requires grant applicants to study and evaluate alternative waste treatment techniques providing for water reclamation or recycling or eliminating pollutant discharges.

We all know that the elimination of pollutant discharges is exactly what the 1972 act required.

This section says that the Administrator shall not make grants unless the grant applicant has satisfactorily demonstrated—as it is presently written—it says, alternative waste management techniques have been studied and evaluated, and so on.

I propose inserting an amendment prior to that, that the Administrator not be allowed to give grants until a request for competitive proposals, an RFP, for all reasonable alternative waste management techniques, which fulfill the goals and objectives of title I, and the purpose of title II, has been advertised in at least three national newspapers, and at least three trade journals which are widely circulated within the water pollution control industry.

This proposed amendment, in addition to the 1972 amendments, brings section 201(g)(2) up to date.

More than 10 years ago when this section originally was written, reclaiming and recycling of water and elimination of pollutant discharges was anticipated.

As I remember, Mr. Congressman, you or Congressman Howard said that the act "bet on the come"—it was a betting term; and I just want to tell you today that in the last 10 years the "come" is here. There are lots of good alternatives out there; but the problem is simply informing and educating the local communities on what the alternatives are.

Today good alternative technology is a reality.

Many communities around the country have already constructed cost-effective clean systems, and many more are planned.

I cite Muskegon, Michigan, of course, at 45 million gallons a day, Colorado Springs, Lubbock, Tex., Nantucket, Fulton County, Ga., and so on and so forth.

The most pressing major problem remaining is informing community leaders who are shopping for effective low-cost treatment technology about what is available for them.

Typically, they are not told accurately about alternatives to conventional treatment which are competitively advantageous.

They are usually given only limited options recommended by their local engineer.

These communities routinely hire an engineering firm to oversee the streets, sidewalks, sewers, and so on. And my experience has been that when they need to construct a new sewer treatment plant, they say to the local engineer: build us a sewage treatment plant.

So he goes to his catalog and it's a Sears Roebuck catalog of component parts, and he says, I'll take, you know, so many tanks and so many pumps and so on and so forth; and that's the kind of treatment that he provides for them.

That has created tremendous problems, because, again, it's a kind of a patchwork add-on system.

Decisionmakers, the politicians who have to pass on this, naturally take the word of their local engineer. They don't have a complete understanding about what's happening in technology and what's available; and they don't understand the new approach to sewage treatment, recycling and reutilization of the energy in sewage.

Sewage is truly black gold. Sewage has tremendous economic potential for a community to take advantage of the biological and chemical energy.

They don't understand that, but they learn very fast.

They don't really have any choices from which to pick the best alternative.

Moreover, when recycling alternatives are enumerated by the local engineer, they are usually misrepresented or undervalued. Costs are inaccurately presented and inflated.

Those who have had experience with conventional systems only, understandably, cannot and will not be in favor of their competitors.

As a result, in the usual environmental impact statement alternatives become strawmen—systems to be evaluated and dismissed as unacceptable for one reason or another.

To date the market has been largely controlled by the hardware and chemical manufacturers, consultants, academics, and the construction grants bureaucracy within both the States and the EPA—that's one of the biggest problems we have today.

Less than 10 percent of EPA grants have been spent on the kinds of alternative technology, slow-rate irrigation which meets the recycling and no-discharge requirements of the act.

The time has come to break open the competitive process and to require—by law—that the most recent, inexpensive, and effective technology be presented to those who have to determine how to spend community tax dollars, and who have to live with the results.

After all, the Federal Government only pays a certain percentage of capital; it does not contribute a penny toward ongoing operation and maintenance costs.

Sludge is the biggest problem we've got to deal with—as we've got to do here in the District of Columbia.

Requiring requests for proposals prior to the step I process can accomplish this end.

A practical example illustrates this point:

Public officials in Stevens City, Va., were ordered to improve their wastewater facilities.

They refused to join a large regional system because of costs. An RFP was circulated and received nine proposals.

After presentations by the responding consulting firms, they chose a slow-rate irrigation system which will recycle their sewage problem into a revenue-producing asset as part of an overall development plan.

Recycling wastewater will, therefore, become a net benefit to the community as well as saving tax dollars.

The system chosen is, in fact, so inexpensive that the city fathers decided to finance construction themselves without asking for Federal funds. Yesterday, nearly a half-million dollars bond referendum was passed by the citizens of Stevens City, by an 80-percent margin.

Now, that's a model for the Nation.

Incidentally, Pat Ledford who represents the Washington office of the engineering firm who is designing the Stevens City facility is here; if you want to ask anything about how this occurred, citizen participation in it—she'll be glad to answer questions.

By contrast, officials of the city of Rehoboth, Del., are planning to build a conventional plant discharging to the Lewes-Rehoboth Canal.

The final environmental impact statement discarded alternatives which limited the decision process to unimaginative and costly projects.

The canal is used extensively for swimming and fishing, crabbing and other water-related activities.

The site chosen is a recently inactivated landfill in a salt marsh. It is actively outgassing methane, a highly flammable gas.

State officials have submitted a request to EPA for permission to lower the water quality standards in the canal by more than half, well below the lethal limit for many species of fish, in order to accommodate the sewage plant discharge.

They did this under the regulations preceding those which have just been promulgated; and to my knowledge, the region III Administrator has not signed off on those.

They maintain that, in spite of the discharge, the uses of the canal will not be changed.

If built as planned, the plant will hasten the eutrophication of Rehoboth Bay—it provides no nutrient removal—continue to pollute the canal, and thereby limit its use to the community.

Extremely high ongoing operational costs for treatment and sludge disposal will be incurred. The Rehoboth plant also doesn't take any notice of the surrounding area's very, very bad overflowing septic tank problems.

The plant also may become the first federally funded exploding sinking sewage treatment facility in the country. All efforts made by citizens so far—and we started working on this last summer—to persuade officials to stop this outrageous project and circulate an RFP for a better and cheaper alternative, have failed. My comments on the Rehoboth STP EIS have also been given to this committee.

As I worked with the citizens over there—and I did this voluntarily, because Rehoboth happens to be my summer watering hole—and I sail on the bay and swim in the area; and I am appalled at what is going on.

The more we looked at this, the more we began to realize that, you know, it's completely surrounded with agricultural land. And in doing a little research, I discovered there were some large farmers who really are very much interested in reutilizing the nutrients in the waste water, and taking it.

But because the proper mix of component parts have never been created or put together—in other words, the sewage problem had never been viewed holistically—this had never occurred.

I think it is because of the myopia of the conventional approach that it is cut off from occurring; you have to skip over that segment of the process and go back to the people who have to pay for it—who are just normal citizens like you and me—and say: does this make sense to you?

By not circulating an RFP, local officials never really understand that there are better ways to go.

It has become abundantly clear, therefore, that the conventional pollution control industry cannot be allowed to continue to resist the changes mandated by amendments to the Clean Water Act since 1972.

Millions of dollars allocated for the innovative alternative set-aside have been wasted because they have not been spent on thse low-cost effective projects.

Meanwhile, our rivers and lakes are becoming clogged with algae, and the nutrients—nitrogen and phosphorus—are discharged in ever greater amounts.

Algal contamination of our raw water sources is causing ever higher levels of trihalomethanes in finished drinking water after chlorination.

For example, we talk of toxics in our water supply—are nutrients toxics?

Yes. The answer is, of course, they are—after they're hit with chlorine, they are highly carcinogenic. This is what the Clean Drinking Water Act is about.

It you consider the position of our major east coast cities, which do not have protected water supplies—like Washington, D.C.—we get the cumulative effects in our drinking water supplies of all of the nutrient discharges from the entire Potomac River watershed, which is vast.

This is the reason we have those algal blooms in the impoundments upstream, behind the Little Falls Dam, Great Falls Dam; and this is why we get the high levels of trihalomethanes in the summertime in our District of Columbia drinking water.

As you know, Boston has a protected water supply; but it's overdrafted; and they'll probably be going to the Connecticut River.

New York City has a protected water supply, but it's over drafted; and they'll probably be going to the Hudson River.

Baltimore has a pretty good water supply. But even those areas that have protected water supplies are being encroached upon little by little by little. There is more demand for water.

But unless we keep the nutrients out—and the only systems that can do that are nonconventional systems—the alternative systems, where plants actually remove the nitrogen and phosphorus as part of the perfectly normal cycle of uptake—our water supplies will be destroyed. This is the reason it is imperative that we look at this problem as a whole throughout the river basin.

Furthermore, the conventional separation approach to treatment is causing enormous sludge problems, both as to cost and as to disposal.

Witness the fact that as the Potomac is temporarily cleaner, the high-rise mountain of sludge at Blue Plains grows taller. No one knows what to do about getting rid of it.

You've probably seen that recently on television.

Likewise, our beautiful and enormously productive estuaries are dying because of nutrient enrichment. This can be stopped only by preventing point-source discharges and non-point-source leaching upstream.

Here again, technology is well advanced by scientists outside the conventional sanitary and civil engineering professions, taking a holistic approach to the problems.

If local communities were fully aware of the effectiveness of these technologies, the benefit to both the local community and its downstream neighbors, they would certainly take full advantage of it.

20-955 O—84——150

Limited options are simply costing too much, environmentally and financially.

It's time to turn loose the American free-enterprise system and let the public know the wide range of promising new ideas available now.

This can be done by amending section 201(g)(2) to include a competitive search for creative and effective alternatives before any project can be federally funded. And I mean before the step-1 process. Because that step 1 is when you determine whether you are going to go for an alternative or you are going to go for conventional treatment.

So this has to be before sub-1.

That is my proposal for an amendment.

I also have another proposal for a deletion in H.R. 3282—would you like me to go on with that?

Mr. ROE. Yes, please.

Ms. AGNEW. Section 319 of H. R. 3282 proposes resurrecting the conference notion which was the only means of planning for watersheds before the 1972 amendments.

It was ineffective then; it will probably be even more ineffective now, because the authority given the conferees will duplicate and/or compete with programs started more than 10 years ago and currently in effect under the current legislation. Section 319 authorizes the conferees to make river basin master plans and to implement them by recommending priority corrective actions addressing point and nonpoint sources of pollution, monitoring, developing water quality and toxicity standards, effluent limitations, and to develop best management practices.

Admittedly, these are positive actions which must certainly be taken to protect the estuarine regions of the coast.

However, sections 303(e) and 209 of the act already demand both State and river basin plans.

Areawide waste management was supposed to have been addressed pursuant to section 208.

Admittedly, most of these programs have failed. The reason for that failure is easy to see: River basin planning starts with land use planning—the source of water pollution.

If and when public officials are convinced that they have to start making decisions about what happens between the raindrop and the river, planning will begin in earnest.

Until then, it won't.

Until then, spending nearly a quarter-billion dollars on another duplicative bureaucracy will not speed up the process.

Estuarine problems don't start in the estuaries. They start upstream in the watersheds.

Throwing more money at a program that has not worked usually doesn't get results.

On the other hand, cutting budgets unless some progress is made, might get some successful results.

If EPA would only say that no projects would get Federal grants unless and until the planning process produced projects which will remove nutrients, cleanup of all estuaries would begin immediately.

Cleanup of our surface raw-water sources would certainly be an important additional benefit because it would substantially reduce the amounts of cancer-causing trihalomethanes in our finished drinking water.

Before adding more financial fuel to the fire, please consider the words of Mr. Bill Roulette, a Tilghman Island waterman and chairman of the Izaac Walton League's Chesapeake Bay Committee—and I added the article as an appendix these are his words, not mine:

> We all screwed up the Chesapeake Bay because we are too selfish, and lazy and too dominated by self-seeking land grabbers. Now we are playing with something bigger than all of us put together. The facts are known and the facts are constantly ignored. It kills me to hear people say, "we are interested in cleaning up the Bay." If they were really interested, they would not allow the bureaucrats to run wild. It's just the mouthings of the politicians; it doesn't amount to a hill of pins. The thing that's so aggravating is that we have all these high-priced studies and nobody has done a thing.

The thing recommended here is an amendment to the act which will start the competitive, creative, American free-enterprise system started on the local level cleaning up local systems in the areas where pollution originates, confining disposal of pollutants so they will not migrate to cause water or other pollution, and allowing more efficient use of the chemical energy contained in waste water to offset costs of treatment.

Land treatment, slow-rate irrigation, the most effective alternative technology in most cases, establishes the relationship between the volume of wastes generated by numbers of people, both municipal and industrial, and the amount of land required to reconvert these wastes into useable energy.

As such, it is primarily a land-use planning tool.

I have given you a couple of other things which are an addendum to this testimony:

One is a 1979 report from the House Appropriations Subcommittee on Surveys and Investigations, which looked at sewage treatment facilities all around the country and found that they had failed, generally, in many ways to meet their permitted effluent limitations.

Part of that is also one of the first GAO reports. There are many studies by the General Accounting Office since, and a very good recent series that came out of the IG's office in EPA on various cities around the country.

I didn't include those because it would have been a stack of documents that would have been duplicative of yours; your staff members can get them from the IG in EPA.

They clearly show that conventional treatment over what we euphemistically call sloppy secondary—which is 30 milligrams per liter of suspended solids, and BOD-5—simply isn't achievable, in a word. If anybody talks about anything higher than that in a conventional treatment facility on an ongoing finely tuned well-tested basis, they are simply deceiving themselves.

We've spent $40 billion on these facilities so far under the Clean Water Act amendments. In my view, we have peaked if we continue to fund conventional sewage treatment plants.

From now on water pollution control will go downhill. I am pretty sure that will be the case in the Potomac River. Blue Plains is running 40 million gallons a day over capacity; the only reason the Potomac is getting cleaner is because the engineers have changed the discharge point to the Maryland side of the river. Blue Plains effluent is drifting down under the Wilson Bridge to Smoot Cove, an underground gravel pit which has underwater leaching from clear fresh water. The Asian clams have moved in. They are doing a great job of cleaning up that oxidation pond and the sewerage problem.

But the really astonishing thing is that a developer is now going to build a huge—huge—development, called Bay of the Americas on this bay, which has now become in effect, an extension of the Blue Plains sewage treatment plant.

So we're getting very close to the time when these things are all going to break apart.

Another one of my submissions to you are some reprints over time from the New England Journal of Medicine about outbreaks of waterborne diseases.

I think very shortly we will see these: cholera, for example.

There have also been, as I understand, in the Ocean City area, outbreaks of hepatitis, which were very carefully kept out of the paper. That would really cut down on the summer tourist business if people found out.

We're looking at AIDS, Karposi's Sarcoma; we're looking at Legionnaires' disease. It will be just a matter of time epidemiologically, if we continue to discharge our wastes, poorly treated, into our drinking water supplies, before the capability that we now have to resist is overcome.

I think the big field of water pollution is going to move very quickly into the field of public health and epidemiology.

Mr. ROE. Thank you.

We almost have to ask the same question we asked the lady from Indiana, you know—the States have to take an interest, communities, people——

Ms. AGNEW. That's correct, that's correct.

Mr. ROE. I sat on this committee before 1972 when we wrote this bill, right from the very beginning we've run into that.

A great deal of the problem has been funding reduction; but above and beyond that is: Why should the Federal Government be badgering the people of the States to do something about protecting the very life they lead?

That's about where we're at.

Ms. AGNEW. Well, Congressman Roe, I think that the problem—looking at it from the opposite end of the scale; you being at the top and the people in the local community being at the bottom—I think what stands in the way is the conventional water pollution control profession that has become an anachronism.

That is the profession of the sanitary and civil engineers who have traditionally had the responsibility for dealing with the problem.

As I say in my testimony, these people control the EPA construction grants program. They control the State programs.

Our biggest problem when a community wants to do something right, is the blockers in the State health department and the State water control boards.

These are people who realize that if they allow these systems to go forward, they'll be out of work; because they don't understand how it's done.

These systems are very sophisticated, they require multidisciplinary approaches of hydrology, soils, farming, cropping, and so on and so forth, not to mention the fact if you're going to get into recycling, energy into electricity, for example, you're going to have to know about digesters—there are just any number of kinds of things.

But what I'm saying is that there's a whole new crop of very inventive free enterprise types have popped up with excellent alternative technology. It's sort of like making changes in automobiles:

Detroit never got the message until all of a sudden all those little tiny cars came in from Japan because of the oil crisis.

Now, the same thing should happen to the sanitary engineering profession.

People in the local communities don't really care what it is they buy as long as the final product meets the requirements, the Federal requirements, which certainly should stay in place as long as it doesn't cost them too much.

When you are recycling and reutilizing chemical energy it won't, because they become a net benefit.

Mr. ROE. If it doesn't cost them too much?

Ms. AGNEW. Right.

Mr. ROE. You know, when my colleague and I were walking back after voting, we said to ourselves: how do we get across in writing the law, how do we get across the idea that it's what they're putting into that water that they're drinking?

All the political parties and Washington aren't going to solve it unless the people themselves show they care a little bit.

Mr. AGNEW. That's right.

But they want to solve the problem. And I'm saying that the reason they haven't been able to is because they don't know what excellent cost-effective alternatives are available.

Mr. ROE. That's part of it. And I think you made an eloquent presentation; that's part of it.

But let me tell you something:

The minute it costs 20 cents more because it's not something that you put in the icebox or under the stove or you can ride in it—you can't see it's there—and can't drive it, but it's there—and that testimony was given earlier—well, you know, you open the tap, and out the water comes, and you flush the toilet and it's gone. That's all you have to do with it.

But, by God, let me tell you—and listen, I've been mayor for a town and done every single office there, and the minute it's $2 more—and we've got case after case testified to here—the people scream bloody murder.

Your people in Massachusetts on the 2½ percent proposition, is it?—what do you want from us?

If that's their direction—and I don't mean to be rude or be misrepresenting you—but it's been a long day listening. [Laughter.]

You know, what do the people of Massachusetts want from the people of New Jersey or California or Oregon, if they're not willing to make an investment in the quality of their life, and put up their proportionate share to get the job done, why should they complain to everybody else?

That's what I'm trying to get at.

Who selects the priorities?

Now, I happen to believe, serving on many committees, I happen to believe that the water the people put in their bodies is determining the health of the Nation, one way or the other.

Ms. CHAPMAN. Sure.

Mr. ROE. Now, some place along the line, the people, and the Congress, have to put this program at its proper priority.

I happen to believe they're not going to solve the problem with conventional technology—they had a real bust in Hershey, Pa., and other places——

Ms. CHAPMAN. That's right.

Mr. ROE. But having said that, when Congress and the people have to make up their minds with a $200 billion deficit, where do they want to expend their priorities?

Does their health matter to them? And if their health matters to them, they have got to be able to go out and say, this is what we ought to be doing.

But they're not doing that.

Ms. AGNEW. You are absolutely right, and we are coming from the same place.

When I started working with the folks in Rehoboth they kept saying, we don't want to put that nasty stuff on our land.

I said, if I gave you $45,000, what would you do with it?

Mr. ROE. Put it on the land?

Ms. AGNEW. And they said, what do you mean, $45,000?

No, no—I'm talking about profits. I'm talking about tax-free $45,000; because in a 3-month period, that is what the nutrient value is in the fertilizer value alone of the sewage in Rehoboth Beach.

Now, if you add the water value to it, it depends on whether or not it's raining, you know; if it's a dry summer, there's no price you can put on water. If it's a wet summer, then water isn't very valuable.

But the point is, the chemical energy in sewage is extremely valuable.

Now, when we advocate this kind of system, what we say is——

Mr. ROE. Would you yield for a moment?

There's nobody on this committee that understands that more than I do.

Ms. AGNEW. OK.

So what I'm saying is if you go along with this amendment, and my feelings won't be hurt if you "word-smith it" and improve it—because I am sure you can—if you go along with this amendment, basically and insure somehow, stick it in the committee report, that EPA requires the RIP's prior to a step 1 grant, maybe this becomes step 1, and then the step 2 is the evaluation of the alternatives—then and only then will the local people in the community

bypass the prejudices of the people to whom they usually give the problem.

In other words, it will create practically instantaneously a whole different economic incentive for change. And we are talking about change. We're really talking about change in the broadest perspective of all.

And I guess my final word to you today is, the change has got to come before we put any more money into water pollution.

We can't afford to build any more conventional plants. Believe me, I have worked on Blue Plains, and it's got to be the most difficult situation here that there ever was, since 1972; and I can assure you that it will remain in everybody's conscience as the most egregious waste of money that has ever been perpetrated—a billion dollars for that sewage treatment plant—it's just absolutely unthinkable.

We know it now. The people working there know it. Everybody knows it. There's no way to get rid of their sludge.

And they say to me, Ms. Agnew, what are you going to do with the sludge?

You know what they're going to try to do? They're going to try to burn it.

And we have those incinerators, turned off in 1972, because they were going to blast that stuff right into the intakes of this, among other, Federal buildings; and that, we determined, was not a very good idea.

Mr. ROE. Well, we want to thank you very much. Please don't consider us rude——

Ms. AGNEW. No, I understand.

Mr. ROE. But we've got other matters to deal with right now.

We thank you for your testimony.

Ms. CHAPMAN. Mr. Chairman, I also want to respond to that; and I realize you have to go vote.

Would it be possible for me to submit a response to your previous question in writing?

Mr. ROE. Yes.

Ms. CHAPMAN. Yes, you mentioned Proposition 2½ in Massachusetts, and it's very important.

Mr. ROE. Yes, I'd like to know for the subcommittee's benefit, what kind of impact has that had, that you can discern at this early date? What kind of impact has that had on the prioritizing, prioritization, of the use of local funding toward environmental issues?

Ms. CHAPMAN. That's what I'd like to address.

Mr. ROE. All right. Thanks very much.

The subcommittee will recess until tomorrow morning at 10 o'clock in room 2218.

[Whereupon, at 4:10 p.m., the hearing was recessed, to reconvene at 10 a.m., Thursday, November 10, 1983.]

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

THURSDAY, NOVEMBER 10, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 10:25 a.m., in room B-318, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. Good morning, ladies and gentlemen. The Subcommittee on Water Resources will come to order.

We are continuing our hearings on the Clean Water Act and we have with us as our first witness today Mr. Garroll Mace, executive director of the Clearfield, Pa., Chamber of Commerce, and we defer to our distinguished colleague from Pennsylvania, the Honorable Bill Clinger, to offer our formal welcome.

Mr. Clinger?

Mr. CLINGER. Thank you very much, Mr. Chairman, and Garroll, I would like to welcome you on behalf of the committee.

Why don't you take the committee table, Mr. Mace, and I would just like to offer my personal welcome to you. I can vouch for the fact that you have been extremely active in promoting economic development in the county which desperately needs it with very high unemployment and I also notice that you have given a great deal of study and concern about the impact that the BAT requirements would have on that kind of development.

So I look forward to your testimony and am delighted that you could be with us today.

TESTIMONY OF GARROLL MACE, EXECUTIVE DIRECTOR, CLEARFIELD, PA. CHAMBER OF COMMERCE

Mr. MACE. Thank you very much.

Mr. Chairman, Congressman Clinger, and distinguished members of the subcommittee, I am here representing the Clearfield Chamber of Commerce of which I am the executive director. I want to thank you for allowing me the privilege of addressing you. My appearance is a special personal honor for me as I have never addressed Congress before, and for Clearfield, Pa., as far as I can tell, no Clearfielder has testified before Congress.

The issue that brings me here is BAT—best available technology. You know in my part of the country, we have many, many sportsmen, particularly fishermen. It is a sportsman's paradise.

Since you passed the Clean Water Act, Pennsylvania businesses and Clearfield have done our share to clean up our water and today I am happy to report that according to a January 26, 1981, Associated Press report, cleanup efforts on the Susquehanna River have made the river clean enough for shad and other fish to return. The report said, "Shad had not been present in the river for more than 50 years for various reasons, including overfishing (and) pollution," but "water quality is now adequate to sustain spawning."

Tables, included in the three-State water quality report entitled "Assessment of Water Quality Conditions—Ohio River Mainstream 1980–81," indicate that 81 percent of the Pennsylvania miles of the Susquehanna River in the 23d Congressional District are meeting Federal clean water standards.

"It is apparent from the continuing trend of water quality improvement that progress in attaining the 1983 fishable/swimmable goals set foth in the Clean Water Act is being realized," the report states.

"The best measure of the success and effectiveness of Pennsylvania's water quality management program is in the improvement in the quality of polluted or degraded waters and the adequacy of protection of good quality waters. Pennsylvania has recorded these changes in its annual reports since 1968. The inclusion of streams with improved water quality is an indication that these waters are now meeting State water quality standards or have exhibited significant progress toward this goal."

We realize there is still more to be done to clean up the water, and we strongly favor a continuing effort to keep and improve our water quality. However, the issue is how best and most effectively to go about this.

We believe the States and EPA should set water quality standards and all companies should meet these, period. If a company is polluting the water beyond these standards, it should stop.

We in Clearfield had a meeting on this, and 60 of us from Clearfield, Elk, and Centre Counties turned out just to discuss the issue with Congressman Clinger. Our Congressman has been very responsive to our problems. You see Clearfield, as with many if not most cities in the Northeast, is not exactly experiencing a business boom with many new businesses opening up and most importantly, new jobs being created. We are trying hard to hang on to what we have. The effect of a mindless blanket application of BAT would be devastating to our workers and businesses.

Our community leaders spoke up at this meeting. Bob Gausman of Ridgeway Color & Chemical said his company employs about 1 percent of workers in Ridgeway, Pa. His small firm has spent about three-quarters of a million dollars to date to meet current regulations—and he has done a damn good job of meeting our strong State and Federal laws. But if he is subject to BAT, it may not make the water significantly cleaner than it is, but could force him out of business.

Other Pennsylvania businesses and workers have been seriously hurt by foreign competition, and while a blanket application of BAT will make our products more costly, BAT doesn't apply to for-

eign nations and we will be even less competitive than we are today.

Clearfield is a small community, and firms like Ridgeway and many others I represent want to be good citizens and keep our water clean. But we ask you to put at least some faith in us at the State and local level.

If a business is being a good citizen, and can prove at its own expense that the imposition of BAT will not make the water it is discharging into any cleaner, why should it spend valuable limited capital on BAT.

It doesn't make sense that some bureaucrat, who has never been to Clearfield, issues nationwide technology standards based on the individual success of one facility somewhere, anywhere in the Nation.

What we are saying is please, before you pass this burden onto us, please write the law in a fair way. We share your goals of clean water. We want polluting stopped, but if a business is not polluting, it should be given a chance to prove this. If EPA or the State of Pennsylvania agrees that it is not polluting, this business should not be forced to put on costly equipment because some bureaucrat in Washington doesn't trust American business.

Mr. Chairman, I ask the consent of the committee to submit a letter from Ridgeway Color & Chemical and my testimony into the record.

On behalf of these businesses and citizens of Clearfield, thank you.

Mr. ROE. I want to compliment you on your testimony and the progress that is being made in your community.

I don't know whether it is being done because Bill Clinger is your Congressman. He can be pretty tough but he is doing a super job.

Mr. MACE. Mr. Chairman, the laws in Pennsylvania some of them are even more stringent than those of the Federal Government.

Mr. ROE. Are there any questions?

Mr. CLINGER. Could you give us a little more specific data on where the jobs come from in the area and how you view the impact that rigid imposition of BAT would have on the ability to attract new jobs, new industry in the area?

Mr. MACE. A rigid implementation of BAT scares the hell out of me. The unemployment rate in Clearfield County is 18½ percent. When we advertise, we do have an industrial development sector in the chamber of commerce and in trying to solicit industry to locate in our area one of the things we bring out is the quality of water that we have and also the amount of water. So if you are going to attract an industry that is a user of a large quantity of water naturally, the BAT would have a great influence on locating that industry in that area.

The new employment we would have in the area would come from expansion of the businesses currently located there. If additional requirements are placed on those businesses, they may, No. 1, look elsewhere to locate or they may say that rather than expand and hire new employees, we are going to spend our money

that we have to spend on a BAT improvement. Therefore, this would eliminate any further expansion of that company.

Mr. CLINGER. Thank you.

Mr. Chairman, I know that Mr. Mace has some letters from other groups in Pennsylvania.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. Mr. Chairman, I would like to also welcome this witness as a Congressman from Pennsylvania and while I came in late, I did have a chance to review the comments that you made. I wonder if you have any comments about nonpoint source pollution and the problems of agricultural runoff into the Susquehanna that is causing some problems downstream. I think your accurate statements here indicate that a great deal of cleanup has occurred but there are some reports that in the Susquehanna because of nonpoint source pollution, we are having some problems.

Do you have any comments from your point of view?

Mr. MACE. Yes, sir. I would like to address that. Yes, there is some runoff from farms. Also there is some pollution that comes about as a result of abandoned mines in the area. Money is to be made available to help take care of some of those although Clearfield has not received its share of that money as yet. There are some areas that do need cleanup, but these are abandoned mines.

When I look at the reclamation that has been done through the strip mining, some of the contour of the land is even greater and better and prettier than it was to begin with and talking to a person who is involved with the extension service in Clearfield, the reclaimed areas have now become haven for the whitetail deer which is very common in that area.

Mr. EDGAR. But you as a chamber are not concerned about mine drainage or agricultural runoff as it relates to the quality of the Susquehanna water system?

Mr. MACE. We have a concern, yes, sir. As to what degree of pollution I can't say.

Mr. EDGAR. It might be helpful if your chamber and others in the area could take a look at that because I think we have dealt fairly well with point source pollution and we are looking at corrections and modifications of that law. But the whole center part of Pennsylvania having the watershed go into the Chesapeake and into the lower reaches of Maryland and Delaware are requesting the Congress to invest some funds. It is going to probably be in the neighborhood of, perhaps even as high as $100 million to clean up the Chesapeake from the increase to pollutants that are infiltrating down the lower stream area.

It is not just all coming from your area but it is a problem that we are beginning to see and I think any contribution you can make in that area will be very helpful.

Mr. MACE. Thank you.

I find that too many people are coming to Congress and asking for moneys. When I look at companies who are spending their own money such as Ridgeway Chemical investing three-quarters of $1 million to help cleanup money going back into the streams and what have you, I think this is to be commended, sir.

Mr. EDGAR. I have no problem with that. I think that is fine and I would hope that that was done at all the centers where there is

point source pollution. I guess my concern would be where you don't have a pipe going back into the stream but you have just the general drainage, agricultural runoff, runoff for the streets and sewers and things that are causing problems.

Thank you.

Mr. ROE. I thank the gentleman from Pennsylvania. Are there any further questions for Mr. Mace.

We want to thank you very much for adjourning to Washington. We appreciate your taking the time to testify before us.

Mr. MACE. Thank you, sir.

Mr. ROE. Our next witness is Dr. Norman H. Brooks, engineering consultant for the city and county of San Francisco, accompanied by Ms. Jan Berry, assistant executive director, San Francisco clean water program, Department of Public Works, city and county of San Francisco.

We welcome you, Dr. Brooks and Ms. Berry to our committee.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF JAN BERRY, ASSISTANT EXECUTIVE DIRECTOR AND NORMAN H. BROOKS, ENGINEERING CONSULTANT, SAN FRANCISCO CLEAN WATER PROGRAM

I am Norman H. Brooks, appearing today as an engineering consultant on marine disposal for the City and County of San Francisco.

Although I am appearing here on behalf of San Francisco, my regular position is James Irvine Professor of Environmental and Civil Engineering, and Director of the Environmental Quality Laboratory at the California Institute of Technology. At Caltech, my work includes research and teaching of on the subject of marine disposal.

With me is Jan Berry, the Assistant Executive Director of the San Francisco Clean Water Program. The Clean Water Program is a division of the Department of Public Works of the City and County of San Francisco.

Introduction

Section 301(h), an important amendment to the Clean Water Act in 1977, allowed municipal ocean discharges to meet water quality requirements rather than the technology-based requirement of secondary treatment. The procedure involved applications for waivers (from mandatory secondary treatment) by municipal discharges, and permits were to be granted if the ambient water quality was demonstrated or predicted to meet appropriate receiving water standards. The purpose basically was to build only those treatment facilities (i.e., secondary treatment plants) that were actually necessary to preserve ocean water quality. A case-by-case approach was adopted, in which actual ocean conditions at each proposed discharge site were considered.

This testimony will address two aspects of the proposed revisions in H.R. 3282 that appear to be contrary to the original purpose of Sec. 301(h): retreatment, and chemical treatment to control pathogens.

Pretreatment

Section 5(b) of H.R. 3282 (page 5, line 22) would add the following provision to Sec. 301(h):

* * * "(6) in the case of any treatment works serving a population of fifty thousand or more, with respect to any toxic pollutant introduced into such works for which there is no applicable pretreatment requirement in effect, the applicant has in effect a pretreatment program which, in combination with the treatment of discharges from such works, removes the same amount of such pollutant as would be removed if such works were to apply secondary treatment to discharges and if such works had no pretreatment program with respect to such pollutant;" * * *

Although I certainly agree with the intent of the Resolution to control toxic pollutants, I believe the proposed approach is unsound and unworkable for several reasons:

(1) *The level of control mandated by this proposed provision may be far more stringent than necessary to protect the ocean.* Consider a system such as San Francisco's

which serves an area that is almost entirely residential and light commercial (retail, financial, professional, etc.). In such a case, there are relatively low levels of toxic pollutants, entering the sewer system, mainly coming from diffuse sources (like chromium from plumbing fixtures, or cadmium and zinc from galvanized pipes). Even though the concentration of toxic substances may already be well below safe levels in primary plant effluents in conjunction with an existing pretreatment program, this Amendment would require waiver applicants to implement a more stringent and restrictive pretreatment program, even though all ocean requirements are met and no problems are identified.

(2) In the case municipalities with heavy industry, especially those using or producing toxicants that are not efficiently removed by secondary treatment, the pretreatment levels as specified in this Amendment might still be inadequate to protect water quality.

A far approach for establishing proper pretreatment is one based on the ocean water quality which is necessary to avoid chronic or acute effects on marine organisms or hazards to humans. The State of California Water Resources Control Board has in its 1978 "Ocean Plan",[1] successfully demonstrated an approach based on receiving water quality. For each outfall, effluent limits for a variety of toxic substances are set so that, after the initial buoyant jet mixing, the levels are below safe limits for ocean water quality based on toxicity tests. Pretreatment programs are then designed so that, after the wastewater is treated, these effluent limits will be met. San Francisco is complying with this approach, and should not be required to adopt another procedure that is not based on ocean water quality.

(3) The baseline proposed, i.e., assuming to pretreatment program, is ill-defined because all larger sewerage agencies have had industrial waste control programs for many years. (San Francisco's pretreatment program was initiated 10 years ago.) It would be impossible to reconstruct in a rational way what concentrations of toxic substances would be in the wastewater if the control programs did not exist. Many industrial processes have changed considerably, and some toxic substances simply aren't used anymore.

(4) The degree of removal of various toxic pollutants by the secondary treatment process is poorly defined and varies from system to system. It is therefore a poor basis upon which to base pretreatment requirements.

In summary, the proposed revision would result in substantial additional costs for San Francisco and similar cities without providing water quality benefits, because strict ambient requirements are already met. Alternate approaches, such as in the California Ocean Plan, are soundly based scientifically and are cost-effective.

Chemical treatment to control pathogens

The proposed revisions in HR 3282 include Sec. (9) as follows:

* * * "(9) the effluent which is discharged from such works is currently receiving primary treatment by screening, sedimentation, and skimming, and chemical treatment to control pathogens and meets the criteria established under section 304(a)(1) after initial mixing in the waters surrounding or adjacent to the point at which such effluent is discharged."

There is no need to include "chemical treatment to control pathogens" in the Amendment's definition of primary treatment.

The purpose of primary treatment is to remove readily settleable and floatable solids. This removal process, in conjunction with the use of a well-designed outfall system, to provide high dilution and wide dispersal, provides valuable protection to the ocean. However, primary treatment is not intended to reduce pathogens or BOD (biological oxygen demand), except coincidentally with solids removal. Pathogens can instead be controlled in the ocean by discharge through a multiport outfall achieving high dilution far from shore. San Francisco has under construction a $180 million, 4½-mile-long, outfall which will achieve more than 100 to 1 initial dilution. This outfall has been designed to meet existing state and federally approved bacteriological standards for pathogen control without chemical disinfection.

Operating experience of other agencies in California with long outfall and multiport diffusers (i.e. City of Los Angeles at Hyperion and County Sanitation Districts of Orange County) shows that bacterial requirements are easily met without disin-

---

[1] California State Water Resources Control Board, adopted and Water quality control plan for ocean waters of California, Resolution No. 7B-2, 15 pp.

California State Water Resources Control Board (1983). Draft Environmental Impact Report: Amendment of the Water Quality Control Plan, Ocean Waters of California (probably to be adopted in early 1984).

fection. The same basic design procedure has been used for the new San Francisco outfall.

Furthermore, since the by-products of chemical disinfection can be damaging to marine organisms, chemicals should be used only when necessary to meet bacteriological requirements. The California Ocean Plan does not require disinfection, and EPA dropped disinfection from the technical definition of secondary treatment several years ago.

The cost of this provision of San Francisco, after the new outfall is put into full operation, would be up to $4 million annually (in 1983 dollars) for chemical disinfection that would not be necessary to preserve water quality. Therefore I propose that "chemical treatment" be stricken from the text or, as in the case of S. 431, the words "where appropriate" be inserted.

Mr. ROE. Please proceed.

TESTIMONY OF NORMAN H. BROOKS, ENGINEERING CONSULTANT, CITY AND COUNTY OF SAN FRANCISCO, ACCOMPANIED BY JAN BERRY, ASSISTANT EXECUTIVE DIRECTOR, SAN FRANCISCO CLEAN WATER PROGRAM, DEPARTMENT OF PUBLIC WORKS, CITY AND COUNTY OF SAN FRANCISCO; STEVEN S. ROSENTHAL, LEGAL COUNSEL, CITY AND COUNTY OF SAN FRANCISCO; AND SHARON EDWARDS, WASHINGTON REPRESENTATIVE AND LEGISLATIVE COUNSEL, CITY AND COUNTY OF SAN FRANCISCO

Dr. BROOKS. Thank you, Mr. Chairman.

I am Norman H. Brooks, appearing today as an engineering consultant on marine disposal for the city and county of San Francisco. With me is Jan Berry, the assistant executive director of the San Francisco clean water program. The clean water program is a division of the Department of Public Works of the city and county of San Francisco.

Now, although I am appearing here on behalf of San Francisco, my regular position is James Irvine professor of environmental and civil engineering and director of the environmental quality laboratory at the California Institute of Technology.

I would like to add a few more words about my experience. As a consultant, I have worked on a variety of projects for major discharges on the west coast. In fact, I was involved in the design of the San Francisco 4½-mile outfall that is now under construction. Also, I have worked in Hawaii and abroad.

My specialty is the hydraulic design of long outfalls and diffusion structures as part of an overall system of pretreatment, treatment, and outfall diffusion to meet water quality requirements. In other words, I take the water quality requirements and help make a system that will meet those water quality requirements. In fact, the characteristics of the ocean, its depth, and stratification is an important part of my business and distinguishes east versus west, if you like.

I might say a little bit more about that later. I have developed some of the engineering techniques of outfall design which take advantage of the favorable characteristics of the Pacific coast to greatly improve water quality to such a degree that the 301(h) waiver program is technically appropriate.

I will be glad to answer questions in general about outfalls if you wish when I finish my statement. I will go back to the statement.

Section 301(h), an important amendment to the Clean Water Act in 1977, allowed municipal ocean discharges to meet water quality requirements rather than the technology-based requirement of secondary treatment. The procedure involved applications for waivers (from mandatory secondary treatment) by municipal discharges, and permits were to be granted if the ambient water quality was demonstrated or predicted to meet appropriate receiving water standards. The purpose basically was to build only those treatment facilities (that is, secondary treatment plants) that were actually necessary to preserve ocean water quality.

In other words, back to the system whereby you combine the pretreatment package that you need to meet water quality in a case-by-case approach which includes oceanographic considerations.

Now, I particularly want to address two technical aspects of the proposed considerations in H.R. 3282 that appear to be contrary to the original purpose of section 301(h); namely, pretreatment and chemical treatment to control pathogens. The original purpose, of course, is to have a water quality-based approach rather than a technology base.

On pretreatment, the proposed section 5(b) of H.R. 3282, would add the following provision to section 301(h):

> * * * (6) in the case of any treatment works serving a population of 50,000 or more, with respect to any toxic pollutant introduced into such works for which there is no applicable pretreatment requirement in effect, the applicant has in effect a pretreatment program which, in combination with the treatment of discharges from such works, removes the same amount of such pollutant as would be removed if such works were to apply secondary treatment to discharges and if such works had no pretreatment program with respect to such pollutant; * * *

I think this really means if you are not going to have a secondary treatment program, you ought to have a pretreatment program that does as well as secondary pretreatment would have done if you had had it.

Although I certainly agree with the intent of the resolution to control toxic pollutants, I believe the proposed approach is unsound and unworkable for several reasons:

First, the level of control mandated by this proposed provision may be far more stringent than necessary to protect the ocean. Consider a system such as San Francisco's which serves an area that is almost entirely residential and light commercial (retail, financial, professional, et cetera). In such a case, there are relatively low levels of toxic pollutants entering the sewer system, mainly coming from diffuse sources (like chromium from plumbing fixtures, or cadmium and zinc from galvanized pipes). Even though the concentration of toxic substances may already be well below safe levels in primary plant effluents in conjunction with an existing pretreatment program, this amendment would require waiver applicants to implement a more stringent and restrictive pretreatment program, even though all ocean requirements are met and no problems are identified.

Second, in the case of municipalities with heavy industry, especially those using or producing toxicants that are not efficiently removed by secondary treatment, the pretreatment levels as specified in this amendment might still be inadequate to protect water quality.

In other words, a far better approach for establishing proper pretreatment is one based on ocean water quality which is necessary to avoid chronic or acute effects on marine organisms or hazards to humans. The State of California Water Resources Control Board has in its 1978 ocean plan successfully demonstrated an approach based on receiving water quality. They are currently about to adopt a 1984 revision. For each outfall, effluent limits for a variety of toxic substances are set so that, after the initial buoyant jet mixing, the levels are below safe limits for ocean water quality based on toxicity tests.

Pretreatment programs are then designed so that, after the wastewater is treated, these effluent limits will be met. It is a combined package of pretreatment, treatment, and outfall mixing put all together that meets stringent water quality requirements. You can make them as stringent as you like, at least you are targetting the thing that you are really after, the water quality in the ocean.

San Francisco is complying with this approach, and should not be required to adopt another procedure that is not based on ocean water quality.

Item 3, the baseline proposed, that is, assuming no pretreatment program, is ill-defined because all large sewerage agencies have had industrial waste control programs for many years. San Francisco's pretreatment program was initiated 10 years ago. It would be impossible to reconstruct in a rational way what concentrations of toxic substances would be in the wastewater if the control programs did not exist. Many industrial processes have changed considerably, and some toxic substances simply aren't used anymore.

Four, the degree of removal of various toxic pollutants by the secondary treatment process is poorly defined and varies from system to system. It is therefore a poor basis upon which to base pretreatment requirements.

In summary, the proposed revision would result in substantial additional costs for San Francisco and similar cities without providing water quality benefits, because the strict ambient levels in the California ocean plan are soundly based scientifically and are cost-effective because they are related to the resultant water quality.

The other issue is related to chemical treatment to control pathogens. Here the difference between east and west is particularly important.

The proposed revisions in H.R. 3282 include section 9 as follows:

> * * * (9) the effluent which is discharged from such works is currently receiving primary treatment by screening, sedimentation, and skimming, and chemical treatment to control pathogens and meets the criteria established under section 304(a)(1) after initial mixing in the waters surrounding or adjacent to the point at which such effluent is discharged.

In my opinion, there is no need to include "chemical treatment to control pathogens" in the amendment's definition of primary treatment.

The purpose of primary treatment is to remove readily settleable and floatable solids. This removal process, in conjunction with the use of a well-designed outfall system to provide high dilution and wide dispersal, provides valuable protection to the ocean. However, primary treatment is not intended to reduce Pathogens coincidentally with solids removal. Pathogens can instead be removed by

20-955 O—84——151

achieving high dilution far from shore. This is a technology we are using on the west coast.

San Francisco has under construction a $180 million, 4½ mile long outfall which will achieve more than 100 to 1 initial dilution. This outfall has been designed to meet existing State and federally approved bacteriological standards for pathogen control without chemical disinfection. In fact, I might add that the California ocean plan specifically directs dischargers to design their systems so that the bacteriological requirements can be met without disinfection because of the belief and the known fact that the byproducts of disinfection, of chlorination, and ozonenation can be damaging to marine life.

Operating experience of other agencies in California with long outfall and multiport diffusers (that is, city of Los Angeles at Hyperion and county sanitation districts of Orange County) shows that bacterial requirements are easily met without disinfection. While at the same time, meeting all the bacteriologic requirements of the California Department of Public Health and the California Water Resources Control Board. The same basic design procedure has been used for the new San Francisco outfall.

Furthermore, since the byproducts of chemical disinfection can be damaging to marine organisms, chemicals should be used only when necessary to meet bacteriological requirements. There are many places particularly on the east coast where such disinfection will be required.

The California ocean plan does not require disinfection, and EPA dropped disinfection from the technical definition of secondary treatment several years ago. I think the main point here is that the requirement ought to be stated that you met the bacterial requirements in the receiving waters and then wait and see what you need to do to achieve that, whether you can do it naturally in the ocean, which is a hostile environment for bacteria and pathogens, or whether you have to do it chemically.

The cost of this provision to San Francisco, after the new outfall is put into full operation, would be up to $4 million annually—in 1983 dollars—for chemical disinfection that would not be necessary to preserve water quality. Therefore, I propose that "chemical treatment" be striken from the text or, as in the case of section 431, the words "where appropriate" be inserted.

I might add in the same vein there is another provision in the Senate version of the bill which says that primary treatment should have 30 percent BOD removal. Again, for west coast outfalls and deep water which has lots of oxygenation capacity, there is no need for a specific technical requirement of BOD removal. BOD removal is a purpose of secondary treatment not of primary treatment, so to say that primary treatment should have 30 percent BOD removal doesn't make any sense in terms of a water quality objective.

I am pleased that that is not in your version of the bill, but if it comes up for conference, I hope you will recommend to your Senate colleagues that that also be stricken as a requirement because it is not consistent with the 301(h) waiver.

I would like to close with just a couple of remarks about east versus west. I know it is a matter of some interest. I sometimes tell

my students on the first day of class, I say, you know, if you look at the atmosphere, you find that in the East it blows a lot more than it does in the West. They don't have the inversion that we do in Los Angeles with the smog problem, but the reverse is true in the ocean. In the ocean on the east coast, we have a very flat, shallow shelf. If you go out 12 miles here, you are lucky if you have a depth, I am not sure exactly but it is less than 100 feet, maybe 60 or 70 feet like on the New York Bite, but on the west coast, we have a relatively deep ocean. If you go 12 miles off Los Angeles, you are in 2,000 feet of water instead of 60 to 100 feet of water. The shelf is narrow. It drops deeply and we have a lot of flushing capability and a lot of currents.

So we can sum it up and say, "Well, the people who sit in Washington tend to give us too much for ocean pollution control and too little for air pollution control. They see how the atmosphere works and how the air pollution control works from the east coast point of view rather than from the west coast."

I will be happy to answer your questions.

Mr. ROE. Thank you very much for your testimony.

Do any of your colleagues have comments to make?

Ms. BERRY. I have a very brief statement.

I am Jan Berry, assistant director of the San Francisco program. I appreciate also the opportunity to speak with you today on the subject of H.R. 3282. Dr. Brooks outlined the concerns that San Francisco has with two rather limited and specific portions of this legislation. While I share those concerns and will address them from a slightly different angle, I am also here to assure you that San Francisco residents and its political leadership are firmly in support of the overall thrust of the Clean Water Act. We very much desire to see it continue and see the protective measures that it contains continued and we want to work with you in any way that we can to achieve the environmental benefits that should, by all rights, accrue.

San Francisco has earned a reputation for being an environmentally sensitive and aware area. Some have called us fanatics, but we are after all surrounded by water on three sides. We have made, in cooperation with other municipalities and the State of California, some great strides in protecting and preserving San Francisco Bay particularly and also the ocean waters of the Golden Gate and just to the west along our shoreline.

We have no interest in degrading the ocean waters anymore than we have in degrading the bay waters. Citizens in all sections of our cities, including the most impoverished areas, are very strongly in agreement that we have much to gain by participating in the clean water grants construction program.

San Francisco has been embarked since 1973 on a $1.3-billion sewer construction program that has three basic purposes. One is to upgrade the level of treatment from primary to secondary. Second, in some areas on the bayside to control combined sewer overflows in a marine estuary—and I would remark if it is raining anything like this in San Francisco, we definitely are polluting San Francisco Bay; and third, to shift the discharge from San Francisco Bay to 4½ miles offshore in the Pacific Ocean. This construction program is reviewed periodically to make sure that we are indeed

meeting all Federal requirements and will attain Federal requirements for water quality control and are able to keep costs in control in these limited resource times.

Standards have to be met in a fiscally responsible way and that is what we are trying to design our program to do. We are trying to hit the most important problems with the resources we have at the time. At this time we have achieved 73 percent of our environmental goal at about 42 percent of our anticipated costs. By 1986, with the construction programs we have underway, we anticipate being able to achieve approximately 93 percent of our environmental goal at about 58 percent of our anticipated costs. These percentages are based on actual volume of sewage flow that is captured and taken to our treatment plants for treatment.

The remaining tasks that we have which will take the rest of the money are to correct an acute combined sewer overflow problem and to shift our discharge locations to the ocean. These are costly parts of the problem and we are addressing them at a time of severely restricted financial resources here at the Federal level and of course in California and San Francisco specifically.

It is absolutely essential for us to focus our financial resources and our technical energies on our most important problems or we will fail a goodly number of our citizens.

As Dr. Brooks has pointed out, San Francisco isn't based on the kind of industry that creates a toxics problem and we are controlling what we do generate with an existing pretreatment program instituted 10 years ago. To control pathogens without chemical disinfection, we are constructing a $180 million, 4½-mile-long high dilution outfall. The added expense of a midcourse correction, if you will, when it really cannot enhance our environmental position is very difficult for me to justify in Bayview, Hunters Point, and in other areas which are concerned about the combined sewer overflow problem.

When the 301(h) waiver program was adopted, everyone expected western cities would apply and be successful in demonstrating adequate environmental protection. We are continuing to submit technical information to EPA on our own particular application. I assure you that even if resources were unlimited in San Francisco, we would be here today to discuss with you our concerns about requiring chemical disinfection across the board.

I assure you also that what we desperately need, in San Francisco at least, is continued and additional funding for the correction of combined sewer overflows into San Francisco Bay.

I am grateful for your time. If you have questions of myself on our overall program or of Dr. Brooks on the technical aspects of the ocean outfall, we would be very glad to answer those and I have some graphics, too.

Mr. ROE. Very fine.

Are there any other comments?

Dr. BROOKS. I would be glad to introduce into the record the latest draft ocean water quality control plan for ocean waters of California which does indicate a stringent control of trace contaminants which in most instances is stricter than EPA's.

Mr. ROE. No objection. So ordered.

[The information follows:]

WATER QUALITY CONTROL PLAN FOR OCEAN WATERS OF CALIFORNIA

INTRODUCTION

In furtherance of legislative policy set forth in Section 13000 of Division 7 of the California Water Code (Stats. 1969, Chap. 482) pursuant to the authority contained in Section 13170 (Stats. 1971, Chap. 1288) the State Water Resources Control Board hereby finds and declares that protection of the quality of the ocean* waters for use and enjoyment by the people of the State requires control of the discharge of waste to ocean waters in accordance with the provisions contained herein.

This plan is applicable, it its entirety, to point source discharges to the ocean. Nonpoint sources of waste discharges to the ocean are subject to Chapter I - Beneficial Uses, Chapter II - Water Quality Objectives, Chapter III - General Requirements, Chapter IV - Table B (wherein compliance with water quality objectives shall, in all cases, be determined by direct measurements in the receiving waters), and Chapter V - Discharge Prohibitions.

This plan is not applicable to discharges to enclosed* bays and estuaries* or inland waters nor is it applicable to vessel wastes, or the control of dredging spoil.

Provisions regulating the thermal aspects of waste discharged to the ocean are set forth in the Water Quality Control Plan for the Control of Temperature in the Coastal and Interstate Waters and Enclosed Bays and Estuaries of California.

Chapter I
BENEFICIAL USES

The beneficial uses of the ocean waters of the State that shall be protected include industrial water supply, recreation, esthetic enjoyment, navigation, and preservation and enhancement of fish, wildlife, and other marine resources or preserves.

Chapter II
WATER QUALITY OBJECTIVES

This chapter sets forth limits or levels of water quality characteristics for ocean waters to ensure the reasonable protection of beneficial uses and the prevention of nuisance. The discharge of waste* shall not cause violation of these objectives.

The Water Quality Objectives and Effluent Quality Requirements are defined by a statistical distribution when appropriate. This method recognizes the normally occurring variations in treatment efficiency and sampling and analytical techniques and does not condone poor operating practices.

---

* See Appendix for definition of terms

Compliance with the water quality objectives of this chapter shall be determined from samples collected at stations representative of the area within the waste field where initial dilution is completed.

A. Bacteriological Characteristics

1. Body-Contact Standards

Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline, and in areas outside this zone used for body-contact sports, as determined by the Regional Board, but including all kelp* beds, the following bacteriological objectives shall be maintained throughout the water column:

a. Samples of water from each sampling station shall have a concentration of total coliform organisms less than 1,000 per 100 ml (10 per ml); provided that not more than 20 percent of the samples at any sampling station, in any 30-day period, may exceed 1,000 per 100 ml (10 per ml), and provided further that no simgle sample when verified by a repeat sample taken within 48 hours shall exceed 10,000 per 100 ml (100 per ml).

b. The fecal coliform concentration based on a minimum of not less than five samples for any 30-day period, shall not exceed a log mean of 200 per 100 ml nor shall more than 10 percent of the total samples during any 60-day period exceed 400 per 100 ml.

The "Initial* Dilution Zone" of wastewater outfalls shall be excluded from designation as "kelp beds", and Regional Boards should extend the area of such exclusion zone where warranted. Adventitious assemblages of kelp plants on waste discharge structures (e.g. outfall pipes and diffusers) do not constitute kelp beds.

2. Shellfish Harvesting Standards

At all areas where shellfish* may be harvested for human consumption, as determined by the Regional Board, the following bacteriological objectives shall be maintained throughout the water column:

The median total coliform concentration shall not exceed 70 per 100 ml, and not more than 10 percent of the samples shall exceed 230 per 100 ml.

B. Physical Characteristics

1. Floating particulates and grease and oil shall not be visible.

2. The discharge of waste* shall not cause esthetically undesirable discoloration of the ocean surface.

---

* See Appendix for definition of terms

3. Natural* light shall not be significantly* reduced at any point outside the initial* dilution zone as the result of the discharge of waste.

4. The rate of deposition of inert solids and the characteristics of inert solids in ocean sediments shall not be changed such that benthic communities are degraded*.

C. Chemical Characteristics

1. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as the result of the discharge of oxygen demanding waste* materials.

2. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.

3. The dissolved sulfide concentration of waters in and near sediments shall not be significantly* increased above that present under natural conditions.

4. The concentration of substances set forth in Chapter IV, Table B, in marine sediments shall not be increased to levels which would degrade* indigenous biota.

5. The concentration of organic materials in marine sediments shall not be increased to levels which would degrade marine life.

6. Nutrient materials shall not cause objectionable aquatic growths or degrade indigenous biota.

D. Biological Characteristics

1. Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded*.

2. The natural taste, odor, and color of fish, shellfish, or other marine resources used for human consumption shall not be altered.

E. Radioactivity

1. Discharge of radioactive waste* shall not degrade marine life.

---

* See Appendix for definition of terms

Chapter III
GENERAL REQUIREMENTS FOR MANAGEMENT OF WASTE DISCHARGE TO THE OCEAN

A. Waste* management systems that discharge to the ocean must be designed and operated in a manner that will maintain the indigenous marine life and a healthy and diverse marine community.

B. Waste discharged to the ocean must be essentially free of:

1. Material that is floatable or will become floatable upon discharge.

2. Settleable material or substances that may form sediments which will degrade* benthic communities or other aquatic life.

3. Substances which will accumulate to toxic levels in marine waters, sediments or biota.

4. Substances that significantly* decrease the natural light to benthic communities and other marine life.

5. Materials that result in esthetically undesirable discoloration of the ocean surface.

C. Waste effluents shall be discharged in a manner which provides sufficient initial* dilution to minimize the concentrations of substances not removed in the treatment.

D. Location of waste discharges must be determined after a detailed assessment of the oceanographic characteristics and current patterns to assure that:

1. Pathogenic organisms and viruses are not present in areas where shellfish* are harvested for human consumption or in areas used for swimming or other body-contact sports.

2. Natural water quality conditions are not altered in areas* designated as being of special biological significance.

3. Maximum protection is provided to the marine environment.

Waste that contains pathogenic organisms or viruses should be discharged a sufficient distance from shellfishing and body-contact sports areas to maintain applicable bacteriological standards without disinfection. Where conditions are such that an adequate distance cannot be attained, reliable disinfection in conjunction with a reasonable separation of the discharge point from the area of use must be provided. Disinfection procedures that do not increase effluent toxicity and that constitute the least environmental and human hazard should be used.

---

* See Appendix for definition of terms

Chapter IV
QUALITY REQUIREMENTS FOR WASTE DISCHARGES (EFFLUENT QUALITY REQUIREMENTS)

This chapter sents forth the quality requirements for waste* discharge to the ocean*.

Table A limitations apply only to publicly owned treatment works and industrial discharges for which Effluent Limitations Guidelines have not been established pursuant to Sections 301, 302, 304, or 306 of the Federal Clean Water Act.

Table B limitations apply to all discharges within the jurisdiction of this plan.

Table A limitations, and effluent concentrations calculated from Table B limitations, shall apply to a discharger's total effluent, of whatever origin, except where otherwise specified in this plan.

The State Board is authorized to administer and enforce effluent requirements established pursuant to the Federal Clean Water Act. Effluent limitations established under Sections 301, 302, 306, 307, 316, 403, and 405 of the aforementioned Federal Act and administrative procedures pertaining thereto, are included in this plan by reference. Compliance with Table A limitations, or Environmental Protection Agency Effluent Limitations Guidelines for industrial discharges, based on Best Practicable Control Technology, shall be the minimum level of treatment acceptable under this plan, and shall define reasonable treatment and waste control technology.

TABLE A
MAJOR WASTEWATER CONSTITUENTS AND PROPERTIES

	Unit of measurement	Limiting Concentrations: Monthly (30 day Average)	Limiting Concentrations: Weekly (7 day Average)	Maximum at any time
Grease and Oil	mg/l	25	40	75
Suspended Solids		see below+		
Settleable Solids	mg/l	1.0	1.5	3.0
Turbidity	JTU	75	100	225
pH	units	within limits of 6.0 to 9.0 at all times		
Toxicity* Concentration	tu	1.5	2.0	2.5

---

* See Appendix for definition of terms

+Suspended Solids: Dischargers shall, as a 30-day average, remove 75% of suspended solids from the influent stream before discharging wastewaters to the ocean, except that when influent levels of suspended solids are below 240 mg/l the effluent limitations shall be 60 mg/l. Regional Boards may, with the concurrence of the State Board and the Environmental Protection Agency, adjust the lower effluent concentration limit (the 60 mg/l above) to suit the environmental and effluent characteristics of the discharge, and to provide for water* reclamation.

TABLE B
TOXIC MATERIALS LIMITATIONS

Effluent limitations shall be imposed in a manner prescribed by the State Board such that the concentrations set forth below as water quality objectives shall not be exceeded in the receiving water upon completion of initial dilution, except that limitations indicated for radioactivity shall apply directly to the undiluted waste effluent.

	Unit of Measurement	Limiting Concentrations 6-Month Median	Daily Maximum	Instantaneous Maximum
Arsenic	ug/l	8	32	80
Cadmium	ug/l	3	12	30
Chromium (Hexavalent) see below, a)	ug/l	2	8	20
Copper	ug/l	5	20	50
Lead	ug/l	8	32	80
Mercury	ug/l	0.14	0.56	1.4
Nickel	ug/l	20	80	200
Silver	ug/l	0.45	1.8	4.5
Zinc	ug/l	20	80	200
Cyanide	ug/l	5	20	50
Total Chlorine Residual	ug/l	2	11	126
(For intermittent chlorine sources, see below, b)				
Ammonia (expressed as nitrogen	ug/l	600	2400	6000
Toxicity* Concentration	tu	0.05	-	-
Phenolic Compounds (non-chlorinated)	ug/l	30	120	300
Chlorinated Phenolics	ug/l	1	4	10
Aldrin and Dieldrin	ug/l	0.002	0.004	0.006
Chlordane* and Related Compounds	ug/l	0.003	0.006	0.009
DDT* and Derivatives	ug/l	0.001	0.002	0.003
Endrin	ug/l	0.002	0.004	0.006
HCH*	ug/l	0.004	0.008	0.012
PCBs	ug/l	0.003	0.006	0.009
Toxaphene	ug/l	0.007	0.014	0.021
Radioactivity	Not to exceed limits specified in Title 17, Chapter 5, Subchapter 4, Group 3, Article 3, Section 30269 of the California Administrative Code.			

---

* See Appendix for definition of terms

a) Dischargers may at their option meet this limitation as a total chromium limitation.

b) Water quality objectives for total chlorine residual applying to intermittent discharges not exceeding two hours, shall be determined through the use of the following equation:

$$\log y = -0.33 (\log x) + 2.1$$

where: y = the water quality objective (in ug/l) to apply when chlorine is being discharged;

x = the duration of uninterrupted chlorine discharge in minutes.

Effluent limitations for substances identified in Table B with the exception of Radioactivity, shall be determined through the use of the following equation:

$$Ce = Co + Dm (Co - Cs) \qquad (1)$$

where:

Ce = the effluent concentration limit,
Co = the concentration to be met at the completion of initial* dilution,
Cs = background seawater concentration (see Table C below),
Dm = minimum probable initial dilution expressed as parts seawater per part wastewater.

The Executive Director of the State Board shall identify standard dilution models for use in determining Dm, and shall assist the Regional Board in evaluating Dm for specific waste dischargers. Dischargers may propose alternative methods of calculating Dm, and the Regional Board may accept such method upon verification of its accuracy and applicability.

---

* See Appendix for definition of terms

TABLE C
BACKGROUND SEAWATER CONCENTRATIONS (Cs)

Waste Constituent	Cs (ug/l)
Arsenic	3
Cadmium	0
Chromium (Hexavalent)	0
Copper	2
Lead	0
Mercury	0.06
Nickel	0
Silver	0.16
Zinc	8
Cyanide	0
Phenolic Compounds	0
Total Chlorine Residual	0
Ammonia (Expressed as nitrogen)	0
Toxicity* Concentration (in toxicity units)	0
Chlorinated Pesticides and PCB's	0

The six-month median effluent concentration limit shall apply as a moving median of daily values for any 180 day period in which daily values represent flow weighted average concentrations within a 24-hour period. For intermittent discharges, the daily value shall be considered to equal zero for days on which no discharge occurred.

The daily maxium effluent concentration limit shall apply to flow weighted 24-hour composite samples.

The instantaneous maximum shall apply to grab sample determinations.

Discharge requirements shall also specify effluent requirements in terms of mass emission rate limits utilizing the general formula:

$$\text{lbs/day} = 8.34 \times Ce \times q \qquad (2)$$

The six-month median limit on daily mass emissions shall be determined using the six-month median effluent concentration as Ce and the observed flow rate Q in millions of gallons per day. The daily maximum mass emission shall be determined using the daily maximum effluent concentration limit as Ce and the observed flow rate Q in millions of gallons per day.

Any significant change in waste* flow shall be cause for reevaluating effluent quality requirements.

If a calculated Ce value falls below the limit of detection of the test method specified in the Code of Federal Regulations, 40 CFR 136 the limit of detection shall serve as the limiting effluent concentration.

---

* See Appendix for definition of terms

The State or Regional Board may, at their discretion, specify test methods which are more sensitive than those specified in 40 CFR 136. Total chlorine residual is likely to be a "limit of detection" effluent requirement in many cases. The limit of detection of total chlorine residual in standard test methods is less than, or equal to, 20 ug/l.

Due to the large total volume of powerplant and other heat exchange discharges, special procedures must be applied for determining compliance with Table B limitations on a routine basis. Effluent concentration values (Ce) shall be determined through the use of Equation 1 considering the minimal probable initial* dilution of the combined effluent (in-plant waste streams plus cooling water flow). These concentration values shall then be converted to mass emission limitations as indicated in Equation 2. The mass emission limits will then serve as requirements applied to all inplant waste streams taken together which discharge into the cooling water flow, except that limitations on total chlorine residual, toxicity concentration, and radioactivity, as well as instantaneous maximum limitations on Table B toxic materials shall apply to, and be measured in, the combined final effluent.

Chapter V
DISCHARGE PROHIBITIONS

A. Hazardous Substances

The discharge of any radiological, chemical, or biological warfare agent or high-level radioactive waste into the ocean is prohibited.

B. Areas of Special Biological Significance

Waste* shall not be discharged to areas designated as being of special biological significance. Discharges shall be located a sufficient distance from such designated areas to assure maintenance of natural water quality conditions in these areas.

C. Sludge

Pipeline discharge of sludge to the ocean is prohibited by federal law; the discharge of municipal and industrial waste sludge directly to the ocean*, or into a waste stream that discharges to the ocean, is prohibited by this Plan. The discharge of sludge digester supernatant directly to the ocean*, or to a waste stream that discharges to the ocean without further treatment, is prohibited.

It is the policy of the State Board that the treatment, use and disposal of sewage sludge shall be carried out in the manner found to have the least adverse impact on the total natural and human environment. Therefore, if federal law is amended to permit such discharge, which could affect California waters, the State Board may consider requests for exceptions to this section under Chapter VI, F. of this Plan, provided further that an

---

* See Appendix for definition of terms

Environmental Impact Report on the proposed project shows clearly that any available alternative disposal method will have a greater adverse environmental impact than the proposed project.

D. By-Passing

The by-passing of untreated wastes containing concentrations of pollutants in excess of those of Table A or Table B to the ocean* is prohibited.

Chapter VI
GENERAL PROVISIONS

A. Effective Date

This Plan is in effect as of the date of adoption by the State Water Resources Control Board.

B. Waste Discharge Requirements

The Regional Boards may establish more restrictive water quality objectives and effluent quality requirements than those set forth in this Plan as necessary for the protection of beneficial uses of ocean waters.

Regional Boards may impose alternative less restrictive provisions than those contained within Table B of the Plan, provided an applicant can demonstrate that:

Reasonable control technologies (including source control, material substitution, treatment and dispersion) will not provide for complete compliance; or

Any less stringent provisions would encourage water* reclamation;

Provided further that:

a) Any alternative water quality objectives shall be below the conservative estimate of chronic toxicity, as given in Table D below, and such alternative will provide for adequate protection of the marine environment;

b) A receiving water toxicity objective of 0.05 tu is not exceeded; and

c) The State Board and the environmental Protection Agency concur in the Regional Board findings and alternative limits.

---

* See Appendix for definition of terms

TABLE D
CONSERVATIVE ESTIMATES OF CHRONIC TOXICITY

Constituent	Estimate of Chronic Toxicity (ug/l)
Arsenic	a) (notes below)
Cadmium	7.6
Hexavalent chromium	14.6
Copper	6.4
Lead	26.0
Mercury	1.6
Nickel	146.0
Silver	a)
Zinc	56.0
Cyanide	a)
Total Chlorine Residual	10.0
Ammonia	4,000.0
Phenolic Compounds (non-chlorinated)	a)
Chlorinated Phenolics	a)
Chlorinated Pesticides and PCB's	b)

a. There is insufficient data for arsenic, silver, cyanide, and phenolics to estimate chronic toxicity levels. Requests for modification of water quality objectives for any of these five waste constituents must be supported by chronic toxicity data for representative sensitive species. In such cases, applicants seeking modification of water quality objectives should consult the Regional Water Quality Control Board to determine the species and test conditions necessary to evaluate chronic effects.

b. Limitations on chlorinated pesticides and PCB's shall not be modified so that the total of these compounds is increased above the limitations in Table B (6-Month Median = 0.022 ug/l, Daily Maximum = 0.044 ug/l, and Instantaneous Maximum = 0.066 ug/l).

C. Revision of Waste Discharge Requirements

The Regional Board shall revise the waste discharge requirements for existing discharges as necessary to achieve compliance with this Plan and shall also establish a time schedule for such compliance.

* See Appendix for definition of terms

D. Monitoring Program

The Regional Board shall require dischargers to conduct self-monitoring programs and submit reports necessary to determine compliance with the waste discharge requirements, and may require dischargers to contract with agencies or persons acceptable to the Regional Board to provide monitoring reports.

Where the Regional Board is satisfied that any substance(s) of Table B will not significantly occur in a discharger's effluent, the Regional Board may elect not to require monitoring for such substance(s). Such election does not relieve the discharger from the requirement to meet the limitations of Table B.

The Regional Board may require monitoring of bioaccumulation of toxicants in the discharge zone. Organisms and techniques for such monitoring shall be chosen by the Regional Board on the basis of demonstrated value in waste discharge monitoring.

E. Areas of Special Biological Significance

Areas of special biological significance shall be designated by the State Board after a public hearing by the Regional Board and review of its recommendations.

F. State Board Exceptions to Plan Requirements

The State Board may, subsequent to a public hearing, and with the concurrence of the Environmental Protection Agency, grant exceptions to any provision of this Plan where the Board determines:

1. The exception will not compromise protection of ocean* waters for beneficial uses, and

2. The public interest will be served.

---

* See Appendix for definition of terms

APPENDIX

DEFINITION OF TERMS

CHLORDANE AND RELATED COMPOUNDS shall mean the sum of chlordane (cis + trans), trans-nonachlor, oxychlordane, heptachlor and heptachlor epoxide.

DDT AND DERIVATIVES shall mean the sum of the p,p' and o,p' isomers of DDT, DDD (TDE) and DDE.

DEGRADE: Degradation shall be determined by analysis of the effects of waste discharge on species diversity, population density, contamination, growth anomalies, debility, or supplanting of normal species by undesirable plant and animal species.

ENCLOSED BAYS are indentations along the coast which enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. This definition includes but is not limited to: Humboldt Bay, Bodega Harbor, Tomales Bay, Drakes Estero, San Francisco Bay, Morro Bay, Los Angeles Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay.

ESTUARIES AND COASTAL LAGOONS are waters at the mouths of streams which serve as mixing zones for fresh and ocean waters during a major portion of the year. Mouths of streams which are temporarily separated from the ocean by sandbars shall be considered as estuaries. Estuarine waters will generally be considered to extend from a bay or the open ocean to the upstream limit of tidal action but may be considered to extend seaward if significant mixing of fresh and salt water occurs in the open coastal waters. The waters described by this definition include but are not limited to the Sacramento-San Joaquin Delta as defined by Section 12220 of the California Water Code, Suisun Bay, Carquinez Strait downstream to Carquinez Bridge, and appropriate areas of the Smith, Klamath, Mad, Eel, Noyo, and Russian Rivers.

HCH shall mean the sum of the alpha, beta, gamma (lindane) and delta isomers of hexachlorocyclohexane.

INITIAL DILUTION is the process which results in the rapid and irreversible turbulent mixing of wastewater with ocean water around the point of discharge.

For a submerged buoyant discharge, characteristic of most municipal and industrial wastes that are released from the submarine outfalls, the momentum of the discharge and its initial buoyancy act together to produce turbulent mixing. Initial dilution in this case is completed when the diluting wastewater ceases to rise in the water column and first begins to spread horizontally.

20-955 O—84——152

For shallow water submerged discharges, surface discharges, and nonbuoyant discharges, characteristic of cooling water wastes and some individual discharges, turbulent mixing results primarily from the momentum of discharge. Initial dilution, in these cases, is considered to be completed when the momentum induced velocity of the discharge ceases to produce significant mixing of the waste, or the diluting plume reaches a fixed distance from the discharge to be specified by the Regional Board, whichever results in the lower estimate for initial dilution.

For the purpose of this Plan, minimum initial dilution is the lowest average initial dilution within any single month of the year. Dilution estimates shall be based on observed waste flow characteristics, observed receiving water density structure, and the assumption that no currents, of sufficient strength to influence the initial dilution process, flow across the discharge structure.

KELP BEDS are significant aggregations of marine algae of the genus *Macrocystis*. Kelp beds include the total foliage canopy of *Macrocystis* plants throughout the water column.

NATURAL LIGHT: Reduction of natural light may be determined by the Regional Board by measurement of light transmissivity or total irradiance, or both, according to the monitoring needs of the Regional Board.

OCEAN WATERS are the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. If a discharge outside the territorial waters of the State could affect the quality of the waters of the State, the discharge may be regulated to assure no violation of the Ocean Plan will occur in ocean waters.

SHELLFISH are organisms identified by the California Department of Health Services as shellfish for public health purposes (i.e. mussels, clams and oysters).

SIGNIFICANT difference is defined as a statistically significant difference in the means of two distributions of sampling results at the 95 percent confidence level.

TOXICITY CONCENTRATION: This parameter shall be used to measure the acceptability of waters for supporting a healthy marine biota until improved methods are developed to evaluate biological response.

a. Toxicity Concentration (Tc)

Expressed in Toxicity Units (tu)

$$Tc\ (tu) = \frac{100}{96\text{-hr. } TLm\%}$$

b. Median Tolerance Limit (TLm%)

TLm (percent waste giving 50% survival of test organisms) shall be determined by static or continuous flow bioassay techniques using standard test species. If specific identifiable substances in wastewater can be demonstrated by the discharger as being rapidly rendered harmless upon discharge to the marine environment, the TLm may be determined after the test samples are adjusted to remove the influence of those substances.

When it is not possible to measure the 96-hr. TLm due to greater than 50 percent survival of the test species in 100 percent waste, the toxicity concentration shall be calculated by the expression:

$$Tc\ (tu) = \frac{\log\ (100 - S)}{1.7}$$

S = percentage survival in 100% waste.
If S > 99, Tc shall be reported as zero.

WASTE: As used in this Plan, waste includes a discharger's total discharge, of whatever source.

WATER RECLAMATION: The treatment of wastewater to render it suitable for reuse, the transportation of treated wastewater to the place of use, and the actual use of treated wastewater for a direct beneficial use or controlled use that would not otherwise occur.

Mr. ROE. Let me just ask one question of Ms. Berry. You mentioned that the San Francisco program is about $1.3 billion?

Ms. BERRY. $1.3 billion, right.

Mr. ROE. That $1.3 billion is your estimated cost of production?

Ms. BERRY. Right.

Mr. ROE. Does that include the elimination of the combined sewer problem?

Ms. BERRY. Yes, it does.

Mr. ROE. Do you know offhand how much of the $1.3 billion relates in cost?

Ms. BERRY. Yes, I do.

In the southeast sector of the city, which is our most difficult problem for combined sewer overflows, we have about $118 million total. That is broken down, however, into much smaller segments, about $20 million to $30 million each because there is a series of little coves in that area. Each small project that we do gives an immediate environmental benefit for the neighbors in that area. We have tremendous odor problems. We only get about 20 inches of rain in San Francisco in a year and we have a lot of days when it rains and the next day it is very sunny.

The odor is unbelievable. It is a very shallow and very slow-moving area inside San Francisco Bay. We have addressed and corrected the combined sewer overflow problems up along the northern part of the city in the Fisherman's Wharf area and around to the Golden Gate, but we have that area in the slower moving part of the bay that we need to address.

Mr. ROE. And it is $118 million.

Ms. BERRY. For the whole program.

Mr. ROE. Has EPA approved your plan for the removal of the combined sewer situation?

Ms. BERRY. Yes. What we are moving through are the environmental review periods right now. We are going through our own board of supervisors next week to get their adoption of the environmental review documents and our application for the first part of our program will be submitted to the State and EPA after that time.

Mr. ROE. Did EPA approve your step 1 overall program?

Ms. BERRY. Yes.

Mr. ROE. Are they going to fund the elimination of combined source?

Ms. BERRY. If they approve our application, they will, but the application is not to be submitted yet. We are waiting for the issuance of Federal guidelines on the CSO grant program which we expect out in December. At that point, we will submit our application. It should be due in March or April.

Mr. ROE. The other thing I think we ought to be checking on is the moving in the other body.

Ms. BERRY. I might mention that the GAO report that came out earlier this year, they looked at our program very intently and they were convinced that the CSO problem was one very worthy of being addressed in San Francisco and supported that in full. EPA's review panel last year also reviewed the program in full and said that it would be a very worthy addition.

Mr. ROE. If there are no further statements, are there any questions?

Mr. EDGAR. Thank you, Mr. Chairman.

I just have one question. Have you had any analysis of the cumulative effect on the ocean if all major cities adopted the plan that you have suggested of ocean dumping?

Dr. BROOKS. Yes. In southern California, there is an organization, the southern California coastal water research project, which covers the area from Orange County, Los Angeles County, and city and Ventura County and has the specific purpose to view the regional water quality and it is a field far away from the individual discharge. There is an excellent program which shows that the southern California Bight is assimilating the waste from these outfalls very well.

Mr. EDGAR. There is no cumulative or expotential growth of the materials?

Dr. BROOKS. No, because the ocean is dynamic. The water in this southern California Bight—and I will get back to San Francisco in a minute—exchanges every 3 months or so. In other words, there are currents coming through. There are eddies that mix this water with deep ocean water so that the water just doesn't hang around there like in the Chesapeake Bay or the New York Bight. It is moving through.

So when you add this oxygen-demanding waste, it mixes with the ocean water to such a high degree that it can be assimilated along with the waste products of the ocean itself.

There are locally some effects.

Mr. EDGAR. So what you are saying is that you are replacing the water in the area and the pollutants are being washed away someplace.

Dr. BROOKS. That is correct.

Mr. EDGAR. The question I am asking is over time does that build up so that the replacement water comes in not as fresh and clean?

Dr. BROOKS. One of the numbers I like to use is the plankton in the southern California Bight produce as much organic carbon waste as 500 million people. The ocean is already a big biological kettle. Most of the problems are due to the fact that urban areas probably discharge their waste into too small an area. If you have a rapidly flushing ocean and you get out there far enough to get with it, then you can put these ecosystem products back in the ocean just like recycling land. It puts nutrients back in. You don't want to put toxics into the ocean. Don't misunderstand me. Toxics you ought to control to the very level that you need to in order to avoid any effect in the ocean.

In San Francisco, there are no other discharges anywhere in the region which would have any overlapping effects. There is a very small one down the coast at Pacifica, but most of the discharges are inside San Francisco Bay like Oakland and so on. But the currents in San Francisco are stronger than any other outfall I have worked on.

Mr. ROE. You speak to the ocean as being dynamic and then we speak to the issue that there is not that much of a toxic intrusion in the present economic posture, if you like, of the area.

Dr. BROOKS. Yes.

Mr. ROE. Does San Francisco or its surrounding communities, if they have some kind of a program coming in that may produce the toxic issue, do they have to get a special permit or clearance before they are allowed to dump it?

Dr. BROOKS. Absolutely. The California ocean plan is very strict. You simply may not discharge and I just gave you my copies. There is a whole list of about 20.

Mr. ROE. We don't have time to go into any detail. All I am trying to get at is, is there some special law in California that affects San Francisco that says that if anybody wants to come in there and build any type of manufacturing process or whatever, that they have to get a special clearance from I guess it is the sewage authority in the area?

Dr. BROOKS. Absolutely.

Ms. BERRY. There is the regional water quality control board.

Mr. ROE. They have to get a permit from them?

Ms. BERRY. Absolutely.

Dr. BROOKS. It is very tight.

Mr. ROE. Mr. Edgar?

Mr. EDGAR. Mr. Chairman, I don't have any further questions.

I just want to be sure that we understand the difference from the west coast and the east coast as you tried to point out to us and I appreciate your answer.

Ms. BERRY. If I may add just one very brief point, when San Francisco was initially looking at the ocean outfall, we participated under State auspices in a 2-year research study in the ocean and hired outside consultants for that because city staff are not oceanographers. It is a thick research project. I did not bring it with me today, but it has ended up being a very valuable study statewide to show the kinds of bacterial organisms and the transport of the effluent in the area so the outfall was not done without a great deal of research in advance.

Mr. EDGAR. Thank you.

Mr. STANGELAND. Dr. Brooks, I think you alluded to it, but as Mr. Edgar brings out, you did not really specify. I think what you are telling us is there ought to be two sets of rules, regulations, requirements for water quality standards east to west; that you should not be discussing the same standard with both; is that right?

Dr. BROOKS. Not quite. You may have the same water quality standard but the end result that you want in the ocean, you want to be very good. You want to control water quality, OK. You can set the same number for bacterial requirements for water used for swimming and shellfish. Those can be the same east and west.

But the point is, what you have to do in a cost effective way to achieve those numbers is a different technology in the west than it is in the east.

Mr. STANGELAND. They are the same standards, then, but different requirements to meet those standards, different methodologies?

Dr. BROOKS. I think California's approach is that they do not specify the technology. They say, here is the water quality that we want to come out as a result.

This is the whole philosophy of the 301(h) waiver. We demand that the waiver applicant produce documentation to prove that the

water quality will be maintained in excellent characteristics, and then the discharger is allowed some flexibility in the mix that he derives from treatment, pretreatment, and outfall location and mixing. In other words, balancing the ocean and the treatment in an overall system to achieve the required result. That is the cost effective way to do it.

If you just say build this secondary treatment plant or chlorinate, then you are sort of telling people to do things which in some places may be just throwing your money away because there may be a much cheaper way to get the same water quality.

Do you see what I mean?

Mr. STANGELAND. Yes.

Dr. BROOKS. OK.

Mr. STANGELAND. You expressed concern for excessive pretreatment requirements for a 301(h) waiver. Will you agree that a local pretreatment program of some sort is an appropriate requirement in industrial areas?

Dr. BROOKS. Absolutely. But again, my point is that you ought to be deriving your concern from the water quality and you may end up with different pretreatment programs for different areas depending on what the ocean is like in order to have a safe maintenance of high water quality.

So if you are a heavy industry in Chesapeake Bay, you are going to have a lot of different pretreatment needs than if you are a small industry on a big ocean or in Hawaii maybe.

Mr. STANGELAND. How do you evaluate San Francisco's pretreatment program and how essential has it been?

Dr. BROOKS. Well, I think it is absolutely essential. I think every major city must have a pretreatment program.

Now, the problem of pretreatment programs is that it would be nice if you could shut off all these toxics down to zero but in the environmental business, there are no zeros. There are only some point zero zero. There are always some numbers left.

So the problem is that to get down to very low numbers on some things, it takes an extraordinary amount of effort, both in regulation and in technical measures, and therefore you ought to be guided by what you need to do in order to produce good water quality so that you don't spend an excessive amount of money being extremely stringent on some things where you have got some other environmental problem over here which you could spend your money on much more efficiently.

Ms. BERRY. Our pretreatment program is, by the way, approved by EPA. We have had it in existence for about 10 years.

Dr. BROOKS. I might also say that the discharge from the Richmond sunset plant that will go into the new outfall will, according to the California ocean plan, meet the toxic substances requirements of the ocean plan by a factor of 5 to 400 times better than the existing pretreatment program has already achieved, projected from the time the plant starts up compared to the California ocean plan.

They are already way below the California ocean plan and that is why the concern about this other language. If you are only going to have primary treatment, you have to predict what it would have

been if you had secondary and pretreatment programs, a lot of second-guessing which does not give you water quality.

Mr. STANGELAND. Ms. Berry, if I understand correctly, you said that you will have expended 52 percent of your moneys for your program and at that point, you will have achieved 93 percent of your goals. Will it be cost effective to spend the other 48 percent to achieve that last 7 percent of your goals?

Ms. BERRY. It is 93 percent of our goals based on a volume of sewage that is collected and treated. If you measure goal attainment by the correction of discharge, then we are not meeting that high a level because we do still need to get bayside flows out to a higher dilution area.

It is like any environmental program. I worked in air quality before I came to the water quality program 4 years ago. It is that last 7 percent that seems to kill you on the budget line. We will be up to about the 58-percent level in terms of cost but we will be much above that in terms of environmental achievement, except for those last two tasks.

We see the key part being the CSO problem that is inside the bay and even that cost does not bring us anywhere near the $1.3-billion level, but to meet all Federal standards would cost the additional amount and our citizens would prefer to do it that way. They have voted twice now to approve the local share of that size of program.

Mr. STANGELAND. Thank you.

No further questions.

Mr. ROE. Are there any further questions of these witnesses?

The gentleman from Wisconsin.

Mr. MOODY. Yes, thank you.

I was interested in your comments about CSO. My city of Milwaukee has a CSO problem too. A number of the older cities do.

How are you funding your CSO cleanup?

Ms. BERRY. We are participating in the clean water construction grants program, so we have solved about 50 percent of the problem using the combination of 75 percent Federal funding and 12½ percent local and 12½ percent State.

We are using a system of reservoirs and transport storage facilities that are built around the perimeter of San Francisco to capture the flow as it comes down to the shore line and hold it for a few hours and take it gradually to the treatment plant.

Mr. MOODY. Store, convey, and treat.

Ms. BERRY. Yes.

Mr. MOODY. You said as it gets to the shore line. You mean runoff, not outfalls?

Ms. BERRY. We have a combined system so ours comes through 900 miles of sewer system. We have a very steep topography so it comes at us in a huge rush, great volume at one time, so we have these huge transport storage facilities to catch that and hold it for a while.

Mr. MOODY. My question is really on funding. Did you get any special grants or special money?

Ms. BERRY. No, not at this time. Our funding has come through the regular clean water construction grants program to this point.

At this point now we are putting together the application for the special CSO fund. Congress had authorized up to $200 million annually for marine estuary areas with CSO problems, and we are the only city in California that is eligible for that particular special fund.

Mr. MOODY. You are the only city in the country, aren't you?

Ms. BERRY. No, just on the west coast. Many of the east coast cities have that problem as well. It is the older cities with the old sewer systems.

Mr. MOODY. That are on marine estuaries?

Ms. BERRY. Marine estuaries, right.

Mr. MOODY. Do you think there is a special reason why we should have a fund that is for marine estuaries as opposed to inland water bodies?

Ms. BERRY. I am not sure that I am the best person to answer that particular question.

Mr. MOODY. I want to get back to your cost-benefit issue. You are achieving 93 percent of your goal in this particular area with 58 percent of your funds.

Ms. BERRY. Yes.

Mr. MOODY. In a universe of scarce resources, if we push ourselves to 100-percent achievement and use up that extra money for relatively minor additional gains in cleanliness, aren't we in danger of not cleaning up other areas where we could get much more bang for the buck?

Ms. BERRY. There is that potential. That is why we divided our programs into five separate systems and are approaching them incrementally, so we do get the benefit as long as the money is available.

Mr. MOODY. Do you do that simultaneously so you don't spend up all your money on one thing?

Ms. BERRY. We want high volume.

Dr. BROOKS. Let me make a comment. I think the 100 percent she is referring to are the goals of the master plan.

For example, the master plan for Pacific Ocean discharge was modified and I think includes, hopefully, the approval of a 301(h) waiver from secondary treatment. So we are trying to make a cost-effective system to get the environmental growth which does not include every possible thing you could do like secondary treatment.

The problem of San Francisco technically is especially difficult because of the combined sewer problem and the wet weather that goes with it. Still, often the debate is how much treatment to give the wet weather flow if you can convey it out to long outfall. This would count as achieving a large measure of success.

So I think, don't interpret her percentages too literally because it is hard to express what quality goals are.

Mr. ROE. Will the gentleman yield?

Mr. MOODY. Yes.

Mr. ROE. You are not saying, however, that in order to achieve the goals, of which one priority is cleaning up that bay, that if you don't deal with the combined sewer situation you can't achieve that goal?

Ms. BERRY. That is absolutely right.

Mr. ROE. I think that is the point the gentleman ought to stress.

When we had the battle in the last 1981 amendments in the quarrel there, we tried to get across to some of those who don't understand the issue that just because it is effective in an estuary, that is one thing, but you have that same problem in inland waterways throughout the West of the country.

So there is no magic in saying this is the problem over here in San Francisco, or for that matter, in Boston, if you don't handle it in the entire country.

We believe that the elimination of the combined sewers overflows—and I was just reflecting, as Ms. Berry was testifying, is really analogous to the point of view of your nonpoint source, and what you are saying fundamentally in the topographical relationship of San Francisco in view of the fact that you are including the elimination of the combined sewer issue you are picking up urban runoff and everything else.

Ms. BERRY. That is exactly right.

Mr. ROE. So in effect, your program is not only directing itself to point source elimination. You have taken a geographical environment and you are also handling the nonpoint source.

Ms. BERRY. That is right.

Mr. ROE. So the advantage of the process that they are able to use in the storage and elimination of that combined runoff has an enormous effect upon what you are trying to achieve as far as that area is concerned? Is that a fair commentary?

Ms. BERRY. Yes.

Mr. ROE. There is no reason to believe that that same set of circumstances does not exist everywhere else.

Mr. MOODY. If I could have a little more time. Have you investigated the cost benefit relationships of instead of storing it, conveying it, and treating it. That given the rapid and high velocity flushing operation naturally of the Pacific Ocean, instead of conveying it to the storage plant and treating it, is there a way to convey it out some great distance beyond the Golden Gate where that natural flushing would just take it away?

Ms. BERRY. The location of the area where we are having the problem is the furthest away from the ocean side. The treatment plant is closer to us.

Mr. MOODY. So you are on the peninsula.

Dr. BROOKS. Let me answer this. I worked on the engineering aspects of this question.

What you are trying to do is to convey the storm water instead of discharging it into the bay to get it out into the ocean. You are exactly right.

To me it is more important to get it far offshore and into the ocean than to worry about the 4 percent of the time and treat it and so on. Just get it out there.

Now, the problem is that the volumes are so large that to take it instantaneously out to the ocean would require several hundred million dollars more of pipes. So after storing it, just to help, you then pump it out there.

Mr. MOODY. So storing it would happen in either instance whether you convey it to the treatment plant or the Pacific Ocean?

Dr. BROOKS. Yes. It is just an economical way to do it.

Mr. ROE. If the gentleman would yield again.

It seems that their testimony is based upon the application of varying processes to a given set of environmental problems and to an environmental result.

Dr. BROOKS. That is correct. We share the objectives.

Mr. ROE. But therefore, in the comparative relationships, however you best do that in San Francisco, to achieve that goal, one thing you have recognized, which I think is the point the gentleman is leading to, that in order to achieve that goal at all, you must deal with the elimination of those combined sewers.

Dr. BROOKS. Well, you do the best you can.

Mr. ROE. I don't want to hedge and fudge. You either do or you don't.

If we are going to submit an application for the aggregate cost of one point, whatever billion, do you consider the elimination—and this is a very critical point here—do you consider the elimination of the combined sewers as a very critical factor in your overall water quality program for San Francisco, not how you do it?

You are able to go out because you have a 1,000 foot depth and you are off the coast. We understand. We have been doing this for 5 years.

I just want to get that on the record as being a fact. We are trying to convince the Congress that if they don't do something to eliminate the combined sewers overflows there is no sense in wasting our time on nonpoint source. Is that one and the same? Do you understand what I am saying technically?

Dr. BROOKS. Yes, I agree. The elimination of combined sewer overflows can be done as in San Francisco, or can be done by building separate sewer systems. There are different ways to do it.

Mr. ROE. That is what I am trying to get at.

Dr. BROOKS. The 100-percent efficiency, though, is very difficult to prevent any combined sewer overflow and San Francisco had a lot of debate over how much to reduce the combined sewer overflow, whether to reduce 95 percent or 99 percent.

Mr. ROE. Excuse me. We are not going to solve all our problems today.

Please don't consider me rude. Out of the testimony you are developing, particularly issues which relate to the west coast which we are aware of, this committee had to make a decision at one occasion which was supported by the environmentalists on a very similar problem on the west coast having to do with a paper mill. So we are a little bit knowledgeable on what you are talking about.

What I am trying to get at is, when the national clean water people and different ones have testified they have come back to us and said, "We like the bill, and we want to look to the Oberstar aspects that he has introduced, because then we start to deal with nonpoint source."

What I want to try to get into the record is that if you are going to be dealing with nonpoint source in any urban area that has a combined sewer, you must direct your attention to that issue as an equal level of potential improvement of anything else.

Consequently, therefore, to achieve that goal, if they come back to you—and if the gentleman would further yield, from Wisconsin—they came back and said, "OK, fine, you are not going to provide the estuarine waters. It is going to cost you $118 million and

you have to raise that locally as reducing the cost from 75 percent down to 55 percent." Giving some States the right, the Governor decides, "I am not going to go with 65 percent. I am going to decree 55 percent." All has a bearing on your electorate. Is that fair? What are your costs going to be, et cetera, et cetera.

All I am trying to establish is in the San Francisco problem, above and beyond the integrity that you developed to go out into the deeper ocean, which is the point you are making, in order to do the job cost effectively, we must get rid of the combined sewer.

Is that a true or untrue statement?

Ms. BERRY. That is absolutely true.

Another way to look at the percentages, as I mentioned, the 93 percent relates to sewage flow or volume. You can also look at it in terms of population effected.

The combined sewer problem that we have is down in this corridor of the city, so you are affecting 30 to 35 percent of San Francisco's population with an esthetic problem, an odor problem and health hazard.

There is a brand new State park developed along this entire shoreline from the San Mateo County border around the entire southeast area up to the creek where our treatment plant is located. That section, if you will forgive an old fisherman's term, will chum a lot of people to that area. They will be wading and swimming and surfboarding, windsurfing, and taking shellfish from an area that is highly polluted and has been for a long, long time.

Mr. ROE. Are there further questions?

Mr. STANGELAND. Mr. Chairman, I ask unanimous consent that I might be allowed to submit some written questions to the witnesses.

[The questions submitted to Dr. Brooks by Representative Stangeland, and responses received follow:]

NORMAN H. BROOKS, PH.D.
CIVIL ENGINEER
1201 EAST CALIFORNIA BOULEVARD
PASADENA, CALIFORNIA 91109

February 15, 1984

FEB 17 1984

Congressman Arlan Stangeland
House of Representatives
1526 Longworth House Office Building
Washington, D.C. 20515

Dear Mr. Stangeland:

In response to your letter of January 17, 1984, I am pleased to transmit herewith my responses to your follow-up questions for my testimony on November 10, 1983 before the Water Resources Subcommittee.

If there are any other questions, I'll be pleased to address them also.

Sincerely yours,

Norman H. Brooks

Norman H. Brooks
Director

NHB:mn

cc: Mr. Lou Vagadori
City and County of San Francisco

Answers to questions from Congressman Stangeland (Jan. 17, 1984)
for City and County of San Francisco,
related to testimony before the
Water Resources Subcommittee on November 10, 1983.

Answers by Norman H. Brooks

1. Question: Toxics discharges are of great concern. Where a discharge under 301(h) was shown to have negative impact on the ocean due to toxics, would you support modification or cancellation of such a discharge?

Answer: Absolutely yes. The negative impacts of toxic substances must be controlled in all environmental media, including air, ground water, surface water, and the land as well as the ocean. The important point of my testimony was that society's efforts on source control (or pretreatment) must be focused on substances which need to be controlled for maintaining excellent ocean water quality and not dissipated on non-problems. Therefore the best way to set priorities and regulations for source control is to establish criteria to be met for ocean water quality in the vicinity of outfall discharges. This is the approach of the California Water Resources Control Board which is widely accepted and being copied in many other locations worldwide. (Reference:)

2. Question: You have discussed the subject of disinfection. There has been concern raised by environmental groups that chlorination may have serious impact on the receiving waters. Would you still support treatment for pathogens by chlorine or other means where there may be a public health threat?

Answer: Protection of public health and the maintenance of a healthy marine ecosystem are both important goals of marine disposal systems. Wherever feasible, I recommend that outfalls be long enough and deep enough so that even without chemical disinfection, there is sufficient natural dieoff and dispersion of pathogens to eliminate human exposure (either by bathing or eating shellfish). (This is the policy of the California Ocean Plan.) However, where it is not feasible to control pathogens this way, I definitely would recommend some form of disinfection. The possible adverse effects can be reduced, however, by: (1) applying disinfection only during the seasonal periods when it is needed (based on oceanographic conditions and human exposure); (2) in the case of chlorination providing an additional treatment step known as dechlorination to remove all chlorine residuals and (3) use of high dilution outfall diffusers obtaining dilutions of over 100:1 (parts of sea water per part of effluent).

The Southwest Ocean Outfall of the of the City and County of San Francisco, now under construction, has been designed to meet all bacterial standards of the State of California without disinfection.

3. Question: How will San Francisco's pretreatment problem be impacted by EPA's National Categorical Standards?

Answer: San Francisco can meet EPA's National Categorical Standards through additional controls on industrial dischargers. However, the program already in effect produces effluent which will meet all toxic substances requirements ("Table B") of the California

Ocean Plan as applied to the high dilution San Francisco Southwest Outfall. Since the California requirements are widely regarded as being conservatively set (based on the scientific literature on toxicity to marine organisms), I regard the application of the national EPA standards as being in excess of what is needed in San Francisco to maintain excellent ocean water quality.

As explained in my testimony, the approach to regulation of toxics as set forth in the draft legislation (H.R. 3282, Sec. 5(b)) is completely unworkable administratively, and is not based on any scientific data on toxicity.

Mr. ROE. Now, there is no further question of these distinguished witnesses from San Francisco.

We just had a vote come up.

Dr. BROOKS. One final comment. I would like to agree with what you said, but put it in the following context. If you have diffuse sources like tire dust or lead from gasoline, and how it gets to the ocean or an estuary is an accident of how a city is constructed. In Los Angeles, it washes down into the flood control system and runs out in the ocean in the flood channel. In San Francisco, it runs down to the sewer and runs out of the sewer system. You have to tackle all the ways that those diffuse sources can get to the ocean to tackle that problem.

Mr. ROE. What I am leading up to, we are going to battle this battle again. Make no mistake, and I am very candid about it. And hopefully we can get some of the Senators—I shouldn't say this, but it has got to be said, and I say what I think. We have got to get some of the Senators that are governing from the interior States of this Nation to get involved in this and not just those in the coastal areas talking about setting up estuary areas. It affects the whole country.

Have you something further to add?

Dr. BROOKS. On the pretreatment, I think the language of the Senate bill is satisfactory from a scientific point of view.

Mr. ROE. We will surely take a look at it.

We are on a rollcall vote.

Let me suggest the following to the folks that are from throughout the country and going to testify today. We have two critical measures on the floor of the House. One is obviously the continuing resolution if the country is going to continue to function. There is no way for the committees to determine how the votes are going to fall. There is one vote up there now.

Because of another critical matter for the Members, particularly, that the full Committee on Public Works will meet 15 minutes after this vote in 2167 in an emergency meeting of the full Committee on Public Works. So that means we are going to be a little bit

delayed in our process. So I don't know how long our testimony is going to take of the different witnesses.

You came a long way and we are here to hear you, but we hate to tell you the bad news, that it is going to take longer than we thought, so you are not going to get on as early.

If you have airplane reservations, please start looking at them now because it will probably take a number of hours to conclude everything in the committee.

Having said that, in a few minutes we will get a second call on this vote.

We want to thank you, by the way, for a very substantive presentation. If we seem a little bit excited or enthusiastic or whatever in our response, it is because we are trying to nail down the law, too. So we thank you very much.

Mr. BROOKS. We would be happy to answer any further questions.

Mr. ROE. I don't think there are any. We will be presenting some to you in writing, as requested by the gentleman from Minnesota.

So I would suggest that what we do is recess now. And, Congressman Rahall, our next witness, will be from the West Virginia Chamber of Commerce, Mr. Don Hysell. If you would be kind enough to stand in ready.

We will go and vote, go to the full committee. And I would suggest that the subcommittee will have to recess at this point and return here at 12:30. That is an hour from now. At that point, we will hear Mr. Don Hysell, and he will be welcomed by Congressman Rahall from West Virginia.

So the committee will stand in recess. Please bear with us, ladies and gentlemen, until 12:30.

[Whereupon, at 11:30 a.m., the subcommittee recessed, to reconvene at 12:30 p.m., the same day.]

AFTERNOON SESSION

Mr. ROE. The committee will reconvene.

Our next witness scheduled for this afternoon is Mr. Don Hysell from the West Virginia Chamber of Commerce. We will hear from the distinguished Representative from West Virginia, the Hon. Nick Rahall.

Mr. RAHALL. Thank you, Mr. Chairman. I appreciate this opportunity to introduce to the committee the next witness.

Before I make this introduction, I would like to ask the subcommittee's permission to submit for the record two letters that I have received from the West Virginia Department of Natural Resources.

One letter from the director, Mr. Dave Callahan, expresses the department's views on legislation introduced by Congressman Oberstar to address the problem of nonpoint sources of pollution.

The other letter is from Warren Means, and states the needs for a strong construction grants program.

Mr. ROE. Without objection, so ordered.

[The letters follow:]

October 28, 1983

Congressman Nick J. Rahall, II
440 Cannon Building
Washington, DC 20515

Dear Congressman Rahall:

I have received copies of Representative Obe star's speech and H.R. 4037 and wish to thank you for thinking of me.

Non-point source pollution is certainly an area that needs our efforts at correcting. As administrator of the Section 201 program which deals with point source domestic pollution, I recognize that the two are both needed to complement each other and give us total pollution abatement.

I would, however, like to share with you our concerns over program changes to be in place after October 1, 1984. I refer to zero collectors eligibility and the reduction in grant eligibility from 75% to 55%.

In West Virginia almost all of our sewage facilities projects need collectors. Especially after over 11 years into PL92-500 it can be noted that we have completed funding almost all major population centers and only the rural areas remain, almost all of whom will require collectors. It can also be noted that the rural areas can least afford to pay for their own collector systems which usually constitute 50-60% of the total project cost.

Further, the reduction in grant levels of the remaining eligible categories from 75% to 55% will work additional hardships on those rural areas. The most difficult facet of the program now - and has always been - is the securing of local share matching funds. If we have had trouble matching 75% grants with 25% local share funds, imagine the difficulty of matching 55% grants with 45% matching funds.

We feel that the impact to W. VA. of these changes in the regulations will be very severe indeed. We had more or less realized that about the only program we would have after October 1, 1984 would be up-grading existing sewage treatment plants.

However, we understand that second-round grants may also be eliminated except on projects which have exceeded its (20 year) design life. We will recommend utilization of the Governor's 20% set-aside to fund ineligible categories for collectors and we will utilize as much Innovative/Alternative funds for pressure and vacuum collector systems as possible, but these will not begin to equal a continuation of funding at the previous 75% grant level.

My intention here is to alert you to these facts and solicit your help to change the program back to full eligibility and full 75% funding levels.

Thank you for bearing with me and being a good listener.

Sincerely,

DIVISION OF WATER RESOURCES

DEPARTMENT OF NATURAL RESOURCES
CHARLESTON 25305

JOHN D. ROCKEFELLER IV
Governor

DAVID C. CALLAGHAN
Director
WILLIS H. HERTIG, JR.
Deputy Director
BRENT T. WAHLQUIST
Deputy Director

October 25, 1983

The Honorable Nick J. Rahall, II
Congress of the United States
House of Representatives
Washington, D. C. 20515

Dear Congressman Rahall:

First of all, I'd like to express my appreciation for the opportunity to comment on an important piece of legislation in the long standing effort to improve and protect the nation's waters. The West Virginia Department of Natural Resources is vitally interested in protecting both the land and water resources of the state from unwarranted abuse and degradation.

As you know, West Virginia depends upon its natural resources, in large part, for its economic well-being. Although coal, oil and gas, agriculture, and timber provide thousands of jobs, those industries have the potential to seriously affect the quality of the state's waters and thereby threaten the integrity of the trout and warm water fisheries, drinking water supplies as well as our growing tourism industry.

Realistically addressing the relationship between natural resource development and protection can be a delicate and, at times, controversial undertaking. For that reason, it is encouraging to note the efforts being made to recognize the impact that nonpoint source pollution can have on water pollution control activities. A recent survey reported that nonpoint pollution accounts for 50 percent of the water quality problems in some areas of the state.

The basic premise of Mr. Oberstar's bill providing for state and local development of control programs with minimal federal oversight is an effective approach and one which should provide the flexibility to achieve positive success.

The State of West Virginia has been engaged in nonpoint pollution control programs for agriculture, forestry, construction and abandoned mines for four years. Under section 208, 303(e), and 305(b), a significant amount of work has been done in identifying major categories of nonpoint pollution and developing implementation programs to address

them. Federal, state and local agency involvement has been of tremendous assistance in both assessing the problems and implementing solutions. Continued cooperative efforts, with the additional funding provided for in Mr. Oberstar's bill, will no doubt be of extreme benefit to the nonpoint source water pollution control efforts currently underway. However, it may be pertinent to point out that a significant amount of money has already been expended in developing the programs we are currently implementing. Mr. Oberstar's bill provides funding to develop basically the same programs with minimal additional financial incentives for implementation. What is needed, therefore, is funding to provide for actual structural implementation of practices. This is addressed to some extent in provisions to correlate other federal funding sources with the nonpoint effort and also in the demonstration project concept, but to thoroughly address the problem, an adequate implementation incentive is needed. Education and technical assistance can achieve results, as we have found in our four year effort, but without funding support it is difficult to promote actual water quality protection through practice implementation.

In reviewing the provisions of the bill as currently written, it appears that our existing programs can be readily revised to accommodate the new requirements and additional implementation activities undertaken with minimal interruption. In fact, it is encouraging to note that this bill is not a wholesale restructuring of prior legislation but rather an extension of earlier efforts at addressing the complex problem of nonpoint source pollution.

Again, I feel this legislation to be of extreme importance and would like to offer any assistance you may require in insuring a successful outcome.

Sincerely,

David C. Callaghan
Director

DCC/wbh

cc: D. W. Robinson, Chief, Division of Water Resources

Mr. RAHALL. Our next witness is from West Virginia, Don Hysell, presently the director for Human Resources for BASF at the Huntington, W. Va., plant. Today Don is here representing the West Virginia Chamber of Commerce to express the chamber's views on what change they feel is needed in the Clean Water Act.

Don, on behalf of the committee, I want to welcome you and we certainly look forward to hearing your views. You may proceed as you wish.

TESTIMONY OF DON HYSELL, EMPLOYEE OF B.A.S.F. WYANDOTTE CORP., HUNTINGTON, W. VA., REPRESENTING THE WEST VIRGINIA CHAMBER OF COMMERCE

Mr. HYSELL. Thank you, Congressman.

Mr. Chairman, Congressman Rahall, distinguished members of the subcommittee, as I was introduced, my name is Don Hysell and I am from Huntington, W. Va. I am here today to comment on the Clean Water Act and in particular, the best available technology provisions.

According to authoritative sources, more than $1 billion have been spent by industry and Government on improving the quality of the Nation's lakes, rivers, and streams, and the effectiveness of these expenditures can be seen in the quality of our water resources in West Virginia and elsewhere.

Eli McCoy, water resources director of the West Virginia Fish and Game Office, has said, "There are more species of fish seen in the Ohio River today, and especially more desirable game species."

An Ohio River fishery survey conducted by the EPA and the Ohio River Valley Water Sanitation Commission, in June of 1978, states, "Species appear to be increasing in abundance in the upper 100 miles of the Ohio River, including the channel catfish, skipjack herring, and spotted bass. Also, individual sample collections indicate that the paddlefish and buffalofish may be extending their range and/or increasing from the lower Ohio into the middle section of the river."

I believe as many of my West Virginia colleagues do, that it is time for the Congress to make a realistic appraisal of the job that has been done and from this benchmark, determine the direction for our future progress.

The emphasis of the effort under the existing Clean Water Act has focused almost exclusively on technology-based effluent standards and not on the actual improvement in water quality. No reliable data on national water quality exists, to the best of my knowledge.

According to a Department of Commerce report, $112 billion were spent on water quality from 1972 to 1979. This report said the taxpayer paid 42 percent of that bill including picking up the costs for community waste treatment plants across the Nation.

In practical terms, we all know that the other 58 percent of the bill was picked up by the taxpayer by paying a higher cost for products produced by the industry.

Before we launch the next phase of our assault in the form of BAT, we must understand the nature and dimensions of America's water pollution problems. When the Clean Water Act was passed,

there was a need for immediate and aggressive action. Since then, much has been achieved, as indicated by the improvement of the Ohio River in West Virginia.

Today, however, recognizing as we do that we have no real measure of water quality progress nor the magnitude of the job that remains, leads me to a specific area of concern to West Virginians: BAT, best available technology. To continue to require business and industry to comply with blanket technology standards, regardless of the existing water quality improvement, is as wasteful of our economic resources as ignoring water quality needs would be wasteful of our natural resources.

If a discharger can comply with water quality standards with current hardware, why should he be required to go out and buy new equipment just to satisfy the BAT requirement, a seemingly endless and expensive technology spiral. This money would be better spent expanding plants and providing more jobs for the people in our State.

I believe it is time we got a handle on our progress to date and carefully consider the impact of another round of standards based on equipment instead of the actual quality of our Nation's waterways.

In considering this legislation, the goals of the Clean Water Act should be reaffirmed. But now let's prioritize the actual cleanup and maintenance of our Nation's rivers and streams. Let's give enforcement agencies the tools to make determinations of what works, what doesn't work, and what we need to do from now on, and let's treat business and industry fairly—as a partner in this important national effort.

I thank you very much for your time.

Mr. ROE. We thank you very much for your splendid testimony. I think you have got a very strong point.

The gentleman from Minnesota.

Mr. STANGELAND. I have no questions for the gentleman except that he makes some very excellent points in the statement and I know they will be considered.

Mr. ROE. The gentleman from West Virginia.

Mr. RAHALL. Thank you, Mr. Chairman.

Thank you, Don, for your testimony this afternoon. I have met with you on many occasions back in the State with many other groups with whom you have been working to make these changes, and we have discussed the BAT requirements quite often.

In your testimony, you mention that Congress should begin to look at whether or not technology-based standards are still needed, and, as you know, these standards were implemented or these standards are implemented because, without them, we saw a situation where industry was often leaving some States that had tough standards to go to other States with lower standards.

I am wondering if you could give us some suggestions as to how Congress and/or the EPA can implement the BAT waiver provision so that it can be applied in a consistent manner across the country, so you don't have businesses fleeing from one State to another.

Mr. HYSELL. Congressman Rahall, if you don't mind, I would like to respond to that in letter form for you at a later date for the record.

Mr. RAHALL. With the subcommittee's permission, I am sure the record would be kept open.

Mr. ROE. No objection.

Mr. RAHALL. In that same letter, would you provide where such BAT waivers should be granted in West Virginia?

Mr. HYSELL. Yes, sir.

Mr. RAHALL. I appreciate that.

I want to thank you again for the information that you have provided me all along on this issue, and I believe the testimony you have given today will be very helpful to us in our deliberations.

Thank you.

Mr. ROE. Any further questions?

Mr. MOODY. No questions.

Mr. ROE. Thank you very much for being with us and taking your time.

Mr. HYSELL. Thank you, Mr. Chairman.

December 21, 1983

Congressman N. J. Rahall, II
440 Cannon Building
Washington, DC 20515

Dear Congressman Rahall:

Thank you for the opportunity to reply for the record to the two questions you raised during my November 10, 1983 testimony on behalf of the West Virginia Chamber of Commerce before the Public Works and Transportation Subcommittee on Water Resources.

Response to Question 1: I do not believe a credible case can be made for the often repeated claim that industry shops from state to state with respect to environmental standards. In no case has my company engaged in such practice. The Conservation Foundation poll already part of this record clearly shows that plant locations are consistently selected on the basis of more traditional factors such as access to markets, and raw material supplies, and labor costs.

The ability to obtain required environmental permits in a predictable time period in a given state is far more important than the question of the numerical limitations that might be imposed on water dischargers.

The waiver mechanism raised in my testimony is conceptually simple. When EPA promulgates an "Effluent Guideline" that an affected discharger believes was established based on conditions that are not applicable to the body of water receiving discharge, the discharger could apply for a waiver.

Any discharger who applies for a waiver would have to show that water quality standard for the receiving water would not be adversely affected with a lesser level of control. Where there is no water quality standard for the substance involved, the discharger would be required to show that the proposed discharge levels will not pose an unacceptable risk of harm in the receiving water based on the designated use for the water in that reach of the water body.

The permit writer would have the scientific fact base necessary for determination of the appropriate effluent limitation for the applicant's discharge.

Response to Question 2: My contacts in West Virginia suggest that a waiver may be possible at least in the following locations:

PLANT/LOCATION	SUBSTANCES
E. I. DuPont, Bell, WV	CN, Metals
Union Carbide, Institute	Various organic materials

Very truly yours,

BASF WYANDOTTE CORPORATION
Pigments Division

Donald R. Hysell
Manager of Human Resources

DRH:skm

Mr. ROE. Our next witness is Mr. Larry Krueger, Milwaukee, Wis.

The Chair defers to our distinguished colleague from Wisconsin, Congressman Moody.

Mr. MOODY. Thank you, Mr. Chairman.

Our city and our region has a very serious set of problems concerning water pollution. We have a CSO problem of substantial dimensions. We have the usual problems concerning treatment and storage and conveyance of sludge.

We are adjacent to a body of water which all of us agree should be kept clean, the Michigan Lake. And we have a number of industries in our region and city which do use water heavily in their processes. We have tanneries. We have chemical industries. We have food processing industries and we have steel and other metal industries.

We are in the process of intensive dialog in our community as to what indeed should be the best set of outcomes for us in terms of Federal legislation as well as State and local legislation, and what sort of funding we can reasonably ask for.

So our community is intimately and intensively involved in the questions that this subcommittee is considering. We have a lot at stake.

The representatives of industry in my community have been extremely responsible in attempting to come forward and to share in the process of finding solutions and they stand ready to bear their share of the burden. Almost without exception, they have come forward in a most reasonable way.

One of those examples is the gentleman before us, Mr. Krueger, and he is his own best witness. So I would like to let him proceed.

Mr. ROE. Mr. Krueger, go ahead.

TESTIMONY OF LARRY KRUEGER, CHIEF EXECUTIVE OFFICER, PELTON CASTEEL CORP.

Mr. KRUEGER. Thank you.

Good afternoon, Mr. Chairman, Congressman Moody, and members of the Water Resources Committee. As has been mentioned, my name is Larry Krueger. I am president of Pelton Casteel Corp., a steel foundry in Milwaukee.

I am pleased to share some thoughts on BAT, a concept that was originally explained to our industry as the zero discharge program—an issue I feel so strongly about that I have come to Washington to testify before an important committee of Congress. Needless to say, this is not an everyday occurrence for me. Thank you for permitting me this opportunity.

I have the happy task of informing you that just yesterday my firm bought out another Milwaukee foundry that was operating at just 25 percent capacity. We are putting these two foundries together and combining them into one plant at 50 percent of its capacity.

Our goal is to combine it with Pelton Casteel and to hopefully protect jobs for Milwaukee and provide for a brighter future for our company and our employees. My firm is committed to keeping Milwaukeeans employed and keeping our local foundries competitive in the foreseeable future.

I am here because I and my firm care deeply about clean water and support effective means to keep our water clean. Where I come from we have strong feelings about our environment. Industry has spent millions to clean it up. Our progress has been clearly evident.

Russell Train, former head of the EPA, has said the following about our efforts to clean up the Great Lakes: "It's one of the greatest success stories in American history."

U.S. News and World Report told its readers: "The open waters of Lake Michigan are of generally high quality and marked progress has been made in cleaning up major polluters along the shore line. The water is noticeably cleaner than it has been for years, due to industry clean up."

As an aside, our plant is adjacent to a stream which empties into Lake Michigan where Coho salmon were being snagged as recently as 1 week ago. This clearly is an indication of our water quality.

We, in industry, are proud of our record, and believe there is still more to be done in continuing this fine effort. My remarks are directed at how this cleanup can effectively move ahead.

As Congressman Moody knows, many of his constituents are greatly interested in BAT. My Congressman, I am pleased to tell you, has gone to some lengths to get the hometown view of BAT. Our Congressman Moody is the only Wisconsin Congressman to sit on the Public Works and Transportation Committee of the House, and he plays a very important role. Over 70 of us met early one morning with him on the single topic of BAT, and we found a responsive and open ear. I hope this subcommittee will also take our views into consideration.

I would like to share with the rest of the subcommittee some of the points that arose at the meeting with Congressman Moody, as reported to me by our chief engineer who met with our Congressman.

A representative of Babcock and Wilcox noted that, "We are at a 95 percent rate of purity on our discharge. If we are forced to go to

98 percent, the resultant sludge will be less desirable to the POTW than our current discharge."

Miller Brewing, I am proud to note, is headquartered in Milwaukee and was nationally cited last week for its achievement in discharge control, told Congressman Moody that, "In order to comply with Government regulations, we have built new treatment facilities at each of our plants over the last 7 to 8 years. To go to BAT now would cost 11 times—that is 11 times what we have already spent for a 1 percent improvement in discharge."

These Milwaukeeans are making general and important points that there must be some sense of cost trade-off in further regulations.

As you proceed with consideration of blanket national technology requirements, please keep in mind a point many of us from Milwaukee share: What is a cure for a problem in Tampa, Fla., may not be a cure for the problem in Northern States.

In fact, it is entirely possible that some equipment that works well in warm climates may not function effectively in our cold winters.

If a business is polluting, it should clean up its act. I have no personal question about this. We do not object to BAT per se, but do object to its blanket application, regardless of need. Just because some business in certain industry group may be a bad actor, it doesn't make all of us bad actors. Our foundry industry does not support the concept of protecting a fellow foundry that is polluting.

What we are asking for is fairness. We truly support clean water, and if BAT will help make our water cleaner, fine.

My problem is with this "all businesses are evil" approach. If a business can show, at its own expense, that it is not causing pollution through discharge and that the installation of costly BAT-mandated equipment will not improve the local water quality and that this local judgment meets with EPA or the State's approval, that business should not have to drain funds that could be used to hire more workers or keep current workers on the job to pay for equipment that won't make the water appreciably any cleaner.

I would like to comment that I am from a smokestack industry and I have heard comment on the demise of our industry. I have said that we are in this country to stay and the smokestack industry is not going to fold up its tent and disappear. So we are going to need help for the well-being of our country long term.

I don't believe that blanket BAT is in everyone's best interest, not the workers, not the environment, nor the employers.

I further strongly urge that this legislation address the true problems of water pollution, including runoff from nonpoint sources. It is this nonpoint source runoff that contributes a large amount of real pollution in our water. I feel it would be intellectually dishonest not to recognize this as a problem that must be addressed, instead of putting a huge multibillion strain on employers to get 2 percent of the problem when a much larger percentage comes from nonpoint sources.

Before I conclude, I would like to state that your agenda lists me as representing a particular special interest group, and that is not the case. I am here as an owner of a steel foundry and that is my

only reason for being at this particular hearing. It happens to be a mistake in your agenda.

Mr. ROE. We will see that it is corrected.

Mr. KRUEGER. I want to thank you for listening to the views of someone from Milwaukee, and if it is OK with the committee, Mr. Chairman, I request permission to insert written testimony into the record.

Thank you.

Mr. ROE. Mr. Moody?

Mr. MOODY. Thank you, Mr. Krueger. I think we all share the concerns you expressed.

Let me ask you, what other folks in Wisconsin, as far as you are aware of, agree with the statement that you have given us on the BAT issue?

Mr. KRUEGER. Well, the Wisconsin Association of Manufacturing and Commerce, the Milwaukee Chamber of Commerce, the Wauwatosa Chamber of Commerce, the Wisconsin Cheesemakers Association, Wisconsin Agribusiness Council, and I am very pleased to say the United Foundrymen of Wisconsin, and the Cast Metals Federation of the United States.

Mr. MOODY. Mr. Krueger, can you give us your comments on job loss in our region, should BAT be endorsed as you understand it?

Mr. KRUEGER. Well, all of the environment issues come down to the problem of competing in an international marketplace where some other countries are not under the same rules and regulations. I am not advocating that our environment should be polluted or the water should be polluted, but we have got to realize that we are facing international competition.

One of our major customers in Milwaukee just publicly announced that they are moving all of their construction equipment production to Kobe, Japan, because they can buy cheaper there than they can in the United States. That represents a 15-percent loss of that corporation's business to our industry and to our local employment picture.

Another one of the major machinery producers, that I did not get permission to use their name, so I can't, has their purchasing people exploring the Third World countries to buy product offshore, again replacing jobs and production from our own country. They are looking into countries that don't have the rules and regulations that we do. And therefore, we are faced with what I consider very unfair competition.

Mr. MOODY. One of the approaches that have been suggested if BAT is brought in as a mandate is waiver for BAT. Could you give me an idea of how possible or difficult it would be to live or work in an environment where you could go out and apply for waiver?

For example, with the testing needed to satisfy BAT waiver application, would that be extremely expensive or would that be modest?

Mr. KRUEGER. Congressman, I don't think I can honestly answer that question.

I do know that we are currently monitoring discharge by the previous rules and regulations that have been put into place. What would happen for waivers without looking into it with someone from our engineering people, I could not answer that question.

Mr. ROE. Thank you.

Any further questions?

Mr. STANGELAND. I just want to commend the gentleman on an excellent piece of testimony.

On page 5, I want to say you read correctly, but there should be a "not" in the first sentence of the last paragraph. That should be stricken to be correct.

Mr. KRUEGER. I did strike it in my copy. Thank you.

Mr. MOODY. Mr. Chairman, one thing you said was particularly important, and I remember it from the meeting you cite in Milwaukee, was that some manufacturers could actually meet BAT standards and spend a lot of money doing so without any appreciable increase or improvement in the quality of the effluent.

Can you talk about that just a little bit?

Mr. KRUEGER. Again, I can't comment as an expert in the technology, but we know for a fact on all of these pollution areas that you can go to a very high percentile of correction with somewhat reasonable costs. It is when you start making those extra steps that you start running into dollars that don't match up with the results that you are obtaining, and I think that would be true in water just as it has been proven to be true in the air pollution areas.

Mr. MOODY. I notice that Babcock and Wilcox asserted—and I will try to get this in more detail for the record—that we are in a 95 degree of purity in discharge and are forced to go to 98 percent with the resultant sludge would be desirable to the publicly owned treatment works than our current discharge. That is an interesting comment.

Do you have an additional insight on that?

Mr. KRUEGER. Well, sometimes you move the pollution problem from one area to another, that is what you are really doing. When you clean up the water, you may go into solid waste disposal problems.

Mr. ROE. If the gentleman would yield on that. I think that is one of the most telling points you have made in your testimony.

It would be well, I would think, and the committee would support that, that nobody wants to spend money for no purpose, but we are dealing in also a highly emotional area as you are aware. And it seems to me that the interrelationship of cleaning up an added percentile or two as to what the results would be in other parts of the waste stream ought to be considered in that direction.

I think that is pretty much what you are coming down on. In other words, if it is going to create a more complicated sludge disposal problem, then we ought to be dealing with that rather than just going off in one direction. That is really what you are saying?

Mr. KRUEGER. I would certainly agree with that. You just move the problem to a different arena.

Mr. ROE. No further questions.

The gentleman from Pennsylvania.

Mr. CLINGER. I take it, Mr. Krueger, that your feeling is, and I think I would agree, that industry generally has done a pretty good job in correcting what I think you all agree were abuses in the past and have brought the quality of water up to a much higher standard than it was previously. You are now saying, though, that the

incremental costs of getting to 100 percent from, say, 95 percent, put the cost-benefit way out of whack.

I think it is also important that you stress in your testimony that we really need to take a much harder look at the nonpoint source pollution.

If we were to reach 100 percent and the point source pollution was absolutely pristine and everybody was complying with it, what sort of a problem would we still have left as a result of nonpoint pollution?

Mr. KRUEGER. Well, I can only quote what I have heard. I have heard comments in the vein that at least 50 percent of the water pollution is coming from nonpoint sources. Therefore, if you got the point sources to perfection, as you say, you still would have the problem in front of you to be corrected.

I come from Milwaukee and the Congressman mentioned in his opening comments, we are faced with an antiquated sewer system and the county is struggling with the problem. I don't know where that answer is going to come from, but I also recognize from being in business in that community that we are going to pay for part of that solution.

We are prepared to do what has to be done properly, but it is that last inch that people are demanding of industry that is unfair from a cost standpoint that should be looked at very, very carefully.

Mr. ROE. Let me ask you this. Do you discharge into a municipal sewer system?

Mr. KRUEGER. Yes, we do.

Mr. ROE. And as I recall, the gentleman from Wisconsin and yourself testified that you are also faced with the problem of combined sewers. And we are coming back and saying that if we don't deal with that and force the people who are discharging directly into the lines and sewer plants that we are not going to clear up the problem.

Mr. KRUEGER. We have both sanitary and storm sewers, but when the storm hits, the storm sewers can't handle it and it ends up in the sanitary.

Mr. ROE. That is exactly what we have. So as was the case in the discussion with the people from San Francisco, that they were dealing with that issue as part of their overall plan. Rather than put all of the burden, if we have gone 85 percent of the way, on individual industries, and we are not going to achieve any further improvement unless we clean up those combined sewers first, then we have a valid point.

Mr. KRUEGER. I would certainly agree.

Mr. ROE. No further questions.

Thank you very much, Mr. Krueger. We appreciate your testimony.

Our next witness is Ms. Carolyn Carr, chairman of the Sierra Club Clean Water Act Campaign Steering Committee.

How is your cold today, Ms. Carr?

Ms. CARR. I am still coughing, but at least my voice has come back. You were gracious to let me come in today.

Mr. ROE. If you can summarize your statement, it will appear in full in the record.

[Statement referred to follows:]

STATEMENT OF CAROLYN ANN CARR, CHAIRMAN, SIERRA CLUB CLEAN WATER/TOXICS CAMPAIGN

SIERRA CLUB
530 Bush Street San Francisco California 94108 415/981-8634

Mr. Chairman and members of the subcommittee, I am Carolyn Ann Carr, Chairman of the Sierra Club's Clean Water/Toxics Campaign. I live in Auburn, Alabama, and am an economist by training.

I am here today, representing hundreds of thousands of members of the Sierra Club, to express our strong support for H.R. 3282, Rep. James Howard's bill to reauthorize the Clean Water Act. Other persons from the Club will present testimony today covering several specific areas of concern - 301(h) waivers, non-point pollution, and pretreatment, for example - so my remarks will be more in the form of an overview, except for a more detailed discussion of Section 404.

Reauthorizing and strengthening the Clean Water Act is one of the Sierra Club's major conservation priorities. While we are pleased to see the progress which has been made in cleaning up our nation's waters, we note with regret that the United States will not meet the two goals of the Clean Water Act, to eliminate the discharge of pollutants into navigable waters by 1985 and to attain fishable/swimmable waters by July 1, 1983. In order to reach these goals we believe it is necessary not only to reauthorize the Clean Water Act, but also to strengthen it. It is for this reason that we support H.R. 3282.

Rep. Howard's bill addresses an array of current water pollution problems -

Pretreatment of toxic wastes. Annually more than 200 million pounds of industrial toxic wastes are poured into the public sewer systems. Municipal treatment plants are not designed to remove them, and these wastes not only contaminate sewage sludge and effluent water, they also damage the treatment plants themselves. Some municipal treatment works have been rendered virtually useless, as in the well-known Kepone case in Virginia.

We are pleased to note that H.R. 3282 keeps the federal pretreatment program intact and does not allow municipal "opt-out." Quite frankly, most cities and towns lack the expertise to formulate toxics discharge standards for their sewer systems. Furthermore, "opt-out" violates the concept of uniform, nationwide pollution control standards. Industry would be thrown back into the old days of not knowing which standards might apply where. "Opt-out" has no place in the Clean Water Act.

Toxic hotspots. There are areas throughout the United States which will not meet water quality standards even after all the Clean Water Act's existing requirements are met. We support the provision in H.R. 3282 requiring the Environmental Protection Agency (EPA) to identify and develop controls for these "toxic hotspots."

BAT deadline extensions. We agree with EPA and industry that BAT deadlines need to be extended. When many of the regulations defining "best available technology" have not even been adopted yet, the existing 1984 deadline is unrealistic. H.R. 3282 would require BAT controls to be installed no later than three years after the

relevant regulations are adopted. EPA and industry testimony indicate that this is an adequate time frame and we concur with that assessment.

BAT variances or waivers. We agree with EPA and the Senate Committee on Environment and Public Works that BAT variances are not necessary. Furthermore, the idea runs counter to the concept of streamlining the permit process and would increase the workload of EPA, an already entirely overburdened and understaffed agency. We are pleased to see that such waivers are not included in H.R. 3282.

Water quality regulations. While we believe that the water quality regulations most recently proposed by EPA are relatively good, we remember the proposals put forward by Mrs. Burford. In order to prevent future attempts to undermine state water quality programs, we strongly endorse the provision of H.R. 3282 to incorporate existing water quality language into the law.

301 (h) waivers. H.R. 3282 would require that before sewage discharged into the ocean be granted waivers from secondary treatment, it receive primary treatment plus pretreatment for toxics equivalent to secondary treatment. The bill would also mandate that sewage discharged into estuaries meet the usual secondary treatment requirements of the Clean Water Act. We believe these are excellent proposals, since it appears that the original intent of 301(h) was to apply only to small municipalities that were unable to afford secondary treatment works, not to large urban areas.

Non-point sources. As we have achieved greater control over conventional pollution problems, we now find that half the water pollution in the United States comes from non-point sources. The recent internal review conducted by EPA concludes that in six of the ten EPA regions non-point pollution is the chief water quality problem. These non-point sources include soil erosion, urban runoff, sewer overflows, animal wastes, pesticides and herbicides from farmland, construction site runoff, acid mine drainage, and runoff from oil and gas exploration/production.

We support Rep. Oberstar's proposed amendment dealing with pollution from non-point sources, because it allows states the necessary flexibity to establish local control strategies. This is necessary due to the wide geographic diversity of non-point source problems. However, we do believe that deadlines and enforcement provisions need to be added to his proposal. Otherwise, states and municipal funding will continue to be diverted to other areas. We would hope that equivalent non-point language could be included in H.R. 3282.

Section 404/dredge and fill permit program. While Section 404 is rightly considered "the most important federal program protecting wetlands and wetland water quality," we should begin by reminding ourselves that it protects all the waters of the United States (not just wetlands) from degredation due to dredge and fill activities. These activities are a major problem throughout the country... causing hydrological changes in waterways, extensively altering aquatic ecosystems, polluting waters with toxic substances, increasing

turbidity and siltation, and often raising serious land use questions.

There is no doubt that Section 404 is one of the most controversial, if not the most controversial, provisions of the Clean Water Act. A great deal of this controversy arises from the fact that the immense societal and economic value of wetlands is not understood. Wetlands are often viewed as waste areas to be made productive by development. Yet wetlands serve as aquifer recharge zones; water-purification systems; fish, shellfish, and waterfowl habitat; and natural flood storage areas. Obviously, these are not unproductive wastelands.

We now have only half our original wetland acreage in the lower 48 states and we continue losing wetlands at a rate of approximately 450,000 acres per year. Clearly, if we are to protect wetlands from further destruction, we must have a workable 404 program.

While the 404 program has been described as Byzantine (among its more printable epithets), it has not been unworkable. The majority of permit requests move in a fairly expeditious manner and there are relatively few outright denials of permits. We are not opposed to some streamlining of the permit process, as in Mr. Howard's proposed 404(q), but we trust that the committee remembers that a certain amount of tedious peperwork can act as an effective filter to deleterious projects.

404 is not aimed at preventing real estate projects, energy development, or road construction; such requests can and do get permits. The law simply requires EPA and the U.S. Army Corps of

Engineers to analyze requests to dredge or fill in U.S. Waters and to permit that development which will not do irreparable damage to the overall aquatic environment.

We are extremely pleased, therefore, to see the strong 404 provisions in H.R. 3282. We view it as essentially maintenance language, making 404(b) operate the way it previously did before the changes put in place by the present administration.

We also support Mr. Mrazek's proposed 404 amendment, which we understand will be introduced shortly. It would build on H.R. 3282 by prohibiting discharge of toxic dredge and fill into the waters of the United States. It would also increase EPA's responsibilities in the 404(c) permit review process. And it would amend Section 505 so that it no longer refers just to the EPA Administrator and Section 402, but would insert "Administrator or Secretary" of the Army and "Sections 402 and 404." This would allow citizen suits against the Secretary for failure to performs duties under 404 and seems quite reasonable, since 404 is administered jointly by EPA and the Corps of Engineers.

Thank you very much for this opportunity to testify today. We hope you will report Rep. Howard's bill with the indicated strengthening amendments.

Mr. ROE. Please proceed.

TESTIMONY OF CAROLYN CARR, CHAIR, CLEAN WATER ACT CAMPAIGN STEERING COMMITTEE, SIERRA CLUB

Ms. CARR. Mr. Chairman and members of the committee, I am Carolyn Carr, chairman of the Sierra Club's Clean Water Toxics Committee. I live in Auburn, Ala., and I am an economist by training.

Mr. ROE. Pull your microphone a little closer.

Ms. CARR. I am here today representing hundreds of thousands of members of the Sierra Club to express our strong support for H.R. 3282, Representative James Howard's bill to reauthorize the Clean Water Act. Other persons from the club spoke yesterday covering several specific areas of concern: Section 301(h) waivers, nonpoint pollution, and pretreatment, for example, so my remarks will be more in the form of an overview, except for a more detailed discussion of section 404.

Reauthorizing and strengthening the Clean Water Act is one of the Sierra Club's major conservation priorities. While we are pleased to see the progress which has been made in cleaning up our Nation's waters, we note with regret that the United States will not meet the two goals of the Clean Water Act, to eliminate the discharge of pollutants into navigable waters by 1985 and to attain fishable/swimmable waters by July 1, 1983. In order to reach these goals, we believe it is necessary not only to reauthorize the Clean Water Act, but also to strengthen it. It is for this reason that we support H.R. 3282.

There are any number of problems that the bill treats. One of these, of course, is the pretreatment of toxic wastes.

Annually more than 200 million pounds of industrial toxic wastes are poured into the public sewer systems. Municipal treatment plants are not designed to remove them, and these wastes not only contaminate sewage sludge and effluent water, they also damage the treatment plants themselves. Some municipal treatment works have been rendered virtually useless, as in the well-known *Kepone* case in Virginia.

We are pleased to note that H.R. 3282 keeps the federal pretreatment program intact and does not allow municipal opt-out. Quite frankly, most cities and towns lack the expertise to formulate toxics discharge standards for their sewer systems. The town where I live, which is only about 25,000, is presently grappling with the problem of excess cyanide discharge from a manufacturing plant. Quite frankly, our local staff has no idea what they should be doing about it and are having to try to get the information elsewhere. Furthermore, opt-out violates the concept of uniform, nationwide pollution control standards. Industry would be thrown back into the old days of not knowing which standards might apply where. There would also be an adverse effect on manufacturers of pollution control equipment if standards varied from place to place.

On the question of toxic hotspots there are areas throughout the United States which will not meet water quality standards even after all the Clean Water Act's existing requirements are met. We support the provision in H.R. 3282 requiring the Environmental

Protection Agency [EPA] to identify and develop controls for these toxic hotspots.

Concerning the BAT deadline extensions, we agree with EPA and industry that BAT deadlines need to be extended. When many of the regulations defining "best available technology" have not even been adopted yet, the existing 1984 deadline is unrealistic. H.R. 3282 would require BAT controls to be installed no later than 3 years after the relevant regulations are adopted. EPA and industry testimony indicate that this is an adequate time frame and we concur with that assessment.

On the question of BAT variances or waivers, we agree with the Senate Committee on Environment and Public Works that BAT variances are not necessary. Furthermore, the idea runs counter to the concept of streamlining the permit process and would increase the workload of EPA, an already entirely overburdened and understaffed agency. We are pleased to see that such waivers are not included in H.R. 3282.

The typist had a problem there on that first line, but I started to insert the information that we are somewhat surprised that EPA is currently supporting the idea of BAT waivers. To quote a friend, "Even Ann Gorsuch never did that."

On the question of water quality regulations--while we believe that the water quality regulations most recently proposed by EPA are relatively good, we remember the proposals put forward by Mrs. Burford. In order to prevent future attempts to undermine State water quality programs, we strongly endorse the provision of H.R. 3282 to incorporate existing water quality language into the law. You certainly have discussed it at some length this morning.

H.R. 3282 would require that before sewage discharged into the ocean be granted waivers from secondary treatment, it receive primary treatment plus pretreatment for toxic equivalent to secondary treatment. The bill would also mandate that sewage discharged into estuaries meet the usual secondary treatment requirements of the Clean Water Act. We believe these are excellent proposals, since it appears that the original intent of 301(h) was to apply only to small municipalities that were unable to afford secondary treatment works, not to large urban areas.

On nonpoint source, as we have achieved greater control over conventional pollution problems, we now find that half the water pollution in the United States comes from nonpoint sources. The recent internal review conducted by EPA concludes that in 6 of the 10 EPA regions, nonpoint pollution is the chief water quality problem. These nonpoint sources include soil erosion, urban runoff, sewer overflows, animal wastes, pesticides and herbicides from farmland, construction site runoff, acid mine drainage, and runoff from oil and gas exploration/production.

We support Representative Oberstar's proposed amendment dealing with pollution from nonpoint sources because it allows States the necessary flexibility to establish local control strategies. This is necessary due to the wide geographic diversity of nonpoint source problems. However, we do believe that deadlines and enforcement provisions need to be added to his proposal. Otherwise, State and municipal funding will continue to be diverted to other areas. We

would hope that equivalent nonpoint language could be included in H.R. 3282.

I might say that I serve on Alabama's Statewide 208 Committee, which is probably the last 208 committee in existence. We find that nonpoint problems and the pollution of estuaries and marshes are our most pressing concerns, although some cities have very good runoff provisions. And we are getting statewide voluntary efforts on soil erosion and animal waste problems. But especially in the areas of urban runoff and sewer overflow we just don't seem to have a good handle on the situation.

Finally, on section 404/dredge and fill permit program while section 404 is rightly considered "the most important Federal program protecting wetlands and wetland water quality," we should begin by reminding ourselves that it protects all the waters of the United States—not just wetlands—from degradation due to dredge and fill activities. These activities are a major problem throughout the country, causing hydrological changes in waterways, extensively altering aquatic ecosystems, polluting waters with toxic substances, increasing turbidity and siltation, and often raising serious land use questions.

There is no doubt that section 404 is one of the most controversial, if not the most controversial, provisions of the Clean Water Act. A great deal of this controversy arises from the fact that the immense societal and economic value of wetlands is not understood. Wetlands are often viewed as waste areas to be made productive by development. Yet wetlands serve as aquifer recharge zones; water-purification systems; fish, shellfish, and waterfowl habitat; and natural flood storage areas. Obviously, these are not unproductive wastelands.

In Alabama these wetlands support a highly productive fisheries industry. We only have 122,000 acres of coastal wetlands, but the 1981 commercial fishing harvest was 34 million pounds of fish and shellfish worth $44 million. Some 90 percent of the commercial catch and 70 percent of the recreational catch are estuarine—or wetland—dependent species.

We now have only half our original wetland acreage in the lower 48 States and we continue losing wetlands at a rate of approximately 450,000 acres per year. Clearly, if we are to protect wetlands from further destruction, we must have a workable 404 program.

While the 404 program has been described as Byzantine, among its more printable epithets, it has not been unworkable. The majority of permit requests move in a fairly expeditious manner and there are relatively few outright denials of permits. We are not opposed to some streamlining of the permit process, as in Mr. Howard's proposed 404(q), but we trust that the committee remembers that a certain amount of tedious paperwork can act as an effective filter to deleterious projects. 404 is not aimed at preventing real estate projects, energy development, or road construction; such requests can and do get permits. The law simply requires EPA and the U.S. Army Corps of Engineers to analyze requests to dredge or fill in U.S. waters and to permit that development which will not do irreparable damage to the overall aquatic environment.

We are extremely pleased, therefore, to see the strong 404 provisions in H.R. 3282. We view it as essentially maintenance language, making 404(b) operate the way it previously did before the changes put in place by the present Administration.

We also support Mr. Mrazek's proposed 404 amendment, which we understand will be introduced shortly. It would build on H.R. 3282 by prohibiting discharge of toxic dredge and fill into the waters of the United States. It would also increase EPA's responsibilities in the 404(c) permit review process. And it would amend section 505 so that it no longer refers just to the EPA administrator and section 402, but would insert "Administrator or Secretary" of the Army and "Sections 402 and 404." This would allow citizen suits against the Secretary for failure to perform duties under 404 and seems quite reasonable, since 404 is administered jointly by EPA and the Corps of Engineers.

I did not include in my written comments any statements concerning the proposed 404 amendments of the State of Alaska or Senator Wallop's proposal to change 404 so that it would not, in his opinion, affect State water rights in the West.

We are very concerned about this second problem. Section 404 and the Endangered Species Act have never prevented one western water project from being completed or from using the water granted to it by any State.

Quite frankly, the problem arose in the Riverside case with which Senator Wallop was concerned, because they refused to allow the permit process to work. The sponsors could have adopted the suggested mitigation and proceeded under a nationwide permit. The cost in perpetuity of that alternative is less than one-half of 1 percent of the total project costs, less than the cost of each month's delay while the litigation is pending.

The project sponsors also could have applied for an individual permit and contested the need for any mitigation measures. But they chose neither option, and instead decided to sue the Corps of Engineers. So we would hope that any proposals even vaguely resembling Senator Wallop's would be rejected by this committee if they are offered.

Mr. Chairman, if you would permit me, I would like to after hearing some of the comments today. Quite frankly, we have found from reading studies from the Departments of Commerce and Labor, from the Council on Environmental Quality, from the McGraw-Hill business survey, that most of the supposed effect of environmental costs on unemployment is overrated and that in fact most problems are due to the age of outmoded facilities.

Thank you very much for this opportunity to testify today. We hope that you will report Representative Howard's bill with the indicated strengthening amendments.

Mr. ROE. We thank you very much for your testimony. We appreciate it.

The gentleman from Wisconsin.

Mr. MOODY. I am very interested in asking a number of questions, particularly since you are an economist. I want to ask you some cost/benefit type questions.

Mr. Chairman, do we have time?

Mr. ROE. We are on a second rollcall right now. I would suggest that if you have questions, we can submit them in writing.

Mr. MOODY. Let me briefly ask you. You have heard what has been said about the extra cost of reaching that last inch. You can get cost/benefit relationships which are just very disparate.

Now, we might want to push for that, except money is scarce. We are in a world of scarce resources and we want to go to that last inch, but maybe we can't go to this last yard over here. Since we are under budget restraints, we can pursue the equimarginal principle, which I am sure you are familiar with, and try getting the very best bang for the buck. And we can't do that if we push the last inch.

Could you comment on that?

Ms. CARR. I suppose we could probably get a greater cost/benefit effect in pollution control from, for instance, spending some money on nonpoint source problems right now than on the very expensive point source solutions.

Mr. MOODY. Does that tradeoff, point versus nonpoint?

Ms. CARR. Right. You have that kind of tradeoff.

I suppose what probably bothers people the most concerning, as you say, the last inch in point source controls, which is really where most of the money comes in, is the fact that so much of that involves toxic pollutants and the eventual effects of that on health. There you get into that very interesting question of what is health worth.

Mr. ROE. May I offer the suggestion, we are going to miss this vote. It is a critically important vote. Let's recess for 10 minutes.

[Recess.]

Mr. ROE. Why don't we just conclude with you, Ms. Carr, because the other members are on their way back. We had a double vote.

The point that was being developed, and I think you were listening to the testimony this morning as far as BAT is concerned on advance procedure. But I think that the testimony we had from San Francisco brought forth and merged together, in my mind, anyway, the two issues.

One was the point source, particularly the nonpoint source, and the vote on the issue of combined sewage. And the same way in Milwaukee.

Do you see us, when we start talking about priorities, that we would start leaning toward some energies in cleaning up the nonpoint source issue?

Ms. CARR. I do think we have to put more energies in nonpoint. I am a little bit concerned that we don't just sort of write off the point source problem.

Mr. ROE. I am not suggesting that.

Ms. CARR. I mean as something that is intractable, but I do believe that since we have gotten to the point of facing the fact that 50 percent of our pollution is nonpoint, that we are going to have to address more effort to that.

Mr. ROE. As the environmentalists have been testifying, there are a number who have testified to that particular issue. I think it is a very, very important point.

I am obviously not against cleaning up the water, but I am thinking about the point of view that some really strong intention

in the order of priorities and the order of funding that has been made available ought to be placed now upon that nonpoint source issue.

Ms. CARR. I agree.

Mr. ROE. I think that was the sum of the question.

Thank you very much for being with us. We appreciate it.

Our next group is the National Association of Metal Finishers, represented by Mr. Philip S. Ranno of the Ranno Electro Plating Corp. in Saddle Brook, N.J., and also on the panel is Dr. Richard Schossel, senior consultant of the chemical engineering department of Princeton University.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT BEFORE THE SUBCOMMITTEE ON WATER RESOURCES, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION CONCERNING THE CLEAN WATER ACT, PRESENTED BY RICHARD H. SCHLOSSEL, PH.D., NOVEMBER 10, 1983

My name is Richard Schlossel. My background is in chemistry, psychology, and ecology. I have been involved in industrial or university based research much of my professional life. For the past three years I have been a Visiting Fellow and Senior Consultant with the Department of Chemical Engineering, Princeton University. During that time I coordinated a hazardous waste management study that has culminated in a detailed preliminary design for a metals recovery facility to serve the metal finishing and other industries of the Northern New Jersey/Metropolitan New York area. A brief description of that study is attached. Copies of our detailed report are available upon request.

My mailing address is: Richard H. Schlossel, Ph. D., Center for Energy and Environmental Studies, Engineering Quadrangle, Princeton University, Princeton, New Jersey 08544. Telephone: (201) 494-9198; (609) 452-5445.

In the past several years I have learned much that can help resolve the hazardous waste management problem nationally. It is very straightforward. I present it to you at this time because you, the people you represent, and the nation as a whole wish to see this problem successfully resolved.

You have heard and will continue to hear people testify that any and all materials released in our environment must be treated, detoxified, or otherwise rendered harmless to human life and to the rest of the biosphere, on which human life depends. They will tell you that since our health and even our survival depend on this responsible management of materials that it is not a matter for negotiation.

Likewise, you have heard and will continue to hear that the costs associated with total detoxification and guaranteed harmless ultimate disposal of the large volume of byproducts of our industrial and domestic activity are an impossible burden. People will tell you that the costs of such programs of management will make it impossible for our country to survive economically and hence their objections to such programs are not a matter for negotiation.

Further, all these people will tell you that they hope that the federal government will successfully resolve this dilemma for them.

I am here to tell you how to accomplish this miracle with ideas that you can easily understand and probably already know, and with means already at your disposal.

First, the costs associated with maintaining public and environmental health by total detoxification for guaranteed

harmless ultimate disposal of the entire volume of byproducts of our industrial and domestic activity are an impossible economic burden. Effective hazardous waste management cannot be achieved this way.

Second, reprocessing these byproducts for recovery of usable materials and/or extraction of value is chemically simpler to achieve, costs between 1/5 and 1/10 as much as total detoxification, and is safer from a long term materials management point of view.

Third, I have a few observations about why we have not already succeeded in applying the recovery strategy, what the major pitfalls are, and what understanding is available for application right now.

- I have developed an approach for selecting the best available technology for any given reprocessing problem. It can be taught to an interested person in 1/2 hour.
- I have discovered that the basic mind-set necessary to successfully manage a recovery enterprise is different than that required to manage a manufacturing enterprise. That is why some entrepreneurs and companies that have entered the recovery business have failed badly. Based on my observations I have also developed some simple do's and don't's for a recovery enterprise which can be made available.
- While our legislators were initially aware of the importance of reprocessing in the resolution of the hazardous waste problem, current legislation, current regulations, and current administrative procedures do not reflect this awareness. This defect in legislation, regulations, and administrative procedures can be remedied by implementing three observations:
  - The byproduct of a process, industrial or domestic, is not necessarily a waste. It is a waste if no agent of our society is engaged in extracting materials or other value from such a byproduct and its destination is ultimate disposal. As long as someone is legitimately engaged in extracting value from a byproduct it is inappropriate to label it waste. If someone wishes to reprocess a material labeled waste it should immediately be relabeled a byproduct. "Waste" is a designation of social intent to withdraw from responsibility for the management of a material. Where such responsibility remains and is capable of being properly exercised the material in question is not a waste.

- If such a definition of waste opens a loophole to improper management or discharge it can be closed by recognizing that intent, capability, and active engagement in reprocessing byproduct materials for extraction of value can be easily distinguished from intent, capability, and active engagement in ultimate discharge and the two alternatives can be regulated separately.

- Our legislation, regulations, and administrative procedures need to be amended to eliminate impediments and inhibitions to the recovery approach and to add items which will encourage and facilitate its use. If we only forbid improper discharge methods we imply that proper discharge methods alone can resolve the problem. This is not true. Recovery techniques, process substitution, and proper discharge methods, taken together, can resolve the problem by innovative application of appropriate, available technology. Our legislation, regulations, and administrative procedures must reflect our positive intent in this matter.

- Finally, in holding hearings in which differing views are presented you are in effect adjudicating between them. Any resulting legislation reflects your joint judgment. Since essentially all the parties who will appear before you on this issue would like to see it successfully resolved, and since they jointly represent a significant resource of intelligence, inventiveness, and experience, I suggest that you supplement this hearing format with cooperative problem solving activities between these concerned witnesses. Trained facilitators for such problem solving are available. The aim of such cooperative activity is to invent a solution which meets the needs of all the participants while avoiding their objections. It differs from a negotiation format, which seeks to maximize individual advantage and minimize individual objections to positions arrived at separately, in that it brings the resources of an interacting group to bear on the problem. More information on this type of approach is available.

Hazardous Waste Management - The Northern New Jersey/Metropolitan New York Metals Recovery Facility

Coordinated by Richard H. Schlossel, Ph. D.

Dr. Richard H. Schlossel, a chemist, psychologist, and ecologist, first became involved with the nation's hazardous waste discharge problem in 1980. With the help of like minded colleagues at Princeton University and the support of local New Jersey Foundations he was soon hard at work clearing away the mass of confusion, fear, and accusation that seem to be the main features of our thinking about hazardous waste.

His initial insights set the tone for the optimism of his current vigorous effort to organize positive movement out of the dilemma:

- "Waste" is not a characteristic of any material, no matter how vile, toxic, or ugly. "Waste" is a human attitude toward a material and "wasting" is a human activity.
- Proper management of these discharged materials begins when we realize that they are commodities that have value when properly processed and marketed. By labeling these commodities "waste" we take on the expensive and difficult burden of proper disposal.
- All chemical and biological processes produce materials which would interfere with continuation of the process or organism if they were not removed. The community of living organisms, the biosphere, has solved this problem by passing on materials that are the interfering output of one organism to another organism for which they are the life-supporting input. Our misguided urge to bury active chemicals in the ground is based on our biological heritage. Animals characteristically bury their discharge.
- The key to resolving the hazardous waste crisis before we are all poisoned by the by-products of our productive activity is to alter the attitudes toward these materials that prevent us from managing them intelligently. We then need to organize the economic infrastructure so that all our outputs are the inputs to some beneficial later process. Hazardous waste discharge is a social, not a technical problem. Our technology is adequate if we direct it properly.

Dr. Schlossel translated these insights into a resolution of one of our more difficult hazardous waste discharge problems, the toxic heavy metal discharges of the electroplating industry. Conferring with electroplaters, State environmental regulators, sewerage district officials, local governments, and citizen advocate groups, Dr. Schlossel invented and recommended a strategy wherein metal commodities would be removed from electroplating discharge streams by ion-exchange, a well developed technology similar to that used in domestic water softeners. These metals, now securely trapped in portable ion-exchange cannisters, would be taken to a central facility where the metals would be released and reprocessed for sale. The refreshed ion-exchange cannisters could then be returned to the electroplating shops for another cycle. A key feature

of this strategy is the centralization of the more expensive and sophisicated steps in the process so that electroplating shops, traditionally small businesses, would find it economically feasible to participate.

While Dr. Schlossel's team at Princeton University works on details of process design, he, together with the electroplaters, State regulators, and other officials are now conferring with regional government agencies about funding and with interested developers about implementation.

Dr. Schlossel is now working on similar strategies for toxic organic chemicals, the goal being recovery of usable products or safe detoxification. Dr. Schlossel claims that achieving our aim of resolving the hazardous waste discharge problem is not difficult when all the participants to a particular problem situation confer. As soon as everyones particular needs, positive suggestions, and objections are out in the open, the depth of experience and ingenuity that are available in such gatherings will usually lead to a solution in days rather than decades.

Dr. Schlossel is particularly concerned that we begin to manage our current discharges properly as soon as possible. He says that only then can we face the job of cleaning up our past mistakes with confidence and commitment rather than being concerned with accusations and liability.

Acknowledgment:

Dr. Schlossel would like to thank The Fund for New Jersey and the Victoria Foundation for supporting his initial studies. He would like to thank these two foundations and The Florence and John Schumann Foundation and The Jockey Hollow Foundation for their support of the design and dissemination of the Metals Recovery Facility. In addition, he would like to thank the Center for Energy and Environmental Studies and the Department of Chemical Engineering, Princeton University for their cooperation in making their facilities available for these studies.

A CENTRAL METAL RECOVERY FACILITY

A Preliminary Appraisal of Feasibility for the Treatment of Electroplating Job Shop Wastes

CHAPTER 1: INTRODUCTION

Over the past decade and a half, there has been a growing awareness in government, industry, and the general public alike that more sophisticated methods must be used in the management of the discharges of our industrial society or our health and well being will suffer significantly. This awareness has resulted in legislation and concomitant regulations which often address the problem in terms of prohibitions with the result that the atmosphere in which efforts toward adequate detoxification or reprocessing for reuse of materials have been attempted has been clouded by confusion, fear, and accusation. The work described in this report, comprising a preliminary design, feasibility study, and economic evaluation, was undertaken to provide a positive alternative for the metal finishing industry in meeting its obligations under current environmental regulations and to demonstrate that the negative cloud which hampers progress toward effective discharge management can be dispelled.

An initial examination of the discharge management question made it clear that it is primarily a social and economic task, not a moral or technical issue. The guiding principles for the initial design are as follows:

- "Waste" is not a charcteristic of any material, no matter how vile, toxic, or ugly. "Waste" is a human attitude toward a material and "wasting" is a human activity. By labeling a material "waste" we take on the expensive and difficult burden of proper disposal.
- All chemical and biological processes produce materials which would interfere with the continuation of the process if they were not removed. The community of living organisms, the biosphere, has solved this problem by passing on materials that are the interfering output of one organism to

another organism for which they are the life-supporting input.

The key to resolving the hazardous waste discharge problem before crucial life-supporting aspects of our environment are irreversibly damaged is to alter the attitudes toward these materials that prevent us from managing them intelligently. We need to organize the economic infrastructure of our society so that all our outputs are the inputs to some benign or beneficial natural or industrial process. Our technology is adequate if we direct it properly.

The major social aspect of this particular problem is that the metal finishing industry is, to a large degree, made up of a number of independent job shops clustered in metropolitan areas. These job shops are usually moderate in size and lack sophisticated in-house technical staff. They are also mostly sole proprietorships which, if faced with economically impractical alternatives, would shut down, thus depriving their home communities of employment opportunities and tax revenues.

The regulatory aspects concerning this problem have been promulgated by the United States Environmental Protection Agency in the Metal Finishing effluent limitations (1). This regulation sets concentration limits on the discharge of pollutants from the electroplating and metal finishing facilities into U.S. waters or into publicly owned treatment works. The reference cited above gives a summary of the regulation, the background of the regulation, the legal authority, and the compliance schedule. The compliance date for existing non-integrated electroplating plants is April 27, 1984.

The major technical aspects of the problem derive from the need to process relatively large volumes of rinsewater which contain only small amounts of

dissolved metal salts and to significantly reduce the concentration of these already dilute solutions to meet discharge regulations. Further, it is necessary to process the rinsewaters from each metal finishing line separately so as to maintain the segregation of the metals involved. The separation of mixed metals, except in special cases, is very difficult and expensive. Neither the value of the recoverable metals nor the profitability of the metal finishing process justifies the large investment in the equipment and operating costs for separating mixed metals.

SUMMARY

In reponse to a need for more intelligent management of industrial discharge and the specific need of the metal finishing industry to meet federal regulations, several interested individuals cooperated in developing a strategy which accommodates the social and technical conditions this industry faces. Ion-exchange, a well established technology, is recommended as the basis of an approach which involves (a) in-plant capture of metal ions from the various wastewater streams of the electroplating process, (b) transport of exhausted ion-exchange cannisters to a central recovery facility, (c) regeneration of cannisters for return to the metal finishing plants, and (d) processing of the resulting concentrated metal salt solutions for sale. The favorable economics of this process results in large measure from the centralization of the regeneration and processing steps which require sophisticated personnel and equipment.

A review and comparison of alternatives is reported. The ion-exchange/central regeneration strategy has significant advantages over the E.P.A. suggested hydroxide precipitation method. In comparison with the precipitation method, it produces no toxic sludge which would require ultimate disposal in landfills, and it is significantly lower in capital requirement and operation costs. It can also be used to complement other in-plant metal recovery systems when the amount of metal that would otherwise be discharged justifies the investment in such equipment.

A conceptual level design for the operation was developed using estimates of metal discharge rates calculated from information provided by a significant fraction of Northern New Jersey/Metropolitan New York electroplaters. Assuming that 100 of the area's 300-400 electroplaters would wish to participate, a

central facility involving a total capital investment of $6.8 million would be required. If the number of electroplaters interested in this strategy were to increase significantly, or if, as is expected, other industries with similar discharges should wish to participate, the central facility capacity could be expanded by a factor of four with little additional requirement for further capital except for cannisters.

The combined operating cost of the central facility, credit for metal sold and consulting services by the staff, depreciation, return of the initial capital, and profit to the developer result in a yearly fee to a representative electroplater of $12,500. This fee is related directly to the amount of metal to be recaptured by the central facility, and therefore it reflects the size of the individual plater's operation and its efficiency. Increases in efficiency directly result in reductions in fees.

In order to interface with the central facility, the representative electroplater would be required to modify his current operation and install new equipment at a cost estimated at $10,000. A comparable investment for the E.P.A. suggested precipitation system would be $183,000. The latter would also require considerable additional floor space whereas the former would not.

The central facility is intended to carry out metal recovery. If a metal finisher produces mixed metal discharges for which economically feasible separation processes are not yet available, these mixed metals will not be captured by this facility. This design is not intended for waste pretreatment preparatory to disposal.

Some bench-level engineering measurements remain to be carried out in order to verify supplier and scientific journal data, and to choose among competing process alternatives. The authors estimate that the error bounds on the calculations presented in this report are ±25%.

Mr. ROE. Please proceed.

TESTIMONY OF PHILIP S. RANNO, RANNO ELECTRO PLATING CORP., SADDLE BROOK, N.J., NATIONAL ASSOCIATION OF METAL FINISHERS; AND RICHARD SCHLOSSEL, SENIOR CONSULTANT, CHEMICAL ENGINEERING DEPARTMENT, PRINCETON UNIVERSITY

Mr. ROE. I want to welcome you to the committee. I know you have been very helpful to us in the past in your testimonies, Mr. Ranno. The Members—both of them are from New Jersey. That doesn't mean you are going to get all your points.

Mr. RANNO. Thank you, Mr. Chairman.

Mr. ROE. Be that as it may, I welcome you back. I know you both have been working very hard in this particular area and have direct expertise and have been, what do you say, operating with the legislative process up to this point. Now we would like to hear from you not only as an industrialist from the State of New Jersey, but also representing the National Association of Metal Finishers. So you go ahead. Both of your testimonies will appear, of course, in full, but I see they are not long, so go ahead.

Mr. RANNO. Thank you, Mr. Chairman. I will be brief.

Mr. Chairman and members of the committee, I am Philip S. Ranno, president of Ranno Electro Plating Corp., Saddle Brook, N.J. I am here today representing the National Association of Metal Finishers [NAMF], which I serve as a member of the board of directors and past president. I am also a member of the Passaic Valley Sewage Commission's Public Advisory Committee on Pretreatment in New Jersey and thus have a longstanding involvement and personal interest in the pretreatment program.

Pretreatment has been an issue of major concern to members of our industry since electroplating is one of the first industrial categories to be regulated by EPA categorical pretreatment standards. NAMF's members, which represent a segment of the overall metal finishing industry, currently face an April 1984 compliance deadline. Therefore, today's hearings are extremely important. We hope we will underscore the need for the Congress to act quickly and modify the existing pretreatment program.

For several years, NAMF has been advocating a flexible approach to the pretreatment program. We support efforts by the States, cities, and municipal treatment authorities to permit an alternative approach to categorical pretreatment standards. Today I would like to focus on a specific proposal involving the use of innovative technology in our industry. We are here to urge that Congress clarify the act's application to innovative pretreatment technology.

Also appearing today is Dr. Richard Schlossel from the Princeton Center for Energy and Environmental Studies. Dr. Schlossel will provide what is, in my view, an excellent demonstration of why recognition of innovative technology in the pretreatment program is needed. NAMF requested Dr. Schlossel to appear today because of his expertise in the development of technology to manage the discharge of metals.

Let me very briefly summarize the major points in order to provide you and the rest of the committee with a better understanding of why we feel so strongly that the use of innovative technology in the pretreatment program is best for our industry and the environment.

NAMF represents an industry of small businesses with an average electroplating job shop employing 15 to 20 people and capitalized at approximately $250,000. As small businesses, we are therefore severely impacted by any costly regulatory requirements.

Existing EPA regulations for electroplating pretreatment standards will impose approximately $1.3 billion in capital costs and nearly $500 million in annual operating costs. According to the agency's own estimates, these standards will result in the closure of approximately 20 percent of the job shop firms in this country and the loss of nearly 10,000 jobs. That is a staggering impact on this industry.

EPA pretreatment standards for electroplating and metal finishing are based on the use of conventional treatment technology. This technology consists of cyanide oxidation, chrome reduction, metal precipitation, and solids removal. As I have noted, this technology is expensive, both in terms of capital and operating costs. In addition, it results in another environmental problem, since the technology produces large quantities of sludge which must be disposed. For some time it has been apparent that there must be a better way to protect the environment at a lower cost and with less generation of solid waste.

The recent work of Dr. Richard Schlossel provides an excellent illustration for the need of additional flexibility in the pretreatment program. Dr. Schlossel's innovative approach involves the use of portable cartridges containing ion exchange resins, and the recovery of the metals from these cartridges at a central facility. We believe that this is the kind of less costly, resource-conserving approach that the Congress should encourage.

Dr. Schlossel has for some time been concerned with the management of hazardous waste. He believes, as we do, that a sound theory of environmental management involves the recycling and reuse of toxic substances to the extent practicable. In collaboration with the New Jersey Department of Environmental Protection, the Passaic Valley Sewerage Commission, and the electroplating industry in New Jersey, Dr. Schlossel has been exploring innovative approaches for dealing with the toxic metal wastewater discharged by job shop platers. His objective was to develop a new approach that would control the release of pollutants in a manner that is both economically feasible and environmentally sound.

Dr. Schlossel's innovative approach involves the treatment of job shop electroplating wastes at a centralized recycling and recovery plant. At the individual plating shop, the system would involve segregation of waste streams and flow reduction and the use of ion exchange resins in portable cartridges. The cartridges would be transported to a central treatment facility, which would remove the toxic materials from the cartridges so that they could be reused. Dr. Schlossel has recently confirmed that this approach is both technically and economically feasible.

The central recovery plant scheme developed by Dr. Schlossel has a number of advantages over standard treatment technology currently available. By eliminating the requirements that plating shops install individual treatment systems, the treatment costs to platers would be dramatically reduced. In addition, the use of a central recovery plant would result in far greater effluent reduction than the use of conventional treatment systems by individual plating firms. Finally, because metals previously lost to the environment are recovered for reuse, the problem of treatment sludge disposal would be greatly minimized.

Although this new treatment scheme is a better solution, the industry cannot take advantage of it at present. Additional time is needed to attract the firms and individuals necessary to build the central treatment facilities. As with any new treatment installation, the startup time will be significant. Under the present law, electroplating job shops must comply with pretreatment standards by April 1984. Thus, unless more time is available, firms in New Jersey and other NAMF members will not be able to take advantage of this promising new development.

The Congress should clarify the availability of a mechanism for firms which plan to use innovative technology to meet pretreatment standards. As discussed above, electroplating firms currently face an April 1984 deadline for compliance with categorical standards. In order to take advantage of the new central recovery plant technology which Dr. Schlossel has developed, we need more time than allowed by the current regulations.

The Clean Water Act recognizes the value of innovative technology in provisions applicable to direct dischargers. Section 301(k) of the act provides that a facility subject to an NPDES permit may receive a 3-year extension of time to comply with best available technology effluent limitations if it proposes to use innovative technology. If a plant proposes to comply using an innovative control technique which has a substantial likelihood of achieving significantly greater effluent reduction than required, or by using a system that has the potential for significantly lower costs, and the system has potential for industrywide application, the date for compliance may be extended from July 1, 1984—the current deadline—to July 1, 1987.

NAMF believes that the concepts in section 301(k) of the act are sound and should be applied to the pretreatment program. Like the effluent limitations for direct dischargers, pretreatment standards are based on the use of technology. It is in the public interest to allow flexibility in compliance deadlines to allow the development and use of improved and innovative control techniques. Accordingly, NAMF urges that Congress make it clear that the mechanism in section 301(k) of the act is applicable to pretreatment standards under section 307(b) of the act.

In conclusion, Mr. Chairman, our commitment to a clean environment is as strong as our commitment to the overall success of the industry. We know that we cannot have one without the other.

I appreciate this opportunity to present our concerns with the pretreatment program and will be happy to answer any questions or provide any additional information the committee may desire.

Mr. ROE. We will hear from Dr. Schlossel and then we will ask questions of both of you.

Dr. SCHLOSSEL. Thank you, Mr. Chairman, members of the committee. My name is Richard Schlossel. I have a background in chemistry, psychology, and ecology. For the past 3 years, I have been involved with hazardous waste management studies at Princeton University and for the past 2 years in applying the results of these studies to a design for an overall strategy to deal with the toxic heavy metals output of the plating and other metal-using industries in northern New Jersey and Metropolitan New York.

Now, the issue here is really that in order to achieve a clean environment, in order to have the kind of public health guarantees that we need in order to have clean water, what we are doing basically is we are managing materials and I would like to look on the management of materials in a positive light.

We have two sides to the question. One is the maintenance of public health. We don't want to put toxics into the environment in a way that would be damaging to the public and a way that would be damaging to the biosphere which supports humanity. On the other hand, we have an equally pressing issue that we don't want to damage our economic base by imposing on our industries costs that they cannot bear. What I think we have lost sight of in this is the fact that when we argue about, should we or should we not detoxify a material before we discharge it, that there is another alternative and that other alternative is recycling the material, it is reprocessing and extracting a value.

The reason I bring this up is, first, that we have found in our studies that the technology is available to reprocess and recycle most of the discharged materials that we are worried about. The available technology needs to be sorted through, and proper selections made. But what we do find is that the cost of reprocessing materials is between a fifth and a tenth of the costs of properly detoxifying those materials before ultimate discharge. And so we have a real economic incentive to look seriously at reprocessing of materials.

Now, in this case, this is what we have done. Since metals are useful, valuable materials, I thought it was a waste to clean up our waters and not have these materials for reuse. What I did was I sorted through the several technologies that are available for this and I selected the one that was best suited to the economic and the technical realities of the electroplating industry and what we have here are a number of small shops. We have limited any technical capability in-house. We have relatively dilute solutions of metals going down the drain and these things together were synthesized into the program that we have put forth at Princeton in our detailed preliminary report.

The key here is that we have put in each plant the capability of removing these metal commodities from the waste stream before the waste stream goes down the drain. That is the simplest step. We have put the complicated steps which are the regeneration of the ion exchange cannisters, the reprocessing of the metal for resale in a central facility and we save money two ways in doing that. First, we reduce the amount of expertise that we need redundantly in each of these plans; and second, we reduce the amount of

expensive equipment that we would need redundantly in each of these plans.

I was very pleased with the economic analysis which my group at Princeton has done indicating a significant economic advantage here of a recycling method. Since recycling and not putting these materials into the environment is really an advantage, it is also unusual that it was also an economic advantage to do this and so we win whichever way we look at it.

One of the reasons we were able to put this design together was that we consulted not only with the plating industry about their specific process and their specific needs, we also consulted with the State regulators about their needs; the sewage districts about their needs. We spoke to the environmental groups locally and we found that we could synthesize all of their needs into one particular design.

In closing, I want to point out just one thing. Reuse or recycling of materials requires that the economic and legislative environment within which this is done be facilitating, be favorable and even though our environmental programs have had reuse and recycling as a concept in them, the legislation, the regulations, and the administrative procedures have really not reflected the necessity of doing reprocessing.

What I would urge you, Mr. Chairman and members of the committee, to consider seriously, not only in the legislation before you right now but also in other environmental legislation which is currently being examined, is to make sure that this legislation and the regulations that come out of it facilitate, actively if possible, application of technology to reprocessing because in that lies the lowest cost and greatest safety in terms of dealing with point source discharges.

Thank you, gentlemen.

Mr. ROE. Well, we want to thank you, doctor, very much and your statement will appear in full in the record.

Have you done any testing? Is this theoretical or have you done any pilot work at this point?

Dr. SCHLOSSEL. At this stage, we have done some design work, employed not only students and faculty at Princeton, but also two consultants with a combined 90 years of experience in the ion exchange trade. We are currently putting together the benchwork which is the final testing of some of these procedures. We are testing not so much the technology which is very straightforward and has been around for a very long time. If any of you have water softeners, you have ion exchange technology in your homes.

Mr. ROE. What is your process to regenerate the capsules?

Dr. SCHLOSSEL. We regenerate the capsules in a standard way. The cad ion resins by strong acid and the iron resin by a combination of strong base and salts. So the regeneration procedures are standard.

There are a number of alternatives for some of the metal capture strategies and what we will be doing in the next few months is sorting out which of these is optimum for the particular applications. We will also be verifying that the numbers that were given us about metal-carrying capacity of the various resins from the sev-

eral manufacturers we have been in contact with are, in fact, correct. So we will be doing some cleanup-engineering studies.

The technology that we are dealing with is established technology. Ion exchange has been around for 75 years. It has been marketed for this purpose for approximately 15. What we are doing here is a significant innovation in the design of the enterprise.

Interestingly enough, what we need to apply this technology is better understanding of basic business principles. We need to put the expertise in technology in the right places. We need to be able to optimize the situation economically from the point of view centralizing expensive capital equipment when possible, just basic business sense. It is not really that complicated or that difficult. We need the kind of innovative entrepreneurial sense that has gotten the American industrial establishment where it is and we need that kind of entrepreneurial sense coupled to the use of technology for reprocessing.

One of the things that I discovered in investigating this, and this is something that was a real surprise, and that is that the kind of thinking, the kind of mind set that goes into reprocessing and recovery, is different than the mind set that goes into manufacturing. We haven't previously recognized this. A lot of entrepreneurs have attempted reprocessing and not been successful because the basic issues are different.

There are certain do's and don'ts that apply to reprocessing that are unique to it. Several companies that have attempted it have gotten into trouble not only financially but also legally because they have wound up taking materials into their facilities that they have no capacity to deal with.

This is getting into detail and I don't want to take the committee's time, unless the committee is interested in specific do's and don'ts. Reprocessing is a tricky way of applying available technology and it works. It really, honestly works.

Mr. ROE. Both you and Mr. Ranno pointed out that if you have a grouping of plating operations in a particular region instead of having individual treatment plants with all of the indigenous problems that go with it in each respective plant, you are saying, "Let's collect the material and take the material to the plant to be processed," which I think has merit.

I think it is an approach. It is an approach. What would you do if you had an area, however, where you had only one plating operation in, say, 60 square miles or something of that nature?

Mr. SCHLOSSEL. That very rarely occurs. Electroplating specifically and metal finishing generally are service industries to manufacturing and they tend to occur in concentrations of manufacturing. If we had an electroplating shop out in the middle of Iowa, what would it be doing? Really, where we have a concentration of electroplating shops, for instance, in the Passaic Valley in the whole northern New Jersey area and they serve the industrial complex of northern New Jersey and New York. We have another concentration in Philadelphia and Camden. There is another one in Pittsburgh. There is another one in Providence. They tend to center and cluster like that throughout the Nation.

Where you do have somewhat isolated metal finishing and metal handling facilities it is feasible to consider trucking these cylinders

over longer distances simply because of the advantages of central reprocessing. What we are talking about here are cannisters that weigh approximately 180 pounds by our current design. These cannisters can capture and hold in strong chemical combination between 4 and 7 pounds of metal, depending on the metal.

Transportation isn't the problem. The transportation of the cannisters is completely safe. I could break open one of these cannisters totally saturated with a toxic metal and walk barefoot through the resin. There is no danger. It is only the strong acid and strong base that will release the metal. That makes this kind of facility a compatible neighbor. It is not handling dangerous or toxic material out in a way that could be disbursed and we considered that very carefully when we were in the process of recommending siting for this and also in the choice of the technology because we are dealing with a populated area.

Mr. ROE. The gentleman from California.

Mr. PACKARD. Thank you, Mr. Chairman.

I was intrigued by your background. I suspect that you might have had to have a background in psychology in order to survive in the other two backgrounds.

Mr. ROE. That will help around here, too.

Mr. PACKARD. I think all of us ought to have a little bit of that.

I sense from your testimony, both the written and oral testimony, Mr. Schossel, that the technique that you drafted or that you developed would meet the clean water standards now existing.

Dr. SCHLOSSEL. It would not only meet them, it could meet more stringent standards as well. Ion exchange as a method produces the cleanest water in laboratory environments that we use so that appropriate application of this technology could meet any water standards we would choose to impose.

Mr. PACKARD. And on a volume basis, you perceive that it would do it in a cost-effective method.

Dr. SCHLOSSEL. We would be able to meet the current standards in a cost-effective method; yes, sir.

Mr. PACKARD. Sometimes in laboratories, we find where procedures are effective but when it becomes adapted to the commercial aspects, it becomes sometimes not cost effective. How far are you into the program? Is it a pilot program? To what extent have you now proceeded on your experimentation?

Dr. SCHLOSSEL. We have completed our detailed preliminary design. If the committee is interested, I will be glad to make our report available to you.

The technology is in use in many industrial applications. It is the technology that removes radioactive materials from the water on our nuclear submarines. It is used in mining. It is used in a variety of metal processing and metal recovery applications and so it is not strictly a laboratory tie.

In terms of our specifics, this detailed preliminary design gives us the basic plus or minus 25-percent confidence limits economic design and on the basis of this, we are proceeding to negotiate with developers, negotiate with financial sources, et cetera.

The remaining technical work in the laboratory is purely testing and refinement at this stage. It is selection between alternatives. It is the checking and making sure that the numbers we have gotten

from our industrial sources of materials are correct and I would say that this would be complete in 4 to 6 months.

Mr. PACKARD. And you are saying for a 3-year extension compatible with the sections of the regulations now? In those 3 years, do you think that your system could be implementable on a level that would satisfy some of these industrial complexes where there is electroplating going on?

Dr. SCHLOSSEL. I can give you some approximate numbers about our implementation schedule right now, if you wish. I foresee approximately 6 months in cleaning up engineering details making specific measurements in our laboratories. Simultaneously with this, the plating industry of northern New Jersey and Metropolitan New York is analyzing our preliminary report in detail with an eye to making recommendations to their membership and to form the basis for a relationship with a developer in order to build this facility.

I would see that process taking also approximately 6 months.

At that point, with a relationship with a developer in hand and the final details in hand, it would take a professional engineering firm on the order of 6 to 10 weeks to produce the final design and I would say 9 months to 1 year to execute the design in the form of a facility which would then be capable of being up and running.

Not all the communities would be interested in employing this procedure as far along as we are. Princeton University will make this preliminary design report available to any and all parts of the plating industry nationally that wish to see it. This is not a confidential document. Nor was it prepared exclusively for northern New Jersey. This research was publically funded and will be generally available.

Mr. PACKARD. The state of the art is constantly changing and improving naturally with technology and it is conceivable that after you have developed this system that there can be additional improvements in the state of the art and there would tend to be a constant wishing to or requesting for delays on the basis that there is something better now being studied or you have a pilot project on a better system than what you are proposing.

It would be easy, I suspect, for the industry to constantly be looking for a way to just postpone implementation of the regulation. What is your response, Mr. Ranno, in regard to this being merely a delay technique on the basis that there is always innovative pretreatment technology that is going to be better and therefore let's wait before we implement the regulations now?

Mr. RANNO. If I could attempt to answer that, Mr. Packard, we, and I am speaking for industry now as a representative of the NAMF, this in no way is a delaying tactic on our part and I am not quite clear on what you mean when you say, in other words, if 2 years down the road or a year and a half down the road, we are into this and something else comes up we are going to ask for another 2 years or another 3 years. That is not the concept that we are talking about now. The problem we have right now is this: By April of 1984, we are required to meet certain categorical standards.

Mr. PACKARD. I understand.

Mr. RANNO. What we are saying here basically is there is innovative technology that we are presenting to Congress today that we are going to present later to the EPA and we are saying that not only can we meet these standards but we can do it better. We can keep businesses in business. We are not going to take the metals out of the water, put them into drums and then put them in the ground and 10 years later dig that ground up and put them across the street again. We have a better way of doing this. This is innovative technology to us as industry and in no way do we mean to imply a delaying tactic at all.

Now, I know I didn't quite answer your question as to what is to prevent us from doing that, but that is not the intention of this.

Mr. PACKARD. Well, I am not suggesting that it is the intention. I think, though, that this committee has always been a strong advocate of new technology and I don't think that you will see a change in that attitude on the committee, but nevertheless, we recognize that there is always a new technology that can be presented and there comes a point in time when you have to say we either meet the standards or we discard the standards and I think that that is what we would be looking at.

In other words, there is always the possibility that this new technology would not, within a 3-year period, be implementable on a broad scale to the industry and therefore another request for an extension and I think what I would be looking for is some assurances that this technology would meet the requirements or else you go to the old technology that has been proven. I suspect that is what I am suggesting in the question.

I am not anxious to see us constantly being requested for delays of another 3 years as we have seen in smog devices on automobiles and so forth because it isn't either cost effective to put this into practice, your procedures, or there is no other technology that might be better and more cost effective and therefore we need another 2 or 3 years to research and then ultimately implement that. I think that is my comment, sir.

Dr. SCHLOSSEL. May I comment further?

Mr. PACKARD. Certainly.

Dr. SCHLOSSEL. The technology that had been proposed in order to meet these standards is, as I am sure you know, precipitation of mixed metals. This produces a material which is a solid waste and which must go to land disposal causing a further problem because this is leachable material.

The alternative that we are proposing here and that we have gone through the process of producing a detailed design for produces no sludge, can meet the standards that are on the books now and probably do a bit better and it has the added advantage of being a much lower cost strategy.

Now, the estimates that the NAMF made and presented to me were that the costs associated with putting the precipitation strategy into place would cause approximately 40 percent of the job shop platers to close their doors. Our estimate is that the costs associated with this technology would result in less than 10 percent of the industry opting to close its doors, perhaps even closer to 5.

Now, in terms of applying technology, there is diminishing returns in that as well. If this technology actually does the job and the cost is reasonable, there is no reason to keep fishing for more.

In terms of your uncertainty, I would say that it is well founded, that there are many industries that have taken this particular tact. What I would suggest you do in formulating further legislation is provide statements in the legislation that require some kind of commitment and some kind of manifestation of serious involvement with this technology in order to take advantage of this delay and I think that can be written in.

Mr. PACKARD. I have taken more than 5 minutes, Mr. Chairman.

Mr. ROE. The gentleman from Wisconsin.

Mr. MOODY. Yes. Thank you, Mr. Chairman.

This recycling certainly raises an interesting prospect. If the recycling is as effective as you describe, then why would the metal finishers ever need an opt-out provision? You can simply recycle. You don't have to worry about the opt-out, would you?

Dr. SCHLOSSEL. I don't understand the thrust of your question, sir.

Mr. MOODY. Well, some metal finishers have indicated that they would like to opt out of the pretreatment program.

Mr. RANNO. I think I will attempt to address that. Your question comes from a different world that we have tried to stress here today. I stated in my testimony and for years NAMF has stated that it supports local control, opt-out provisions, et cetera, et cetera.

Mr. MOODY. Have you consistently asked for opt-out, correct?

Mr. RANNO. Yes, we have, but we have felt that that is the proper way to do the job correctly. We still feel that way.

Mr. MOODY. To do pretreatment yourself?

Mr. RANNO. No; not to do pretreatment ourselves, but to incorporate local control into the pretreatment amendments. We are here today, however, stressing the importance of innovative technology which is fairly recent. This is fairly recent.

I don't know if that answers your question.

Mr. MOODY. Well, it just seems to me that if you are recycling this and purifying it in effect, whatever you finally discharge is not going to create a problem. Isn't that true?

Mr. RANNO. That is correct.

Mr. MOODY. So why would you need the opt-out provision?

Mr. RANNO. Why would we need the opt-out provision if what we are discharging through this innovative technology would not present a problem?

Mr. ROE. If the gentleman would yield, I think for clarification when you use the terminology "opt out" you are speaking specifically there as to whether determined totally by a national standard or the local, meaning States and so forth, would be able to set their standards which may vary in part or shouldn't be lesser, of course, than the State standards. You are talking about being operated in some system relationship in a particular local area of the State?

Mr. RANNO. Yes, that is right, Mr. Chairman. Thank you.

Mr. MOODY. It doesn't seem to me as though you are going to have a problem if you have this recycling technology under control in either way.

Mr. RANNO. Well, we don't have that innovative technology yet. That is why we are here. That has not even bit into law yet. If we get into the law, I don't think we will have a problem. If we don't, we may have a problem. So it is a cart-before-the-horse situation.

Mr. MOODY. The other question, you know we had a mail metal finisher here from Connecticut a week or so ago, I think you will remember, and he was very forceful in saying that he did not think that the other metal finishers should be allowed to meet different standards than he has had to meet and he has gone ahead and invested and he is in competition with those who now perhaps would like not to meet the same standards and he felt it would be unfair to those who have gone ahead and met the problem head on and invested company money to meet standards.

Do you have any comments on that?

Mr. RANNO. Well, my comment to that would be that the standards that these electroplaters in Connecticut are meeting happen to be local standards. They have been meeting those standards for years. They happen to be the State's standards.

Now, if you are asking me is it inequitable that they should have to meet those standards and that we have to meet other standards, now we get into the whole subject of equitability and this is a very, very broad subject.

Mr. MOODY. Well, it is basically why should one metal finisher have to meet higher standards than another. If we want to put them on an even playing field, don't we want them to be meeting the same standards around the Nation? Why would we want to favor one over the other? It is not very complex.

Mr. RANNO. Are you talking economics now?

Mr. STANGELAND. If the gentleman would yield on that. I think we want to set an equal standard throughout the Nation so that we don't dislocate industry. But what a State chooses to do to its industry is another question and the standards in Connecticut supersede the Federal standards and what Connecticut is saying, make the Connecticut standards the standards for all of the United States to equalize. I am not sure that that is totally fair.

Mr. PACKARD. Would the gentleman yield further?

Mr. MOODY. Certainly.

Mr. PACKARD. I think that the role that this committee and the Federal Government ought to take is to do as we have been doing and that is to set a standard that is minimum for the country and then the State, of course, as Mr. Stangeland mentioned, has the option to change or alter that standard as long as it is not downward.

I think at least from my point of view, once the standard is established and it may relate to what you are suggesting, I don't care how you reach that standard, whether you use additional or a different technology than the standard technology that has been used for years or whatever, but I think that the standard ought to be what is required. I don't believe we ought to write into the law—and maybe that is not what you are asking, is that we write into the law a permit to use your system or your procedure to achieve the standard. I don't think that is the role of any law.

Mr. ROE. If the gentleman would yield, I think what they are saying is that we have used and have a special set-aside in the

basic fundamental law where we refer to the use of innovative technology. The fact of the matter is we even go so far, if my memory is correct, that we effect a partial bonus where there is a regular sewage disposal system involved or someone chooses to go onto innovative technology. What they are saying here, as I hear it, is that there should be a recognition that if we can use innovative technology, that would produce more economical and just as effective results that that ought to be recognized.

But I think what you are saying, which is concerning the gentleman from California, which has merit, is the fact that, OK, let's presuppose we would do such a thing. I don't think there is anything wrong with that request except that if it is, then we will go another 3 or 4 years then we do run into a problem. That is what you are saying, in other words.

Mr. PACKARD. That is right.

Mr. ROE. I think economically, if the gentleman would yield further, you come back and say, "Gee, it is a little bit crazy," to go into it this way but as the doctor is pointing out, the technology he is speaking to and the process is not true. The adaptation to this field is different. I understand it has been used many years in the chemical industry and many other industries as far as absorbing material and releasing it in whatever you are collecting. That is pretty much what you are talking about, isn't it?

Dr. SCHLOSSEL. Yes.

May I make a further comment?

Mr. ROE. Sure.

Dr. SCHLOSSEL. We have no regulations in California seeking to ban the land disposal of the very kind of hydroxide sludges that we are talking about that have been produced by the standard technology. My understanding is that we now have proposed or perhaps adopted amendments to RCRA to consider banning certain of these metals from land disposal nationally.

Mr. ROE. Right.

Dr. SCHLOSSEL. Now, what that would mean if we look at it full in the face is that all of these hydroxide precipitation systems, whether they be in Connecticut or Los Angeles or Chicago, would really no longer be useful because there would be no place to put the sludge. Now, what I would like you to consider is what the impact of such legislation would be, both in terms of its benefits on the environment, its negative impact on industry and also, gentlemen, is there a possibility of providing some financial support to members of the electroplating industry that would want to switch from the older technology to some innovative technology that would be far superior. Is that a possibility?

Mr. ROE. If the gentleman would yield, the committee is highly knowledgeable and has had expertise over the years technically and otherwise on exactly the point you are making. You make all kinds of sense. The idea that you have half a dozen pieces of legislation now are really contravening each other. You have the solid waste superfund situation and you get into the ocean dumping law.

There is legislation about to be introduced within the next 24 hours that says no more dumping in the 6-mile bite off the coast of New Jersey or 12 miles. You have to go out to 125. Why? Nobody knows these kinds of things. So, in effect, what is happening is that

as we are concentrating the waste materials involved, whether it be in the plating industry or any other type of toxic materials, we are now putting it into, talking about hot spots, we are putting it into a mass and now you have got to get a mass someplace. That is the problem we are having right now in Wayne on the disposition of the thorium materials on the low radiation work that was done 30 years ago by the W. R. Grace Co.

There are only three places in the Nation that are now eligible to dump that material and they are all national depositories.

Of course, there is another law that requires that States get together on finding some kind of regional State accommodations, as you know, and regrouping thereof where you would deposit within those respective States some kind of a low-level radiation place for disposing of this material. So, in effect, what is happening, the circle is shrinking and shrinking and shrinking and shrinking and people are speaking philosophically on a great many of these issues, but they are not looking at them and they are not able to understand.

Never mind the economics involved. What do you do when you concentrate the material and then you have to dispose of it someplace, somehow? When the testimony was given today, which was very good testimony from San Francisco, they brought this to very sharp focus without even realizing, I think they were doing it, the debate we have had around here for the last 5 years on making the elimination of combined sewers eligible as part of the grant process system which the Senate has been knocking out for the last 5 years and candor about it because they don't understand the technology involved.

If you are going to do this to a nonpoint source around the San Francisco area, which they are doing because they are eliminating the combined source which is a combination of storm water runoff and everything else coming down on the streets, they are already dealing with the nonpoint source as far as that issue is concerned, you see. The difficulty around here is partially political and political in this sense. I am not talking partisan politics. I think it is political from the point of view that there is emotion involved. More people know more things that are untrue about issues. I don't mean that unkindly. Many of them take a particular issue they have in mind and they could be dead right on it but it doesn't relate to the whole.

So simply what you are saying now, as I understand it, is that the present process being required to or the requirements to the plating industry is saying we are required under so-called known processes to concentrate our materials because that is what we are doing to get them out of the sludge from the pretreatment. That is what it is all about. What do we do with that material? Is there some better way of doing that, innovative technology; that is basically what you are saying.

In order to achieve that, you have a timeframe involved and your time is running out in 1984.

Dr. SCHLOSSEL. I would say further, sir, that in order to deal with the hazardous waste problem nationally that we should look to reprocessing to realistically reduce our discharge level by a factor of

100,000 and then we could detoxify and go to ultimate discharge with the remainder.

Mr. ROE. The committee understands what you are saying.

Are there any further questions?

Mr. MOODY. Yes. What I was trying to say about Connecticut, if I remember correctly, is that the gentleman from Connecticut was not saying Connecticut's standards should be nationwide. He is saying they have met BAT and they want to know why shouldn't everyone else have to meet BAT. It is a BAT/BPT controversy, not Connecticut versus other States. He was saying they have gone ahead and met BAT and now there is an argument that some people should be meeting BPT and he is saying that puts us at a competitive disadvantage.

Mr. RANNO. I realize I don't have the answer to that, but if I could just relate it. We are talking about equality here, if you will. Economic equality is really what they are talking about.

Mr. ROE. No, they are not. If the gentleman would yield. No, they are not. That is where you are losing sight of the point. What they are saying fundamentally is we have met the requirements that you require us under the law to do. Now, we are put at a competitive disadvantage because you have not forced everybody else to do that. If you want to tighten up the standards, we are not going to quarrel with that, but we want everybody else in the other 49 States to meet those same standards.

Converse to that, they are talking about an economic test. You are talking about an economic test, but those who are interested in cleaning up the environment are saying, "Hey, look at it." We understand there are economic tests involved and all of that. We understand that fully. That is not the issue before this committee, quote unquote. The issue is what do we do to clean up the poisons in our water supply?

This is not Bob Roe speaking. This is what is happening. If it hurts 20 percent of the manufacturers a lot of environmentalists say, "So what? They shouldn't be in business." It is rough, but that is exactly the way they feel about it. Those who can afford to do the treatment will survive and those who can't will not. The committee has not actually taken that approach because we recognize that there is a very serious economic impact.

The gentleman from Wisconsin.

Mr. MOODY. The tail is wagging the dog here.

Back to Dr. Schlossel's earlier point here about recapturing the metal. What about other toxics that aren't metallic? I am not a chemist. I am sure I am using the wrong word. Aren't there toxics that wouldn't be recaptured by metal recapture? You recapture mercury and cadmium, but aren't there toxics that wouldn't be recaptured?

Dr. SCHLOSSEL. There are other materials that are on the toxic list that wouldn't be captured by this process, but they are also not typically present in plating discharges. If there are other materials present, there are other technologies that can be employed with it in order to take care of these.

For instance, there are organics that are brighteners, catalysts, what have you, that are part of the plating process now and that in order to keep their processes going, electroplaters routinely repur-

ify their working solutions to take care of the degradation problems from these things so the technology available for removing those very low-level degradation products of organics that are part and parcel of these processes is carried out.

They are typically not, however, toxic materials.

The main materials that are a danger to the environment that we are working with are the heavy metals and they are cadmium, chromium, nickel, zinc, copper. Those have the typical ones you find in plating plants that we are looking at.

Mr. MOODY. Thank you very much, Mr. Chairman.

Mr. PACKARD. One quick question, Mr. Chairman, if I may. Is the pretreatment program that you are suggesting done at the plants or is it done at the wastewater treatment plants?

Dr. SCHLOSSEL. It is not done at the wastewater treatment plants at all. The metal leaves the wastewater stream before it enters the sewer so the first step of the process is done in the electroplating plant. That is, the value which is the metal commodities are removed from the waste stream before the waste stream goes into the drain. Further reprocessing is carried out centrally so this is not something that is carried out at a POTW.

Is that the question?

Mr. PACKARD. Yes.

The cost of the centralized system is borne by Government generally, is that what you would suggest, or by the private companies?

Dr. SCHLOSSEL. The current design does not specify who is going to bear the cost of that. In our situation, I can tell you what we are looking at, if you are interested.

In the northern New Jersey/Metropolitan New York area, there are significant interests at the port authority since they have a charter for jobs in the economic health of the region to bear some part of the cost of the central facility. Other regions could adopt whatever was appropriate to that local. If I compare the capital outlay for the combined central treatment plant and the capital investment at each plating plant that is still here by approximately a factor of five and the corresponding investment in the precipitation treatment at each plant would be——

Mr. PACKARD. Each treatment plant?

Dr. SCHLOSSEL. Each precipitation plant at each plater.

Mr. ROE. Mr. Stangeland.

Mr. STANGELAND. I would suggest to Mr. Ranno—and I am sorry I didn't hear your testimony and I can't bring to mind all the testimony from the metal finishers of last week—but I would suggest you might want to look at the testimony of Mr. Hiler of the Wyco Chromium Co. representing the metal finishers and analyze that. He made a very compelling statement and something that made an impact on the committee and you might want to take a look at that and see if what he says correlates with the proposal that you are talking about in your reprocessing and your recycling program.

Mr. RANNO. I will do that. Thank you.

Mr. ROE. Well, we thank you very much for obviously very stimulating testimony. We appreciate your thought processes and we will give every consideration to your recommendations.

You can get a copy of that testimony from our committee.

Mr. RANNO. Thank you, sir

Dr. SCHLOSSEL. Thank you very much.

Mr. ROE. Our next witness for today is Mr. Frank Rutland, vice president of manufacturing of the Armira Co. and a member of the TCA Technical Committee, accompanied by Dr. Robert M. Lollar, technical director at Tanners' Council Research Laboratory at the University of Cincinnati.

TESTIMONY OF FRANK RUTLAND, VICE PRESIDENT FOR MANUFACTURING, ARMIRA CORP., AND MEMBER, TANNERS' COUNCIL OF AMERICA TECHNICAL COMMITTEE, ACCOMPANIED BY ROBERT M. LOLLAR, TECHNICAL DIRECTOR TANNERS' COUNCIL RESEARCH LABORATORY, UNIVERSITY OF CINCINNATI; AND RICHARD SCHWARTZ, COUNSEL, TANNERS' COUNCIL, ON BEHALF OF THE TANNERS' COUNCIL OF AMERICA

Mr. RUTLAND. Mr. Chairman and members of the subcommittee, I am Frank Rutland, manufacturing vice president of Armira Co., a major leather tanner. My duties include responsibility for environmental affairs. As such, I have handled environmental matters in three States; Wisconsin, Iowa, and Tennessee.

In addition, I also serve on the Tanners' Council of America's Technical Committee and I am also currently chairman of the American Leather Chemists Association Research Liaison Committee.

I am appearing here today on behalf of the Tanners' Council of America, the trade association which represents the leather tanning and finishing industry in the United States. Our industry is concentrated in New England, New York, and the Midwest, but there are also a number of tanneries in California, New Jersey, Pennsylvania, and other parts of the country—totaling approximately 200 facilities.

I am accompanied by Dr. Robert M. Lollar on my right, technical director of the Tanners' Council, and manager of the Tanners' Council research laboratory at the University of Cincinnati. He is uniquely familiar with tanning wastewater treatment problems across the United States. I am also accompanied by Mr. Richard Schwartz, a Washington attorney specializing in environmental law who has represented the Tanners' Council in environmental matters for the past 10 years.

The tanning industry converts hides into leather, a very useful commodity—principally cattle hides, but also skins from pigs, sheep, and other animals. The industry uses solutions of various chemicals dissolved in water to clean the hides, tan, color, and finish the leather.

Wastewater treatment is an expensive part of our business. Therefore, implementation of the Clean Water Act is extremely important to us.

I am going to speak to you today about the following subjects—water quality standards; the need for congressional action on the fundamentally different factors variance for pretreatment facilities; and removal credits and sludge disposal guidelines for trivalent chromium. I will also briefly mention the following matters: the need to continue funding of the construction grants program;

the need to extend the 1984 BAT deadline; and the need for 10-year NPDES permits.

First, let me turn to water quality standards.

The Tanners' Council believes that section 302 of the act should be amended so that the States, too, in addition to EPA, are required to consider the costs of achieving water quality standards when setting NPDES permit limits. We also believe that the States should be given additional latitude to revise stream use designations under certain circumstances.

Let's talk about cost/benefit considerations that should be applied before setting permits limits together than best available technology.

In our industry, the problem of excessive treatment costs seems to be focused primarily on ammonia. Ammonia is not listed as a toxic pollutant, but most States set standards for ammonia in at least some streams. Most tannery wastewater contains ammonia and we have found that tannery wastewater is exceptionally difficult to treat for ammonia. Thus, the imposition of stringent ammonia standards in NPDES permits is very costly to our industry. In fact, EPA proposed an ammonia pretreatment standard for the leather tanning industry, but withdrew it because EPA could not identify a technology which would reliably remove the tanners' ammonia at a realistic cost.

For example, the publicly owned treatment works in Johnstown/Gloversville, N.Y., where there is a concentration of the tanning industry, needs to be upgraded. The first proposal for upgrading entailed a cost of $100 million. Of that sum, approximately $40 million was to meet an extremely stringent ammonia water quality standard for the receiving creek. Tanneries are encountering similar problems with the ammonia standards in other parts of the country.

In many cases, we do not believe that tight ammonia standards can be justified on environmental grounds. Moreover, in light of the tremendous cost of meeting those standards, we believe the States should be required to determine whether the benefit of attaining the standard is worth the cost.

One way to provide a forum for these considerations would be to amend section 302 of the Clean Water Act to require the States to make the same determinations as EPA when the agency issues NPDES permits where water quality standards require greater removal than that attainable by best available technology.

Second, I want to talk about instances where we feel that inappropriate stream standards may be in order.

It is important to note that in the cases confronting the leather tanning industry, the tanners do not seek to degrade the actual quality of the receiving stream. Like others who have appeared before you this morning, we want to make clear that we are totally in favor of the Clean Water Act and the efforts of Congress and this committee to improve the act.

In each case, after the limits in the new permit are attained, receiving water quality would be improved. We are seeking reconsideration of water quality goals which may never have been attained—and quite frankly never will be. These goals may have been adopted originally without any knowledge of their cost. It

may become apparent upon further scrutiny that these goals were ill-conceived, or not worth that cost.

First, the States should be given wider latitude to revise inappropriate designated uses. For example, the Nashua River in New Hampshire is classified as a salmon stream, even though its summer temperature exceeds 85 degrees Fahrenheit, a temperature at which salmon cannot survive. Other surface waters can never be fishable or swimmable due to such factors as drought flow, depth, temperature, and the basic geology and hydrology of the region. In such cases, the States should be permitted to revise the inappropriate use designation.

Second, some streams have been receiving industrial effluent for many years and are best suited for industrial uses. In fact, the flow of some streams consists primarily of industrial effluent, so without that effluent, there would be no stream much of the time. The States should be allowed to permit continued industrial use of such streams.

Finally, I want to comment that the States should be encouraged to revise water quality criteria based on stream studies. The States must establish water quality criteria—acceptable pollutant concentration limits—for streams based upon their designated uses. Pollutant loadings are allocated to streams so the applicable water quality criteria will not be violated. States should be encouraged to consider studies of the wildlife populations of specific receiving streams to determine whether the pollutant loadings allocated to that stream are overly stringent.

EPA's general water quality criteria, which are usually adopted verbatim by the States, were never intended to be taken as irrefutably accurate for all streams throughout the United States. Unfortunately, they are usually adopted without change because it is extremely expensive to conduct a study of a particular stream to determine what levels of pollutant loadings are in fact tolerable for that body of water. If a city, a State, or an industry is willing to undertake the expense of conducting such a study, however, the results should not be ignored.

Second, I would like to turn to the fundamentally different factors variance for pretreatment. Congress should restore the fundamentally different factors variance, which was vacated by the U.S. court of appeals for the third circuit on September 20, 1983. EPA relied on the availability of this variance when it devised the pretreatment standards for the leather tanning industry.

Effluent guidelines and pretreatment standards were issued for the tanning industry in the Federal Register of November 23, 1982. With respect to chromium, EPA recognized that "constraints on the availability of interior plant space and adjacent land" could be inadequate for the model chromium treatment technology on which these pretreatment standards were based. The agency concluded:

> Therefore, the agency believes that the more appropriate approach is to grant variances from the chromium pretreatment standard based upon a specific demonstration by the indirect discharger, as provided by the general pretreatment regulation of the fundamentaly different factor of inadequate interior plant space or adjacent land.

Thus, the availability of an FDF variance was one of the assumptions on which the leather tanning pretreatment standards were based. We know today at least three tanneries in the Milwaukee area have had their FDF applications returned to them by the Milwaukee Metropolitan Sanitary District as a result of the third circuit's decision. We suspect other tanneries are similarly adversely affected.

The basis for the court's decision was that section 301(l) of the Clean Water Act forbids the granting of variances for toxic pollutants. Section 301(l) provides as follows:

"The Administrator may not modify any requirement of this section as it applies to any specific pollutant which is on the toxic pollutant list under section 307(a) of this act." Presumably this preclusion was intended to apply to the economic variance—Section 301(c)—and water quality-based variance—Section 301(g).

Now, to the fundamentally different factor variance.

The FDF variance is different. The FDF variance does nothing more than permit EPA to establish appropriate limits for a particular facility based on the same technology considerations used to set the standard. An application for a FDF variance essentially requires a detailed engineering study showing the standards achievable by that particular facility at the pretreatment cost which EPA determined to be appropriate.

Because the standard itself was based on technological achievability—rather than a finding that greater discharge would harm the POTW—it is wrong to presume that a relaxation of the standard will harm the treatment plant. If such a danger in fact exists, the application would be denied by EPA or the local treatment works could impose a stricter standard under its own authority. Of course, a local POTW can always establish stricter limits to the extent it needs to protect its operation.

Third, I would like to turn to an issue that is specific to our industry: overregulation of trivalent chromium, removal credits, and sludge disposal guidelines.

Tanneries use and discharge chromium only in the trivalent form. It is universally recognized by toxicologists, and recognized in many EPA regulations, that trivalent chromium is much less toxic than hexavalent chromium. Trivalent chromium is an essential trace nutrient for humans. It does not interfere with POTW treatment processes. Trivalent chromium in tannery sludges does not cause ground water contamination problems when placed in landfills.

Finally, trivalent chromium has been found to be safe when applied in sludges to agricultural lands. In a study performend for EPA, the Oak Ridge National Laboratory concluded that trivalent chromium should not be a limiting factor in the application of sludges to agricultural lands.

Unfortunately, chromium is listed as a "toxic pollutant" under section 307(a) of the Clean Water Act without differentiating between the hexavalent and trivalent forms. Trivalent chromium has been tarred with the same brush as hexavalent. This situation raises the danger of overregulation under at least two sections of the Clean Water Act whose impact will be felt very soon.

The first of these is in the area of removal credits. Under EPA regulations, removal credits must be applied for within 18 months of the issuance of those pretreatment standards to which the credits will be applied. For the leather tanning industry, this results in a deadline of May 23, 1984.

Removal credits are mandated by section 307(b)(1) of the Clean Water Act. In essence, they permit relaxation of a pretreatment requirement for a toxic pollutant if the receiving POTW itself removes all or part of that pollutant from the effluent.

EPA issued a pretreatment standard for chromium discharged by tanners approximately 1 year ago. The pretreatment standard is based on settling of chromium-bearing solids by the tannery in a manner very similar to that which is commonly used by a POTW. In other words, this is a duplicative treatment process. In a well-operated POTW, removal of chromium will be 90 percent or higher. Thus, the pretreatment standard for chromium is a perfect candidate for a removal credit. In fact, EPA pointed to the availability of removal credits in response to criticism that a chromium pretreatment standard was inappropriate for the leather tanning industry.

To our knowledge, no discharger has yet received a removal credit for any parameter. Although our knowledge may not be complete, we are sure that if EPA's removal credits regulation has been used at all, such use has been rare. EPA's regulations make this process extremely complex and difficult. This fact has been noted by a report of the General Accounting Office in 1982 and a report by the House Subcommittee on Oversight and Review of the Committee of Public Works and Transportation in a report dated 1980.

Because EPA's regulations have made this process cumbersome, and because application is discretionary with the POTW, we fear many POTW's may not wish to take the immense time and effort required to make such an application. Often there will be no incentive for the POTW to do so.

If this problem occurs for the tanners, it will result in duplicative treatment for chromium and significantly wasteful expenditures. Accordingly, section 307(b)(1) of the act should be amended to permit the industrial discharger to make the removal credit application after giving notice to the receiving POTW. Second, the process should be made simpler and EPA's roadblocks to obtaining removal credits should be removed.

Second in this area is the question of sludge disposal. Heretofore, all studies of which we are aware have confirmed that tannery sludges can be put in landfills or spread on agricultural land without causing harm, or even potential harm, to the environment. Tanners in many different States are conducting experiments with the application of their sludges to agricultural lands. The environmental impact of this process is being monitored to demonstrate that it can be used safely and beneficially. Tannery sludges are rich in nitrogen which is an important soil nutrient. Thus, this process may prove to be an inexpensive, environmentally sound, and agriculturally beneficial method of sludge disposal.

Regulations issued in the near future under the Clean Water Act could either help or impede this process. Under section 405 of the act, EPA is authorized to issue guidelines for the disposal of sewage

sludges. These guidelines will include the identification of concentrations of pollutants which interfere with each designated use or disposal of sludge.

We understand that the Senate is considering an amendment to section 405 of the act to require EPA to expedite the process of issuing sludge disposal guidelines under section 405. We urge you to direct EPA to avoid setting standards under section 405 which unnecessarily limit the beneficial reuse of sludges by land application. Often EPA is given wide latitude to issue overly strict regulations. Directions such as those in section 307 to provide an "ample margin of safety" without regard for the wisdom of an undue restriction could frustrate the development by the tanning industry of sludge disposal options which are both environmentally safe and economically efficient.

Now, let me turn to the funding construction grants program. Some tanneries discharge directly into navigable waters. Often these tanneries are located in rural areas or other places where there is sufficient land to accommodate the waste water treatment equipment needed to meet effluent guidelines. Most tanners, however—probably 95 percent or so—discharge to POTW's. A great many of these are operating from old plants in urban areas where they do not have the space to treat their effluent to the extent necessary to discharge directly to the navigable waters. For these tanneries, there is no option but to discharge to the local municipal treatment plant. Many of these municipal plants need to be upgraded and cannot do so without Federal funds.

Accordingly, we support continued funding of the construction grants program under title II of the Clean Water Act. Without such funding, many urban tanneries would have to cease operation. Aside from the particular effect on tanners, cessation of this program would cause severe economic dislocation in many urban areas.

Next, I want to speak on the July 1, 1984, best available technology deadline.

The Tanners' Council supports an extension of the existing deadline for installation of best available technology. The effluent guidelines for the leather tanning industry were issued on November 23, 1982, which is only approximately 1½ years prior to the July 1, 1984, deadline. Moreover, in part because of the delay in issuance of effluent guidelines, most direct-discharging tanners do not yet have their final NPDES permits which will determine the limits which they must meet.

Accordingly, we support an extension of the July 1, 1984, deadline to 3 years from the date the NPDES permit is issued or at a minimum, July 1, 1988. This extension should give the leather tanning industry adequate time to install best available technology to achieve the limitations in the next round of NPDES permits.

Finally, let me touch on the point of permit duration. The issuance of an NPDES permit is a major undertaking. It involves extensive sampling of the industry's effluent, an evaluation of the water quality standards which should apply to the receiving stream, the suitability of variances for certain limitations, and numerous other terms and conditions which apply to any NPDES permit.

Second, the installation of treatment technology is a major expense for a leather tannery. No tanner can endure such a major capital expense every 5 years.

Accordingly, the maximum term of an NPDES permit should be 10 years.

Thank you very much for listening to our comments on the Clean Water Act. Dr. Lollar, Mr. Schwartz and I will be happy to answer any questions you may have.

Mr. ROE. We thank you, Mr. Rutland, for your in-depth testimony.

Mr. STANGELAND. I have one question, Mr. Chairman. It was suggested, and you suggested, the fundamentally different factor variances, but it was suggested yesterday that these variances are not needed because any problems that exist could be addressed by EPA through the creation of new industrial subcategories and accompanying regulations. How would you respond to that argument?

Mr. SCHWARTZ. As a practical matter, that would put an incredible burden on EPA. In other words, they have just gone through an incredibly long rulemaking proceeding for the leather tanning insustry to issue effluent guidelines and pretreatment standards. The chance of them going back to reopen that to create new subcategories, I think, is minimal. The administrative burden would be such that they just wouldn't do it.

Mr. ROE. The gentleman from Arizona.

Mr. MCNULTY. No questions.

Mr. ROE. Thank you very much. Your statement is very comprehensive.

Just one thing. What do you see about those credits? You spoke to the issue of the removal credits and it is very interesting because that has been talked about here as being sort of a panacea, but to your knowledge there has been none given at all that you are aware of?

Mr. RUTLAND. No, we are not aware of any. Obviously we don't know every situation in the country.

Dr. LOLLAR. There are none in the tanning industry.

Mr. ROE. So it is something that is floating around there?

Dr. LOLLAR. If the EPA's proposed removal credit which has been set aside now in the Third Circuit Court were to become effective, I have reason to believe that some removal credits would be approved. That is part of the simplification that we think ought to be accomplished.

Mr. SCHWARTZ. I think the existing removal credit provision has a lot of problems. I think, for example, one of the loudest opponents of the existing provision is the sanitary district of the city of Chicago. They basically say the program is unworkable, and they won't even try to get removal credits for anybody.

If you have that many industrial discharges being held hostage to what is considered to be an unworkable regulation, I think they hope something will be done about it.

Mr. ROE. Do you think it is unworkable?

Mr. SCHWARTZ. It is hard to say. It hasn't worked yet. What happened is EPA, when Congress wrote in a removal credit provision that said if there is removal by the POTW you give credit for it, but when EPA wrote the regulations, they held a lot of other

things hostage to granting removal credits. They said you can grant removal credits, but you have got to have a local pretreatment program and you have got to have a program to correct your combined sewer overflow problems, and you have to have a year's worth of data on influent and effluent removals.

Then when they said the credit you are going to get originally was going to be based on the average of the lowest 50 percent of the removals, they basically did everything they could to minimize the credit and make it very difficult to get it.

What happened was that in the pretreatment case, the third circuit approved the existing program to the extent it said it was not arbitrary and capricious, et cetera. But up until now, nobody has gotten one, and I think the idea that it is a panacea is probably the last thing that you could reasonably say about it.

Whether it will work depends on a couple of things. One is that on EPA's regulatory calendar they still have on the agenda modification of the existing removal credit provision and we don't know how that is going to come out, and I think our fear is that the third circuit, having said from a judicial standpoint they can't find any legal objection with what was done before, there is going to be very little incentive now for EPA to deal with the practical problems that everybody has been screaming about.

Hopefully we will know in January, but even then the situation is that the deadline for the tanning industry, no matter what EPA does, is May 23, and it is going to be very, very difficult for anybody even to get a proper application in by May 23 and changing the program in January, even if it happened then, might be too late for the leather tanning industry.

Mr. ROE. What did you see the delay to be caused by?

Mr. SCHWARTZ. The delay by EPA; I know what it is caused by. Their proposal was to simplify it by having a national removal credit program. And what they did was they had something called the 40 POTW fate study where they took 40 POTW's which they considered to be well managed and well operated and took the average removal for various toxic pollutants and said, just to make this process workable, we will give you, instead of having to give us all this data, we will give you that average removal automatically. Automatically is probably oversimplifying, but that would be a number that you could get without jumping through quite as many hoops as you would otherwise have to.

The problem is that they found out the study was lousy basically, and so they didn't know what to do. And for the tanning industry the study was doubly lousy because it was placed on POTW's that didn't have tanneries going into it and tannery chromium is very easy to remove because it is bound up with suspended solids.

So in any POTW, generally the first process that it has is a settling pond which settles out suspended solids for tannery chromium; when it does that it takes out the chromium. So as we said in the testimony, a POTW that is well operated is going to remove about 90 percent of the tannery chromium.

Well, when they did the study, because they didn't use POTW's that had tanneries going into them, they were doing influent/effluent comparisons for percent removal, and they might have had many, in fact they did have many POTW's where there is very

little chromium going in in the first place and very little came out, but the percent removal, of course, was very, very low.

So, when they averaged that all in, percent removal for chromium was much lower than you would get for tannery chromium, and so that is a particular problem for the tanning industry, but there were other defects in the study, the details of which I am not aware that made EPA stop, and they just didn't know what to do, and I think that caused the delay up until now.

Mr. ROE. How do you expect to be in compliance by May of next year? Do you want to sit here?

Mr. SCHWARTZ. Well, certainly. Could I have a vote?

Mr. ROE. That doesn't go with the offer.

Mr. SCHWARTZ. The May 23 deadline is to make the application. The final compliance deadline is November 25, 1985.

Mr. ROE. By the same token, in order to make an intelligent and well-rounded and productive application, you have got to have some facts to make it on.

Mr. SCHWARTZ. That is right, and that is a problem.

Mr. ROE. Do you feel comfortable enough without getting into hot water to answer the following question? Do you feel that EPA has been responsive to the needs of the tanning industry in establishing guidelines and criteria that are practical and can be met in a reasonable way?

Mr. SCHWARTZ. Well, we are in litigation with them, so the answer has to be limited. I think in some respects yes, and in some respects, no. I think, to be extremely candid, the methodology which they used to set the standard, the way they gathered the data, and the quality of data was terrible. Every once in a while they came out with the right answer, even though the way they gathered the data and the reliability was actually awful.

Mr. ROE. I am really leading to a serious question. We have 3 more days of this to go. When we listen to the testimony time and time and time again from the different categories of industry that testify, the platers, the tanners, whatever, with all of the deadlines involved, they have not been provided with the information that they need for the standards or criteria.

Mr. SCHWARTZ. That is right.

Mr. ROE. So two proposals are emerging as we have seen in the testimony. One is coming back and saying, "All right, instead of waiting until all of those criteria are promulgated then, as a set of rules and regulations are promulgated for one area, make the decision and let the 3 years starting at that point." I think that is what industry is saying.

Mr. SCHWARTZ. That is particularly a pretreatment problem. What they are saying is as the pretreatment standards dribble out, if they have discharges in three different categories, the clock has started ticking after they issue the first one, and the number keeps getting revised every time a new pretreatment regulation comes out in a different category.

Mr. ROE. When Congress said the basic rules and the basic programs since 1972, they assumed, and it sounds like I am coming down on EPA and I probably am, they were supposed to do certain things in a given period of time and if they did those things in a given period of time, the industry had that data available to them

and they could start making decisions or midcourse corrections, or whatever the case may be.

But if it has been 10 years and you still don't have the information, we can't really get all worked up about industry not complying if they haven't been given the information to base their decisions on in the first place. Isn't that reasonable?

Mr. SCHWARTZ. Yes. That is what has happened, and I think right now there are a lot of very tricky questions, particularly for pretreaters, because they were supposed to file a baseline report and the way the rules read, you have got to file the baseline report and commit to construction even before you know whether you are going to get a removal credit which is a very, very serious thing, and this has happened to the tanners.

Mr. ROE. Well, should we scrap the removal credit item? It is not working anyway.

Mr. SCHWARTZ. We would love to have it work, and there are tanners who are applying and hope that it will work out and they will get one. But the way the regulations are written, they are supposed to, and EPA wants those to be applied literally because we have raised this with EPA that the way the baseline report works, you are supposed to start on a construction schedule immediately and build as soon as possible after the regulations come out. The maximum intervals are supposed to be 90 days, and there is no provision for waiting to find out whether you are going to get a removal credit.

So the problem is if you take the regulations literally, even if you had a removal credit application in, you would have to start building before you found out what the answer was, and I am afraid that industries have gotten around it by fudging it. Really is a ridiculous result, and people live with it the way they can, but unfortunately from a practical standpoint, one of the acceptable answers is not provided in the regulations because they clearly say you have got to start building today and without regard to removal credit applications even if you know that the POTW is removing, let's say, 90 percent of your chromium for tanners.

And this applies to the steel industry equally, by the way. They have got roughly the same timing problem. Even though you know the POTW is removing it, even if you could walk up and show boatloads of data showing there was removal, if you followed EPA's pretreatment regulation literally the way they wish to have them applied, you still have to start building pretreatment facilities as if you were not getting the removal credit.

Mr. ROE. No further questions. I want to thank you very, very much for your testimony.

Our next witnesses today are the American Petroleum Institute, represented by Mr. Ken Blower from Standard Oil of Ohio, and Mr. William Manning, Louisiana Land & Exploration Co.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

Statement of
KENNETH E. BLOWER, THE STANDARD OIL COMPANY OF OHIO

on behalf of the
AMERICAN PETROLEUM INSTITUTE

before the
HOUSE SUBCOMMITTEE ON WATER RESOURCES
PUBLIC WORKS AND TRANSPORTATION COMMITTEE
U.S. HOUSE OF REPRESENTATIVES

Hearing on
CLEAN WATER ACT AMENDMENTS OF 1983

November 10, 1983

EXECUTIVE SUMMARY

The American Petroleum Institute supports amendments to the Clean Water Act which will eliminate costly delays and unnecessary expenditures and make the act more workable and flexible. Our statement discusses provisions of H.R. 3282 and S. 431 as well as certain provisions of the Clean Water Act that the Senate and House bills do not address.

Compliance Dates

API believes that the July 1, 1984 deadline for compliance with Best Available Technology and Best Conventional Technology effluent guidelines should be deleted and that compliance should be required 36 months from the date guidelines are established.

H.R. 3282 uses this approach for toxic pollutants but requires a deadline of July 1987 for conventional pollutants. The Senate bill sets a fixed deadline of July 1987 or earlier for all pollutants.

Experience has shown that fixed dates do not provide a workable approach -- the result, too often, is the need for another extension of the deadline.

Water Quality Standards

Section 6 of H.R. 3282 and comparable provisions of S. 431 which address water body use designations and protection of high quality waters are not necessary and should be dropped. The provisions were introduced in response to concerns of the environmental community and some members of Congress with certain aspects of EPA's proposed water quality standards regulations. However, EPA has since revised those portions of the regulations, and according to Senators Stafford, Chaffee, Randolph and Mitchell, "the final regulations reflect the requirements and policies of the Clean Water Act" and "the provisions of S. 431 governing the setting of standards and maintenance of high quality waters appear to be no longer necessary."

In addition, both bills require states to adopt numerical water quality criteria for toxic pollutants when water quality is impaired. The Association of State and Interstate Water Pollution Control Administrators have called the requirement to list toxic substances and develop national criteria an "unrealistically simple solution" because the list of pollutants could be expanded indefinitely. API opposes this provision since it would arbitrarily preempt sincere efforts underway to evaluate the proper role of biological versus numerical criteria for protection of aquatic life.

20-955 O—84——157

Control of Toxics After BAT Attainment

Section 7 of H.R. 3282 and comparable provisions in S. 431 which address additional controls after Best Available Technology (BAT) has been achieved are unnecessary and should be deleted. The Clean Water Act already provides a mechanism for achieving water quality standards where BAT controls for toxic pollutants would not adequately protect water quality.

More important, the proposed amendments would prove ineffective for these reasons. First, the amendments would provide an inflexible strategy with unrealistic and rigid time tables. Second, the proposals rely solely on the control of industrial and municipal discharges and do not address the pollution caused by non-point sources.

Finally, the House proposal would transfer the states' traditional authority to develop water quality-based effluent limitations to the EPA administrator. API believes the states, with appropriate oversight and guidance from EPA, are better equipped to make the necessary decisions regarding the most cost-effective and rational strategies for achieving water quality. In fact, the states, EPA and industry are currently engaged in earnest efforts to create an effective and workable approach to control toxic pollutants.

The National Pollutant Discharge Elimination System (NPDES)

All facilities must obtain an NPDES permit before discharging pollutants into the nation's waters. However, the act requires EPA and the states to renew permits too frequently and to issue permits for sources which are insignificant contributors to water pollution. The Senate bill S. 431 has addressed these concerns with provisions that would extend the maximum lifetime of a permit to 10 years and exclude certain categories of stormwater runoff from the permit program. API supports the intent of these amendments but believes that some modifications are needed to make the amendments more workable.

Other Major Clean Water Act Issues

API believes that three other troublesome aspects of the Clean Water Act, not addressed by either the House or Senate bills, need to be considered.

The Treatment of New Sources

Two aspects of the act's requirements for new facilities are inefficient and costly: the definition of a new source and the requirement for preparation of an Environmental Impact Statement (EIS) when an NPDES permit is obtained.

A facility is defined as a new source if its construction is begun after an applicable performance standard is proposed.

Although final standards are to be promulgated within 120 days, in practice, EPA has not met this requirement. Thus, industry must design new plants to meet proposed effluent standards which EPA often changes as a result of public comments. Changing the definition of a new source to the date an applicable new performance standard is final rather than the date it is proposed would eliminate uncertainty and unnecessary expenditures.

The EIS requirement is intended to ensure that federal agencies adequately address environmental considerations. For NPDES permits, this costly requirement is redundant because environmental concerns already play a paramount role in EPA's decisions.

Application of Ocean Discharge Criteria

The "Ocean Discharge Criteria" requirements of Section 403 of the act duplicate other important environmental controls that already protect the ocean from unreasonable degradation. For example, several steps are required for oil and gas drilling on the Outer Continental Shelf. These include: an Environmental Impact Statement assessing the environmental effects of the proposed activity; an NPDES permit which imposes technology-based treatment requirements; a site-specific plan of exploration and an environmental report; a production plan and another environmental report; and, for a new producing area, another Environmental Impact Statement.

Section 403 should be modified to eliminate redundant environmental impact assessments.

Best Available Technology Requirements

In order to avoid "treatment for treatment's sake," the act's requirements for more stringent technology should be re-evaluated. For many industries, existing technology is effectively removing toxic pollutants present in raw waste waters. In these cases, more stringent industry-wide requirements should not be necessary. Further, the concentration of a pollutant which will produce a toxic effect on aquatic life in the receiving water varies from stream to stream and pollutant to pollutant. Therefore, the act should allow case-by-case modification of national guidelines in those limited circumstances where a discharger can show that the effluent from its facility does not violate water quality or adversely impact the receiving waters.

Testimony presented before the House Subcommittee on Water Resources, Washington, D.C., November 10, 1983

I am Kenneth E. Blower, Manager of Environmental Affairs for The Standard Oil Company of Ohio. I am representing the American Petroleum Institute (API) as chairman of API's Water Program Committee.

The Institute welcomes the opportunity to present its views on amendments to the Clean Water Act.

Our statement addresses provisions of H.R. 3282 and S. 431 relating to:

- Compliance Dates
- Water Quality Standards
- Control of Toxics After Attainment of Best Available Technology
- The National Pollutant Discharge Elimination System Permit Program

In addition, our statement dicusses provisions in the Clean Water Act that the Senate and House bills do not address. We urge you to consider improvements needed in these areas:

- Treatment of New Sources
- Ocean Discharge Criteria
- Best Available Technology Requirements

I. Compliance Dates

API supports the current congressional effort to extend Best Available Technology (BAT) and Best Conventional Technology (BCT) compliance deadlines. But we are concerned that the use of fixed dates in both the House and Senate bills will serve to continue the problems encountered with past and current deadlines. We believe that fixed deadlines should not be imposed and that compliance should be required 36 months from the dates BAT and BCT effluent guidelines are established.

H.R. 3282 uses this approach for toxic and non-conventional pollutants, requiring compliance three years after BAT effluent limitations are established for these pollutants. However, a fixed compliance date of July 1987 is required for conventional pollutants. The Senate bill requires compliance with effluent limitations for all pollutants by July 1987 or earlier.

The fixed dates in both the House and Senate bills will create problems for many industrial facilities. It can take at least three years from the time EPA promulgates effluent limitations for industry to design, purchase and install required technology. Thus, in order to comply with a July 1987 deadline, all limitations would need to be promulgated by July 1984.

However, EPA will not have enough time to promulgate limitations for many industries by that date. BAT limitations for some industries and BCT regulations for most industries have not been promulgated. Moreover, promulgation schedules have historically been subject to substantial slippage.

For example, EPA is developing BAT and BCT guidelines for the oil and gas extraction segment of the petroleum industry but has not set the date when those guidelines will be issued. Because this category is not covered by the strict schedule of the Toxics Settlement Agreement, the final guidelines will most likely be issued after July 1984. Therefore, depending on the exact requirements of the BAT guidelines, this segment of the industry may not have enough time to comply with the dates in H.R. 3282 and S. 431.

Continuing to schedule fixed dates for compliance only ensures that some industries will run into trouble and that another extension of the deadline will be necessary in the future.

II. Water Quality Standards

Both H.R. 3282 and S. 431 address water body use designations, protection of high quality waters, and the imposition of numerical water quality criteria for toxic pollutants.

A. Use Designation and Protection of High Quality Waters

Both bills would require any water quality standards revised after January 1, 1983, to maintain the designated uses in effect on that date. Less restrictive uses may be set if the existing use is not attainable because of natural background or irretrievable man-induced conditions or if controls beyond the application of BAT would result in substantial and widespread adverse economic and social impact.

Both bills would also require the states to upgrade a water body's designated use if water quality exceeds the existing use and to maintain and protect water quality which exceeds levels needed to support fish, shellfish, wildlife and recreation.

These provisions are not necessary and should be dropped. Introduction of these amendments was prompted by EPA's October 1982 proposal to revise its water quality standards regulations. Certain aspects of that proposal created concern among members of the environmental community and among some members of Congress. EPA has now changed those aspects of concern and according to Senators Stafford, Chaffee, Randolph and Mitchell "the final regulation reflects the requirements and policies of the Clean Water Act. ..." Moreover, congressional attempts to codify these complex regulations would eliminate much of the needed flexibility still contained in the regulations.

B. Role of Toxics in Use Attainment

The House bill would require the states to adopt numerical criteria for toxic pollutants when revising water quality standards. Numerical criteria would be required for each toxic pollutant which could interfere with the attainment or maintenance of the water quality needed to support designated uses. The Senate provision similarly requires the adoption of numerical criteria for toxic pollutants.

API opposes this provision since it would arbitrarily preempt sincere efforts now underway to evaluate the use of biological versus numerical criteria for protection of aquatic life..

The provision would mandate an enormously complex and expensive scheme for dealing with toxic pollutants with little certainty as to its feasibility or effectiveness. The major voice of the state regulatory community, the Association of State and Interstate Water Pollution Control Administrators, for example, has questioned the numerical criteria approach for toxic pollutants. They have called the requirement to list toxic substances and prepare national criteria an "unrealistically simple solution." They point out that the list of pollutants is expected to expand indefinitely and that this type of scheme would involve a massive new nationwide monitoring program.

EPA and the scientific and technical community are still grappling with the proper role of biological versus numerical criteria for toxic pollutants. A statutory provision at this time could significantly set back progress being made.

III. Control of Toxics After BAT Attainment.

The provisions in both the House and Senate bills mandate an inflexible strategy with unrealistic time tables for the imposition of water quality-based effluent limitations for discharges to waters which are not expected to achieve fishable/swimmable quality -- even after BAT controls on toxic pollutants are in place.

API believes that these provisions are counterproductive and unnecessary and recommends that they be deleted. The act already provides a mechanism for achieving water quality standards where BAT controls are found to be inadequate. Relying on existing authority under the act, EPA has been working diligently to refine its water quality programs to address this problem and to provide guidance and assistance to the states.

EPA has recently developed a draft "Policy for the Development of Water Quality-Based Permit Limitations for Toxic Pollutants" (9/8/83). The policy addresses the need for additional controls on toxics once BAT has been implemented. Briefly, EPA proposes an integrated strategy consisting of both biological and chemical methods. This means that, in addition to enforcing specific numerical criteria, EPA and the states will use biological techniques and available data on chemical effects to assess toxicity -- with the goal of "no toxic materials in toxic amounts."

The Clean Water Act currently gives EPA authority to proceed. For instance, NPDES permit applicants can be -- and are being -- required to provide chemical and biological data. EPA and the states may call for aquatic toxicity testing after the required technology has been installed and may reopen the permit to incorporate additional limitations if needed to correct receiving water problems.

In the past, Congress has restrained from modifying statutory programs until EPA, the scientific community and the public have had an opportunity to develop workable programs. As the House Subcommittee on Oversight and Review of the Committee on Public Works and Transportation observed in its Report on Implementation of the Clean Water Act (December 1980, p. 61):

> The history of the toxic-control program inaugurated in 1972 is a classic case of demanding too much, too soon and winding up with too little, too late. ... If the question is [whether we should] demand less than what

> our known capabilities will produce, the answer is a resounding no. ... And if the question is whether our ultimate water quality goals should be lower, the answer is the same. However, if the question is interpreted as focusing our demands on objectives capable of achievement, then the answer is yes. ... The history of this program shows that the asking-for-everything-at-once approach has produced enough confusion and inefficiency to have all too often slowed, rather than accelerated, the achievement of our goals. Greater demands produce greater results only up to a point.

In light of the tangible progress that is being made to address toxic pollutants, Congress shoud continue to exercise restraint for just a bit longer to allow a fair appraisal of current efforts.

IV. The National Pollutant Discharge Elimination System

The National Pollutant Discharge Elimination System (NPDES) Permit Program needs to be made more manageable by extending the maximum lifetime of permits to 10 years and excluding insignificant discharges from the permit program. API believes that S. 431's provisions addressing these problems need to be somewhat modified.

A. Extending the Maximum Lifetime of NPDES Permits

API supports the Senate's effort to extend the maximum lifetime of NPDES permits. However, one aspect of S. 431's Section 10 could largely eliminate the benefits to EPA, the states and industry of a 10-year permit term -- the requirement that existing permits be promptly modified whenever new or revised requirements that are more stringent than any in the permit are established under numerous other sections of the act.

The Clean Water Act already gives EPA the authority to reopen permits. Section 402(b)(1)(C) of the act allows EPA to modify or terminate a permit for cause. EPA has exercised this authority by requiring that permits be re-opened if more stringent requirements for toxics are established under Section 307 of the act. S. 431's provision would require permits to be reopened if more stringent requirements are established under Section 307 as well as sections 301, 302, 303, 304, 306, 403 and 405 of the act.

This provision would not allow EPA or the states to consider the significance of a more stringent requirement before deciding whether a permit should be reopened. Thus, for example, regulations involving toxic, conventional and non-conventional pollutants would be treated the same and would require in all cases that the permit be reopened. EPA and the state agencies would be swamped by this task and industry would lose any certainty of the duration of permit requirements. Thus the potential benefits of a ten-year permit lifetime would be lost.

API recommends that Section 402(b)(1)(B) of the Clean Water Act be amended to read as follows (changes are underscored):

> "(B) except as provided under paragraph (C) of this subsection, are for fixed terms not exceeding ten years, unless a permit includes a waiver or modification of any otherwise applicable requirement pursuant to Sections 301(c), (g), (h) and (m) of this Act, in which case such permit shall be for a fixed term not exceeding five years;".

Where a facility is granted an economic or water quality based waiver under the act, the permit lifetime would still be limited to five years. However, other minor modifications would not prevent a facility from obtaining a ten year permit.

The amendment recommended by API would allow a 10-year permit term that corrects the problems encountered with the five-year term. The existing five-year maximum lifespan for NPDES permits has imposed unnecessary burdens and costs on industry, EPA and the states alike. It may take as long as a year for a final permit to be issued. Up to three years may be required to install treatment technology necessary to comply with permit conditions. This scenario leaves little time to obtain data on effluents before the permit has to be renewed.

It has been estimated that about 65,000 permits have been issued since 1972.[1] EPA and the states are now facing an increasing backlog of permits which have expired and must be reissued. This problem could be alleviated in the future by amending the act to provide permit authorities the flexibility to issue permits for terms up to 10 years.

Moreover, the 10-year lifetime would make the NPDES permit program more consistent with permit programs enforcing other environmental laws. Congress has not placed restrictions on the duration of permit terms under the Resource Conservation and Recovery Act and the Clean Air Act.

B. Excluding Insignificant Discharges

S. 431's Section 13 recognizes the need to exempt from the NPDES permit program discharges that have little or no adverse impact on water quality. The provision exempts discharges of stormwater runoff from mining operations and oil or gas exploration, production, processing, or treatment operations that are not contaminated with process wastes, overburden, raw

---

[1] Deputy Administrator, Dr. John Hernandez, Jr., U.S. Environmental Protection Agency, Testimony before the Subcommittee on Environmental Pollution, Senate Committee on Environment and Public Works, February 5, 1982.

materials, toxic pollutants, hazardous substances in excess of reportable quantities, or oil or grease from the Clean Water Act's requirement to obtain an NPDES permit.

However, the proposed language fails to explain what constitutes "contaminated by oil or grease." API recommends that line 17 of Section 13 be changed to read "or oil or grease in excess of reportable quantities." This is the phrasing used to define "contamination by hazardous substances."

In addition to the specific exemption provided by Section 13 of S.431, Congress should consider amending the act to provide authority for EPA to exempt other environmentally insignificant discharges from the NPDES permit program. That is, EPA should be allowed (a) to exempt appropriate discharges from categories of point sources and (b) to exempt specific point source discharges on a case-by-case basis.

A Clean Water Act amendment excluding insignificant discharges from the NPDES permit program will help address a problem that EPA, state agencies and industry have all acknowledged. Thousands of insignificant discharges are currently regulated under the NPDES permit program. Faced with the enormous task of renewing permits for major point sources, permit issuing authorities probably will not be able to act on most minor discharge permit applications during the next several years.

During the first round of NPDES permit issuances under the Federal Water Pollution Control Act of 1972, EPA attempted to exclude many stormwater discharges containing insignificant quantities of pollutants from NPDES permit requirements. This exclusion was challenged by the Natural Resources Defense Council (NRDC) which claimed that EPA had no authority under the act to exclude any point source discharges of pollutants.[2] The court agreed with NRDC, and, as a result, EPA now believes that it has little or no discretion in its application of the permit program. Based on a survey of 39 states, the Association of State and Interstate Water Pollution Control Administrators in May 1979 reported that a total of 5,808 major and 36,090 minor NPDES discharge permits had been issued to both industrial and municipal dischargers. The report stated: "About 51 percent of all permits issued ... involved relatively insignificant facilities with respect to point source pollution concerns."[3] In spite of EPA's efforts, thousands of permit applications (some submitted as long ago as 1972) for small sources are still pending.

---

2 NRDC v. Train, 396 F.Supp 1393 (D.D.C. 1975), aff'd. NRDC v. Costle, 568 F.2d 1369 (D.C. Cir. 1977).

By excluding insignificant discharges from NPDES permit requirements, both industry and government will be able to better focus on eliminating major sources of pollution from the nation's waters.

V. OTHER CLEAN WATER ACT ISSUES

The American Petroleum Institute believes that the following aspects of the Clean Water Act need to be modified to eliminate costly delays and unnecessary expenditures of limited resources.

- The Treatment of New Sources
- Application of Ocean Discharge Criteria
- BAT Requirements

A. The Treatment of New Sources

API recommends that (1) the definition of a new source be based on the date an applicable new performance standard is promulgated, rather than on the date it is proposed; and (2) NPDES permits for new sources be exempted from review under the National Environmental Policy Act and its associated requirement for preparation of an Environmental Impact Statement (Sections 306 and 511).

1. Definition of a New Source. The Clean Water Act defines a new source as any facility whose construction is begun after the proposal of an applicable new source performance standard. Therefore, any facility meeting this definition must design and construct pollution control technology to comply with the proposed standard.

This situation creates more than just uncertainty for industry. Considerable resources can be expended in designing facilities to comply with proposed standards. Yet substantial changes in the performance standard often occur between proposal and final promulgation. Although EPA is required by law to promulgate new source performance standards within 120 days of their proposal, delays of months and even years are not uncommon. Thus, industry is required to design new plants to meet proposed standards which EPA may later change.

For example, new source performance standards for the Petroleum Refining Category were proposed on December 21, 1979. The standard required zero discharge of process water. On October 18, 1982 -- almost three years later -- final standards

---

3 Association of State and Interstate Water Pollution Control Administrators, "Recommendation for an Improved National Water Quality Program," Washington, D.C., 1979.

for new source refineries were promulgated. EPA substantially modified the zero-discharge requirement because, as EPA noted, it would "generate significant adverse non-water quality environmental impacts . . . with only marginal additional water pollution reduction benefits."[4]

2. NEPA requirement for New Sources. Under Section 511 of the Clean Water Act, issuance of an NPDES permit for a new source is subject to the National Environmental Policy Act (NEPA) and can require the preparation of an Environmental Impact Statement (EIS). This EIS requirement is time-consuming, costly and redundant.

The EIS requirement is intended to ensure that federal agencies address environmental considerations when evaluating a proposed action. However, with EPA deciding on new source permits, environmental concerns are paramount. Moreover, EPA's permit issuing process for new sources provides opportunity for public comment on any potential environmental consequences.

Exempting new source permits from the EIS requirement of NEPA would make the Clean Water Act consistent with other environmental statutes. The Clean Air Act, the Safe Drinking Water Act and the Resource Conservation and Recovery Act are already specifically exempt from EIS requirements.

B. Application of Ocean Discharge Criteria

API recommends that the Ocean Discharge Criteria provisions (Sec. 403) be modified to:

1. Specify that permit writers can assume that ocean discharges cause no unreasonable degradation of ocean waters if the discharges comply with NPDES permit effluent limitations and conditions.

2. Specify that a separate Ocean Discharge Criteria Evaluation is not required in an area for which an Environmental Impact Statement or similar analysis has been prepared by the Department of the Interior or a state before a lease sale in the area.

3. Specify that an NPDES permit should not be denied under Section 403 of the Clean Water Act unless EPA determines that the discharge would cause unreasonable degradation of the marine environment.

---

4 "Petroleum Refining Point Source Category Effluent Limitations Guidelines, Pretreatment Standards and New Source Performance Standards." Federal Register, October 15, 1982, Vol. 31, No. 201, p. 46438.

The ocean discharge requirements were originally inserted in the act because Congress was concerned that the technology-based controls mandated by the act would not adequately protect ocean waters. However, these requirements duplicate both the NPDES permit program and other environmental controls under the offshore leasing program that already protect the ocean.

Discharges into the ocean of drilling fluids, produced waters and other minor effluents associated with the exploration and production of oil or gas are regulated under the NPDES permit program of the Clean Water Act. In addition to the NPDES requirements, EPA has interpreted the Ocean Discharge Criteria provisions to require a separate, detailed environmental assessment. Companies must supply "sufficient information" in this assessment for a permit writer to determine that a proposed discharge will not degrade ocean waters.

The Ocean Discharge Criteria requirement duplicates the NPDES permit program and other important environmental controls that already protect the ocean from unreasonable degradation. First, at the time of every offshore lease sale, state and federal laws require a thorough environmental analysis of the area to be leased. For the Outer Continental Shelf, this means the preparation of a comprehensive Environmental Impact Statement. Next, all offshore operations must meet the strict requirements of the NPDES permit program before discharges are authorized. Before offshore drilling operations can begin, the company must prepare and have approved by the Department of the Interior a site-specific plan of exploration and an environmental report. Before production can begin, the company must prepare a production plan and another environmental report. And, for a new producing area, the Department of the Interior must prepare another Environmental Impact Statement.

Experience under the act has shown that the ocean is sufficiently protected by these controls. The petroleum industry has demonstrated through numerous studies and reports that typical effluents from exploration and production operations disperse rapidly and have an insignificant effect on marine ecosystems.

The Ocean Discharge Criteria requirement is, in effect, an additional and duplicative environmental study. The requirement for "sufficient information" is open-ended and subject to EPA's interpretation. EPA has required companies to prepare assessments that approach the length and complexity of an Environmental Impact Statement and that duplicate studies already completed. These additional assessments are required even though the act generally exempts the NPDES permit process from the requirement to prepare an Environmental Impact Statement. The result has been substantial delay and expenses for offshore oil and gas exploration without adding appreciably to existing information or improving water quality.

For example, by early 1983, EPA had issued no general NPDES permits for 14 separate scheduled lease sales in Alaskan waters, despite the agency's announced objective a year and a half before to do so. Beaufort Sea and Norton Basin sales had already been held, and the lessees were attempting to make firm plans and commitments to explore their leases. Without NPDES permits in hand, however, it is generally not prudent to commit to an expensive drilling rig or drilling program.

In short, the ocean discharge requirements in the Clean Water Act are often both expensive and unnecessary. They can block efficient and timely permit issuance, and they do not significantly improve water quality. As a result, exploration and development of OCS resources can be delayed.

C. Best Available Technology Requirements

API recommends that the Clean Water Act's effluent guidelines (Sections 301 and 304) be modified:

1. To designate Best Available Technology (BAT) as equivalent to Best Practicable Technology (BPT) for those industries where BPT is adequately controlling the discharge of toxic pollutants.

2. To allow modifications of BAT requirements in those limited cases where a discharger can demonstrate that the effluent from its facility does not violate water quality standards or adversely impact the receiving waters.

1. Designating BAT Equivalent to BPT. Greater flexibility is needed in assessing BAT requirements for toxic pollutants in order to recognize the substantial achievements industry has made to date and to avoid "treatment for treatment's sake."

The act's current BAT provisions could be interpreted to require the installation of controls more stringent than BPT in all cases, irrespective of cost effectiveness and the substantial achievements in removing toxic pollutants. For many categories and classes of point sources, BPT is effectively removing toxic pollutants present in raw wastewaters of industrial discharges.

For example, analytical data obtained by both EPA and industry on petroleum refineries indicate that only a limited number of toxic pollutants are present in refinery raw wastewaters. In fact, only 11 compounds were found having average concentrations greater than 100 parts-per-billion in the raw wastewaters during an extended study at two refineries in the Orleans area.[5] These [illegible] compounds were either not [illegible] or were present at very low concentrations in the final effluents of the refineries. In most cases, greater than 95 percent removal of individual toxic pollutants was found in this and other studies.

These data clearly confirm this statement from the December 1980 report by the House Subcommittee on Oversight and Review of the Committee on Public Works and Transportation:

"... it is now known that basic biological treatment technologies do in fact remove considerable quantities of the toxic (priority) and other pollutants, and in many instances either reduce or eliminate the threat of both acute and chronic toxicity to the aquatic environment." (emphasis added).[7]

Clearly, the development and installation of more stringent technology for industries where BPT adequately controls toxic pollutants is an unnecessary drain on limited time and resources and benefits neither the economy nor the environment.

2. Allowing Case-by-Case Modifications of BAT Limitations Where Appropriate. The 1977 amendments to the act provided for waivers, based on economic and water quality considerations, for BAT requirements and nonconventional pollutants, but not for toxic pollutants.

However, in limited cases, technology designated as BAT for toxic pollutants may provide significantly more stringent control than is needed to protect receiving waters. Industry-wide BAT limitations fail to recognize that the toxicity of pollutants varies greatly, depending on the characteristics of the pollutant itself and the physical/chemical characteristics of the receiving water. That is, the concentration of a pollutant which will produce a toxic effect on aquatic life in the receiving water varies from stream to stream and from pollutant to pollutant.

Regarding Legislative Amendments to Section 404 of the Clean Water Act

SUMMARY

The American Petroleum Institute, Western Oil and Gas Assocation, Alaska Oil and Gas Association, Mid-Continent Oil and Gas Association, and the Wetlands Energy Production Association appreciate this opportunity to comment on legislative reform to Section 404 of the Clean Water Act. The petroleum industry is active in various types of permitting activities under Section 404 in order to explore and, hopefully, develop vitally needed energy resources. Such activites include constructing drilling pads, access roads and pipelines.

In recent years, the industry has experienced problems and difficulties with the Section 404 permit program that regulates the discharge of dredged or fill material. The program is complex, often uncertain and, frequently, results in unnecessary costs and delays without providing additional environmental protection.

The petroleum industry is concerned with the implementation of the Section 404 permit program and has in the past recommended proposals to improve it. The industry supports the goals of the Clean Water Act and recognizes the Act as an important protection for our nation's waters.

Some progress in streamlining the permit review process while continuing to protect the environment has been achieved through the 1982 revised Memoranda of Agreement between the U.S. Corps of Engineers (Corps) and the Departments of the Interior and Commerce and the Environmental Protection Agency (EPA). However, to ensure continued adherence to the goals of the Act and to increase program efficiency, statutory changes in Section 404 are necessary. Eight recommended legislative revisions are described below.

(1) Centralize administrative authority over the Section 404 program in one federal agency, the U.S. Army Corps of Engineers.

Currently, the EPA develops guidelines, ostensibly in conjunction with the Corps, to specify disposal sites for discharged material; approves state program assumption; vetoes Corps' permit decisions; and brings suit against unpermitted dischargers of dredged or fill material. Dual responsibility by the two agencies over the Section 404 program has caused delays and uncertainties when processing permits. Section 10(a) of H.R. 3282 proposes to elevate EPA's role in this program by ensuring the EPA/Section 404(b)(1) guidelines are given regulatory effect. If enacted, the Corps would be put in the unreasonable position of having to prove that a proposed activity will not have an unacceptable adverse effect on the environment and that agency comments objecting to a permit are unwarranted. Thus, only

20-955 O—84——158

environmental factors could be considered and mere conjecture about environmental harm could trigger lengthy studies and delays. This would eliminate the discretion necessary for the Corps to administer effectively its permit program.

An added concern to industry is the fact that the EPA guidelines are replete with procedural (i.e., non-substantive) requirements. Again, if given statutory effect, EPA could dictate to the Corps how it should implement the Corps' program. To conform to Section 404(b) of the Act, the guidelines should be limited to the establishment of substantive criteria for the specification of disposal sites -- not procedural requirements.

Therefore, the petroleum industry recommends deleting Section 10(a) from H.R. 3282 and adding language to the Act to:

(a) centralize administrative authority in the Corps over the Section 404 program;
(b) ensure that the EPA guidelines are used as guidelines --not inflexible regulations;
(c) limit the EPA guidelines to the establishment of substantive criteria to specify disposal sites; they should not set forth procedural requirements; and
(d) require that permitting authorities document that violation of the guidelines' substantive criteria would occur in order to deny a permit application.

(2) <u>Streamline the permit issuance process to minimize costs and unnecessary delays</u>.

Delays in the permit review process that unnecessarily increase compliance and project costs are one of industry's major concerns. The Corps usually takes from 4 to 15 months to process a permit, although Section 404 gives the Corps 105 days to do so. Frequently delays occur because of the involvement of federal, state and local agencies and private parties.

The 1982 revised Memoranda of Agreement (MOAs) have tried to alleviate this problem. For example, they require justification from parties seeking to extend the comment period. Industry has observed that interagency coordination has been more well defined and better focused upon issues of genuine concern. We are informed that the MOAs have saved one operator between $25-50 million per year without causing an increase in the degradation of the nation's waters. In short, the MOAs are working and the interests of the public and the regulated community are being served well.

Section 10(b) of H.R. 3282 proposes to allow: automatic extensions of agency comment periods without showing any justification; nondiscretionary administrative appeals; and an increase in the number of agency levels that could review a permit decision. If enacted, thus Section 10(b) would abrogate the beneficial effects of the 1982 MOAs. Therefore, industry

urges deletion of Section 10(b) from H.R. 3282 and adding language in the Act to codify the 1982 revised MOAs.

(3) Expand the use of general permits.

Section 404(e) of the Act provides general permits for any category of activities that is similar in nature and will cause only minimal adverse environmental effects. The Corps may consider itself limited in reviewing a permit application by considering only the proposed activity. Individual permits frequently impose conditions and/or stipulations for activities that are of a repetitious nature, such as drilling pads and laying of pipelines. To maintain adequate protection of the nation's waters and yet reduce unnecessary paperwork and permit delays, the petroleum industry recommends amending the Act to expand the use of general permits for both onshore and offshore activities that are similar and adequately conditioned to avoid any significant adverse environmental impacts.

(4) Eliminate dual federal - state review of permit applications.

Before a project may proceed, an operator must often secure federal, state, and local permits and approvals. Multi-tiered review by these agencies occurs in many forms: their programs regulate the same activities, they evaluate similar factors, provide similar opportunities for public participation, and impose the same or similar permit conditions and/or stipulations. This redundant permitting scheme does not enhance environmental protection, but it does add to unnecessary permit costs and delays. Therefore, to reduce such extra costs and delays while continuing to protect the environment, the Act should eliminate dual federal-state review by specifically allowing the Corps to approve without additional review state permits that meet the Corps' requirements.

(5) Require permit conditions to relate only to the permitted activity.

The purpose of imposing conditions and/or stipulations on permits is to reduce or eliminate adverse impacts on the environment by a proposed activity. However, conditions and/or stipulations are often used to regulate activities that are not directly related to the Section 404 permitted activity. This unwarranted conditioning can be eliminated if the Act were amended to require permit conditions and/or stipulations to relate only to the permitted activity -- the discharge of dredged or fill material.

(6) Require a demonstration of the need for permit conditions by commenting agencies.

Under the current administration of the Section 404 program, the applicant must prove that no significant harm to the nation's waters will occur during operations without his applying extra

protective permit conditions. To avoid additional costs and delays associated with challenging these conditions, the applicant often accepts unsubstantiated permit conditions. However, unsubstantiated conditions frequently result in unnecessary extra costs. To prevent this situation, the Act should be amended to require reviewing agencies to demonstrate to the Corps the need for their requesting permit conditions.

(7) Substantially reduce the geographic scope of the Section 404 permit program.

Prior to 1975, the Corps regulated activities in navigable waters. In 1975, the District Court for the District of Columbia ruled that "navigable waters" under the Clean Water Act, including Section 404, were to extend to the furthest limits of constitutional power. As a result, the Corps regulates activities not only in traditionally navigable waters but also in land areas that may not be waters at all, such as intermittent streams, sandflats, and in some cases, merely damp ground.

Overly expansive federal programs, such as the Section 404 program, cause unwarranted federal regulation and needless imposition of uncertainty and delay upon the regulated community. This results in unnecessary added costs to industry and federal government.

In addition, the Act states a policy "to recognize, preserve and protect the responsibilities and rights of States ...to plan the development and use...of land and water resources." It is also the policy of the Act that the states regulate dredging and filling activities within their borders. Under the current scheme, the Corps regulates dredge and fill operations, makes land use decisions and significantly affects land use planning.

Industry recommends that the Act be amended to substantially reduce the geographic scope of Section 404. By so doing, this permit program would better conform to the stated policies of the Clean Water Act and would reduce unnecessary federal regulation.

(8) Balance national energy and other natural resource needs with environmental considerations when deciding permits.

Permit review policies of the Corps and EPA emphasize protection of the environment to the exclusion of other important, national interests, such as energy self-sufficiency and food and fiber. To ensure a proper balancing of all relevant factors in permit decision-making, the Act should be amended. Consideration of important national needs and values, including energy development, should be statutorily required during permit review.

In summary, we urge that necessary legislative changes described above be enacted to eliminate those problem areas and points of imbalance that Congress can best remedy. A meaningful and responsive program can then be established that will not only improve the Section 404 program but will also protect our nation's waters.

Regarding Legislative Amendments to Section 404 of the Clean Water Act

The American Petroleum Institute (API), the Western, Alaska, Mid-Continent Oil and Gas Associations, and the Wetlands Energy Production Association wish to thank the House Subcommittee on Water Resources for this opportunity to comment on Section 404 of the Clean Water Act. These associations represent all segments of the petroleum industry who explore (and hopefully discover and produce hydrocarbons) in a wide variety of terrains and climatic conditions onshore and offshore. In order to engage in these activities, which are so vital to our nation's goal of reducing our dependence of foreign oil, we must secure both mineral leases and access rights from the owners of the land over which we must travel, explore, and operate. In addition, we must obtain necessary federal, state and local permits and comply with their respective requirements. If our activities will occur in the waters subject to Section 404 of the Clean Water Act, we invariably must secure a permit for the disposal of dredged or fill material which is issued by the U.S. Army Corps of Engineers ("Corps").

Administration of the Section 404 permit program to regulate the discharge of dredged or fill material is complex and often uncertain. The permit decision-making process frequently results in unnecessary costs and delays without providing additional environmental protection. The problem is not permit denial; it is permit delay. For example, oil industry experience indicates that, on average, it takes approximately four months to receive Section 404 permits. A predictable permitting process that eliminates costly reviews and delays is necessary.

The petroleum industry has been concerned with the conduct of this program for several years. API has recommended several regulatory and legislative proposals to improve it. Some progress is being made in the wake of the 1982 revisions to the Interagency Memoranda of Agreement (MOAs) and recent regulatory proposals. We are informed that the revised MOAs have saved between $25-50 million per year for just one operator. Significantly, this has occurred with no increased degradation of the nation's waters.

Industry supports the goals of the Clean Water Act and recognizes the Act as an important protection for our nation's waters. To ensure increased program efficiency and continued adherence to these goals, statutory changes in Section 404 are necessary. Such desired revisions include changes to:

(1) Centralize administrative authority over the Section 404 program in one federal agency, the U.S. Army Corps of Engineers;

(2) Streamline the permit issuance process to minimize costs and unnecessary delays;

(3) Expand the use of general permits;

(4) Eliminate dual federal-state review of permit applications;

(5) Require that permit conditions relate only to the permitted discharge activity;

(6) Require a demonstration of the need for permit conditions by commenting agencies;

(7) Substantially reduce the geographic scope of the Section 404 permit program.

(8) Balance national energy and other natural resource needs with environmental considerations when deciding permits; and

Each of these points will be discussed in detail below.

(1) Centralize administrative authority in one federal agency - the U. S. Army Corps of Engineers

Authority for implementing the Section 404 program is divided between two agencies, the U.S. Army Corps of Engineers and the Environmental Protection Agency. The Corps administers the Section 404 program, including making permit denial and approval decisions. The EPA develops guidelines, ostensibly in conjunction with the Corps, to specify disposal sites for discharged material. The EPA also has veto authority to override a Corps' permit decision (Section 404 (c)). Dual responsibility by the two agencies over the Section 404 program has caused delays and uncertainties when processing permit applications because of presumptions in the EPA guidelines not required by the statute. As a means to expedite permit processing, the principal administrative agency, the Corps, should be the final authority for determining and implementing the Section 404 program.

Section 10(a) of H.R. 3282 proposes to elevate EPA's role in this program by ensuring that the Section 404(b)(1) guidelines are given regulatory effect. For example, if this provision were enacted, the Corps would be put in the unreasonable position of having to prove that every proposed activity would not cause adverse effects, a negative burden of proof. Moreover, only environmental factors may be considered, even though other

factors may be relevant to the proposed activity and may benefically outweigh any possible adverse environmental effects. Thus, Section 10(a) of H.R. 3282 could eliminate the discretion the Corps must have to administer effectively its permit program.

Under the current EPA guidelines, an applicant must show that his discharge, if permitted, will not cause any unacceptable adverse environmental impacts. Federal agencies and the public are given an opportunity to comment on the application and the anticipated environmental impacts. The Corps then decides whether to grant, conditionally grant, or deny the permit. Under the proposed legislation, the Corps' analysis would be focused upon making a discrete, factual determination that the proposed discharge will not have any adverse environmental impacts.

The proving of a negative has been seen in other contexts as creating an unnecessary hurdle to prompt agency decision-making. This hurdle is the extra step of data gathering and collecting additional information. For example, under Section 403 (ocean discharge criteria), if insufficient information exists to make the necessary determination, no permit may be issued. As under Section 403, Section 10(a) of H.R. 3282 would undoubtedly necessitate data gathering and studies to prove that no conceivable environmental harm could possibly occur (a negative burden of proof). In short, this imposition of a statutory burden of proof to prove a negative would result in the preparation of unnecessary, time consuming and expensive new studies based upon mere conjecture about possible environmental harm. Lengthy permit delays would inevitably result without affording any greater environmental protection to the nation's waters.

Even after having required these new studies and delaying the issuance of needed permits, the Corps' permit decision would still be susceptible to ready challenge by those opposed to any development that requires a Section 404 permit, regardless of how environmentally benign it may be. Such challenge may develop through statutory citizen suit provisions. In such cases, the plaintiffs could easily allege that the Corps inadequately determined, based upon the record then developed, that the proposed activity would not harm the nation's waters.

An added issue of concern to industry involves the fact that the current EPA guidelines are replete with numerous procedural requirements. This has enabled EPA to dictate to the Corps how to implement the Corps' program. In consonance with the language of Section 404(b), the guidelines should be limited to the establishment of substantive criteria for the specification of disposal sites -- not procedural requirements.

If enacted, Section 10(a) of H.R. 3282 would ensure that EPA would retain and possibly expand upon the onerous procedural

requirements already found in its guidelines. In addition to the practical difficulties in effectively administering the program under guidelines that have intrusive procedural requirement, these guidelines encourage litigation based on alledged failures to comply with procedural requirements. To avoid this and in keeping with Congressional intent, the Act should be amended to specify more clearly the role guidelines are intended to play in the permit process: the establishment of substantive criteria for the specification of disposal sites.

API and other petroleum industry associations, therefore, recommend deleting Section 10(a) from H.R. 3282. We also recommend that language be included in the Clean Water Act to: (1) ensure that the Section 404(b)(1) guidelines are used as guidelines -- not binding regulations; and (2) require that permitting authorities establish a violation of the guidelines' substantive criteria in order to deny a permit application. To ease the burden on the permitting authority, a relatively low threshold of proof could be imposed. For example, the permitting authority might only have to establish some evidence that a violation would occur if the applicant conducts the discharge activity as proposed. Or, the permitting authority could be required to demonstrate that a violation might occur. In either case, the applicant would then have the opportunity to rebut this showing in order to secure a permit. An approach such as this would have the practical effect of more equitably assigning who has what burden of proof, while at the same time adequately protecting environmental values appropriate for consideration under Section 404.

(2) Streamline the permit issuance process to minimize costs and unnecessary delays

Delays in the permit process which unnecessarily increase compliance and project costs are one of industry's major concerns. Although Section 404 gives the Corps 105 days to act on a permit application, it usually takes from 4 to 15 months or more to decide whether or not to issue a permit. Frequently, the delays occur because of the involvement of federal, state and local agencies and private parties who generally oppose activities on lands subject to Section 404 permitting.

The 1982 Memoranda of Agreement (MOAs) between the Corps and the Departments of the Interior and Commerce and the EPA have tried to alleviate this problem. The MOAs require that: (1) requests for extensions to the comment period be justified by a showing of need; (2) extensions are not to exceed 30 days; and (3) discretionary review of permit applications be limited to one agency level.

For over the year that the MOAs have been in effect, API has observed that interagency coordination has been more well defined

and better focused upon issues of genuine concern. In addition, the MOAs generally have speeded up the permit review process while continuing to provide protection for the nation's waters. In short, the MOAs are working and the interests of the public and the regulated community have been well served by these revised MOAs.

Therefore, the petroleum industry recommends that this important reform effort be given the permanance of a legislative mandate. Unfortunately, Section 10(b) of H.R. 3282 proposes to abrogate the beneficial effects of the MOAs. Section 10(b) would: (1) allow automatic extensions of agency comment periods without any showing of justification; (2) reinstitute nondiscretionary administrative appeals; and (3) increase the number of agency levels which would review a permit decision. The Corps would also have to document its reasons for failing to follow the recommendations made by commenting agencies. All of this adds up to additional delays without any added environmental protection. Consequently, Section 10(b) of H.R. 3282 should be deleted and Section 404(q) should be amended to codify the current MOAs which have effectively streamlined the permit process.

(3) Expand the use of general permits

The use of general permits, on a regional and nationwide basis, can be an efficient and practicable means to reduce unnecessary delays, costs, and paperwork. Indeed, it was the avoidance of these problems that gave rise to the enactment of Section 404(e). 4 A Legislative History of the Clean Water Act (Serial No. 95-14) at 708 and 713. Although numerous general permits have been issued under this section, the need for more general permits is clear. Therefore, express authorization for the expanded use of general permits should be incorporated into the Act.

General permits expressly provided for in the Act (Sec. 404(e)) may cover any category of activities that is similar in nature and that will cause only minimal adverse environmental effects. In deciding whether a category of activities is appropriately subject to a general permit, the Corps may consider itself limited by Section 404(e) to considering just the proposed activity. In fact, conditions and/or stipulations are attached to many repetitious to activities to ensure that such activities will not cause undue environmental harm. Examples of such repetitious activities in the petroleum industry that often receive similar permit conditions and/or stipulations are the construction of drilling pads and the laying of pipelines.

The Act should be amended to provide greater flexibility in the use of general permits, particularly for activities that are of repetitious nature. In this vein, the Act should expressly recognize that when the Corps determines that an activity is

appropriately subject to a general permit, it may consider not only the proposed activity but also available protective conditions and/or stipulations. By so doing, the Act would provide for greater general permitting that will adequately control environmental effects and address the need to reduce red tape, unnecessary paperwork and permit processing delays.

(4) Eliminate dual federal-state review of permit applications

Before a project may proceed, an operator must often secure federal, state, and local permits and approvals. Multi-tiered review by these agencies occur in many forms: their programs regulate the same activities; they evaluate similar considerations; they provide similar opportunities for public participation; and they impose the same or similar permit conditions and limitations. This redundant permitting scheme does not enhance environmental protection, but it does add to unnecessary permit and project delays and costs. Therefore, industry recommends that the Act address this issue of dual federal-state review of 404 permit applications.

Although state assumption of the Section 404 program under Section 404(g)-(1) could resolve this problem, the fact remains that no state has even applied for this authority. The reasons for this are many and varied (e.g., budgetary constraints, complexity of assumption requirements, etc.). A compromise solution between total state delegation (which has proven to be unacceptable to the states) and dual federal-state review (which is cumbersome, costly, time consuming and unnecessary) would be to expressly authorize the Corps to accept and adopt, without additional federal review, state permits that meet Corps' requirements.

The Corps has attempted to implement just such a program under its existing legislative authority. This effort, however, is currently the subject of pending litigation. Legislative attention to this issue at this time would ensure the continued vitality of this much needed tool for enhancing administrative efficiency while also adequately protecting physical and biological integrity of our nation's waters.

(5) Require that permit conditions relate only to the permitted discharge activity

The purpose of imposing conditions and/or stipulations on permits is to reduce or eliminate any adverse impact on the environment by a proposed activity. With respect to Section 404 permits, conditions and/or stipulations should be imposed that relate directly to the permitted activity, that is the discharge of dredged or fill material. In practice, however, conditions and

stipulations have been frequently used to regulate activities that are not directly related to the discharge of dredged or fill material. Such activites may occur after the permitted discharge is completed. For example, one member company's Section 404 permit included a condition that required the Corps of Engineers to approve production from a well that was to be drilled after the Section 404 permitted activity was completed.

In addition, a 1982 General Accounting Office report by the Comptroller General to the Congress of the United States 1/ concluded that permit conditions have often been imposed that do not relate directly to the proposed discharge site. GAO noted that some of these requirements are extremly costly and "the effectiveness of these measures has not been ascertained." 2/

industry, therefore, urges Congress to amend Section 404 by requiring that all permit conditions and/or stipulations must relate directly to the permitted activity, the discharge of dredged or fill material.

(6) Require a demonstration of the need for permit conditions by commenting agencies

A related concern is the frequent lack of justification of permit conditions and/or stipulations requested by commenting agencies and other interested parties. Unjustified conditions or stipulations are those that lack any scientific or site specific evidence that environmental harm will occur if such conditions are not followed. The 1982 GAO report, supra, observed that most Section 404 permits in Alaska include some sort of stipulation. Of those, 40 percent lacked any site specific support for their need.

Under the current administration of the Section 404 program, the applicant must prove that no significant harm to the nation's waters will occur during operations without his applying extra protective permit conditions. To avoid additional costs and delays associated with challenging these conditions, the applicant often accepts unsubstantiated permit conditions. This practice, however, inevitably results in additional and unnecessary costs.

1/ Developing Alaska's Energy Resources: Actions Needed to Stimulate Research and Improve Wetlands Permit Processing (GAO/EMD-82-44, June 17, 1982).

2/ Id, p. 34.

In light of the above reasons, industry recommends that the Act require permit reviewing agencies to justify, in writing, to the Corps and to the applicant the need for requested permit conditions or stipulations.

(7) Substantially reduce the geographic scope of the Section 404 permit program

Section 404(a) requires that a permit be secured from the Corps before any dredged or fill material is discharged into "navigable waters". In 1975 the District Court for the District of Columbia interpreted Section 404's legislative history as intending "navigable waters" to extend to the furthest limits of constitutional power. As a consequence, the Corps regulates not only activities in traditionally navigable waters, but also activities in land areas that may not be waters at all (e.g., intermittent streams, sandflats, normally dry river bottoms and, in some cases, merely damp ground). In Alaska, the Corps' jurisdiction has been asserted over an estimated 57% of the state, including the North Slope and coastal areas vital to energy development. To bring this extensive regulatory program in line with stated purposes of the Clean Water Act and to provide greater certainty as to that which properly should be regulated, a definition of "navigable waters" specifically applicable to Section 404 is needed.

Overly expansive federal programs result in: unwarranted federal regulation; the dissipation of scarce federal manpower, money and other resources; and, the needless imposition of uncertainty and delay upon the regulated community resulting in unnecessary added costs to industry and increased federal regulatory expenses. All of these extra costs are ultimately passed on to the consumer and the taxpayer.

In addressing this issue the Congress should be congnizant of the fact that wherever wetland regulation exists, land use restrictions are imposed. The inherently localized state prerogative to make land use decisons and to engage in land use planning has been sacrificed under the current, overly expansive interpretation of the proper scope of the Corps' permitting program. What is more, this has occurred despite the stated policy of the Act and the Congress "to recognize, preserve and protect the responsibilities and rights of States...to plan the development and use (including restoration, preservation and enhancement) of land and water resources." (emphasis added; Section 101(b)). It is also the policy of the Act that the states regulate dredging and filling activites that occur within their borders. Under the current scheme, the Corps regulates dredge and fill operations, makes land used decisions and

significantly affects land use planning. This imbalance should be corrected if the announced policies of the Act are to be faithfully adhered to.

To reduce unnecessary federal regulation, to add certainty to the Section 404 program, and to ensure Section 404 conformity to the Act's stated policies, the Act should be amended to better define "navigable waters" and reduce the geographic scope of the Section 404 program.

(8) Balance national energy and other natural resource needs with environmental considerations when deciding permits

Another major issue is the balancing of factors to be considered during the permit decision-making process. The administrative policies of the Corps and EPA, particularly under the Section 404(b)(1) guidelines, emphasize protection of the environment to the exclusion of other important, national goals and priorities (e.g, energy self-sufficiency, food, fiber, housing, mineral and other essential natural resource needs). Many geographical areas that come under the jurisdiction of Section 404 have enormous energy value to the nation. Currently, these other important factors can be considered only after the permit application has satisifed the rigors of the environmental protections under the EPA guidelines.

To ensure a proper balancing of factors when deciding whether or not to issue permit, legislation is necessary. A balanced consideration of all relevant factors in permit decision-making should be added to Section 404(b). Consideraton of important national interests and values would then become a statutorily required part of the Corps' permit decison-making process.

We urge that necessary legislative changes described in this statement be enacted to eliminate those problem areas and points of imbalance that Congress can best remedy. A meaningful and responsive program can then be established that will not only improve the system but will also protect our nation's waters.

Mr. ROE. Please proceed.

TESTIMONY OF KENNETH E. BLOWER, MANAGER OF ENVIRONMENTAL AFFAIRS, STANDARD OIL OF OHIO, AND WILLIAM MANNING, SAFETY AND ENVIRONMENTAL AFFAIRS MANAGER, LOUISIANA LAND & EXPLORATION CO., ON BEHALF OF THE AMERICAN PETROLEUM INSTITUTE

Mr. BLOWER. Mr. Chairman, members of the subcommittee, I am Kenneth E. Blower, manager of environmental affairs for the Standard Oil Co. of Ohio. Today I am representing the American Petroleum Institute as chairman of API's water programs committee. We have submitted a written statement that I would ask be included in the official record.

Mr. ROE. No objection. So ordered.

Mr. BLOWER. API supports the House and Senate efforts to insure the Clean Water Act's workability. Provisions to extend compliance deadlines and to make the national pollutant discharge elimination system permit program more manageable move in this direction. We do, however, suggest some modifications to these provisions that I will discuss in a moment.

I would like to talk first about proposed amendments dealing with water quality standards and the control of toxics after best available technology is achieved. API is concerned that these proposed amendments will create more problems than they will solve.

Both the House and Senate bills have sections that would define just how the States designate the use of water bodies and how they insure the protection of high-quality waters. These provisions should be deleted because EPA has recently changed its proposed regulations which prompted these amendments. Senators Stafford, Chafee, Randolph, and Mitchell have told Mr. Ruckelshaus that they support EPA's revised approach. In fact, they intend to offer an amendment to remove from S. 431 the language related to these provisions when the act is debated on the floor of the Senate. Codifying these complex regulations would not insure their effectiveness. It would instead reduce the flexibility needed to make them workable.

We would urge that the House also delete this section from their bill.

Both bills also require States to adopt numerical criteria for toxic pollutants. The Association of State and Interstate Water Pollution Control Administrators has questioned this approach. They point out that the list of pollutants would expand indefinitely and that an unworkable monitoring program would be required.

API believes that a statutory provision on this issue is premature. EPA and the scientific and technical community are still grappling with the proper role of biological versus numerical criteria for protection of aquatic life. Congress would be unwise to arbitrarily preempt current efforts to resolve this issue.

The provisions in both bills that would mandate additional controls for toxic pollutants after BAT has been achieved are particularly disturbing to us. These proposed amendments would be ineffective for these reasons. First, the amendments set up an unrealistic and rigid timetable for identifying impaired waters and for es-

tablishing additional controls for industrial and municipal dischargers. Second, the proposals do not address the considerable pollution caused by nonpoint sources. Finally, the House proposal would preempt State authority to develop water-quality-based effluent limitations—even though the States, with guidance from EPA, are better equipped to make these decisions.

In short, a new statutory provision is not needed to insure that the problem of toxic pollutants is addressed. In fact, under the authority already provided in the Clean Water Act, the States and EPA are working to create an effective approach to control these pollutants. Those efforts are more likely to solve any problems than a hasty and rigid statutory provision.

On the issues of compliance deadlines and the manageability of the NPDES permit program, API does believe that the Clean Water Act should be amended.

Although we agree that compliance deadlines need to be extended, we do not support the fixed deadlines in the House and Senate bills. Experience has shown that fixed dates do not provide an effective approach—the result too often is the need for another extension of the deadline. API believes that compliance with best available technology and best conventional technology should be required 36 months from the date guidelines are established.

Under the NPDES permit program, EPA and the States are now required to issue permits for sources which are insignificant contributors to water pollution and to renew permits too frequently. The Senate bill S. 431 has addressed these problems. One provision would exclude certain categories of storm water runoff from the permit program. We favor this approach and urge similar action in the House.

A second provision would extend the maximum lifetime of permits to 10 years. We agree that this extension is needed, but the stipulation in S. 431 would require permits to be reopened so frequently that EPA and the States would be swamped with constantly modifying permits and industry would lose any certainty of the duration of permit requirements. We suggest specific language on this point in our written statement.

I would also like to discuss three aspects of the Clean Water Act that have not been addressed in either the House or Senate bill: The treatment of new sources, application of ocean discharge criteria, and best available technology requirements.

With regard to new sources, API believes that the definition of a new source should be based on the date an applicable new source performance standard is promulgated rather than the date it is proposed. Also, discharge permits for new sources should be exempt from review under the National Environmental Policy Act as are new sources under other statutes such as the Clean Air Act and the Resource Conservation and Recovery Act.

An amendment to the ocean discharge criteria section is also needed because these requirements duplicate other environmental assessments. Briefly, these are the assessments now required for oil and gas drilling on the Outer Continental Shelf—an environmental impact statement assessing the environmental effects of the proposed activity; an NPDES permit which imposes technology-based treatment requirements; a site-specific plan of exploration and an

environmental report; a production plan and another environmental report; and, for a new producing area, another environmental impact statement.

The ocean discharge requirement is an additional and redundant environmental review that results in unwarranted costs and unnecessarily delays the search for oil and gas.

Turning to BAT, to avoid treatment for treatment's sake, some modification of the act's best available technology requirements is warranted. When BPT adequately controls the discharge of toxic pollutants, and further control is not cost-effective, BAT should be designated as equivalent to BPT. And in those limited cases where a discharger can demonstrate that the effluent from its facility does not adversely impact the receiving water, modification of BAT requirements more stringent than BPT should be allowed.

In summary, we are all concerned that any changes in the Clean Water Act increase its effectiveness and we support approaches that will do that. However, in the case of water quality standards and control of toxic pollutants, rigid statutory solutions will not. We urge Congress to consider this observation on the toxics control program made in a 1980 House committee report on the implementation of the Clean Water Act:

> The history of this program shows that the asking-for-everything-at-once approach has produced enough confusion and inefficiency to have all too often slowed, rather than accelerated, the achievement of our goals.

To present API's views on amendments to section 404 of the Clean Water Act, I would like now to introduce William Manning, safety and environmental affairs manager of the Louisiana Land & Exploration Co.

Mr. ROE. Mr. Manning.

Mr. MANNING. Thank you.

Mr. Chairman and members of the committee, I, too, would like to express my thanks and appreciation for this opportunity to present the petroleum industry's views on section 404 of the Clean Water Act. In addition to API, I am speaking on behalf of the Western, Alaska, and Mid-Continent Oil and Gas Associations and the Wetlands Energy Production Association.

We support the goals of the Clean Water Act and recognize the act as an important protection for our Nation's waters. However, there are areas of concern regarding section 404 of the act that I would like to discuss. Because time is limited, I will summarize the key problem areas. We have submitting written comments which discuss in detail our concerns with section 404 and proposed legislation.

First, sections 10 (a) and (b) of H.R. 3282 propose to amend section 404 of the act. If enacted, these provisions would compound the existing complexities and uncertainties in the section 404 permit program.

Section 10(a), in effect, converts the EPA/section 404(b)(1) guidelines into regulations. This provision also adds a new clause to section 404(b)(1) which would place the Corps of Engineers in the unreasonable position of having to prove a negative—that the proposed activity would not cause adverse environmental effects. Section 10(b) of H.R. 3282 would allow: automatic extensions of agency

comment periods without showing any justification; nondiscretionary administrative appeals; and an increase in the number of agency levels that could review a permit decision.

Together, these sections would eliminate the discretion the corps must have to administer effectively its permit program and would lengthen the permit review process without adding any greater environmental protection. For these reasons, the petroleum industry strongly urges deletion of sections 10 (a) and (b) from H.R. 3282.

In addition, we have several problems with section 404. We recommend the following legislative changes be made:

Administrative authority over the section 404 program should be centralized in one Federal agency—the Corps of Engineers.

The permit issuance process should be streamlined to minimize unnecessary costs and delays.

The use of general permits for both onshore and offshore activities that are similar and adequately conditioned to avoid any significant adverse environmental impacts should be expanded.

Dual Federal-State review of permit applications should be eliminated by specifically allowing the corps to approve without additional review State permits that meet corps' requirements.

Permit conditions and stipulations should be required to relate only to the permitted activity; that is, the discharge of dredged or fill material.

Reviewing agencies should be required to demonstrate to the corps the need for requested permit stipulations.

The geographic scope of the section 404 permit program should be substantially reduced.

Consideration of important national interests and values, including the Nation's need for energy, should be required throughout the decisionmaking process.

Because time does not permit discussion of all of our recommendations, I would like to discuss briefly one of them; that is, elimination of multiple Federal-State review of permit applications. Before a project may proceed, an operator must often secure Federal, State, and local permits and approvals. Multitiered review by these agencies occurs in many forms and they frequently vary from State to State. Their programs regulate the same activities; they evaluate similar considerations; provide similar opportunities for public participation; and impose the same or similar permit conditions and limitations. This redundant permitting scheme does not enhance environmental protection, but it does add to unnecessary permit and project delays and costs.

Although State assumption of the section 404 program could resolve this problem, the fact is no State, to my knowledge, has even applied for this authority. A compromise solution between total State assumption and dual Federal-State review would be to expressly authorize the corps to accept and adopt, without additional Federal review, State permits that meet corps' requirements. Legislative attention to this issue could enhance administrative efficiency while also adequately protecting the chemical, physical, and biological integrity of our Nation's waters.

Again, I thank you for the opportunity to express industry's views on improving section 404, and I would be happy to answer any questions you may have.

Mr. ROE. I thank you both for your comprehensive testimony.

Mr. Stangeland.

Mr. STANGELAND. Mr. Blower, in discussing proposed amendments, you declare in your statement that EPA and the scientific community are still grappling with the proper role of biological versus numerical criteria. Would you expand on that statement and what are the advantages and disadvantages in your opinion of biological versus numerical.

Mr. BLOWER. I think that we are unsure of just where biological criteria fit into the whole scheme of things. When you think of controlling a large number of toxic pollutants, and I think we are moving in this direction in the water program, the numbers may be up to 10, 20, or 30 and the techniques for analyzing these individual parameters are very expensive and very time consuming. Research efforts at the American Petroleum Institute, and research efforts at EPA, are looking at biological techniques as a surrogate measure of toxicity. If that were the case, one would not have to measure individual pollutants but one could measure the effects of the water discharge on certain biological organisms.

What we don't know is how effective that will be, whether it will be beneficial, whether it will reduce costs of analytical testing, whether it can be relied upon, and how it will be incorporated in a permit. This is a slowly maturing program and I would say at the infant stages. There may be benefits from the approach. We don't know. I am aware that in one of Standard Oil's facilities in Ohio that both approaches are being tried and on experimental basis and I think it is just too early to know whether there are benefits there.

Mr. STANGELAND. I have some other questions, Mr. Chairman, but I would ask permission to submit them in writing.

Mr. ROE. No objection. The gentleman will submit some additional questions to you in writing.

Mr. BLOWER. Please do.

[The questions submitted to Mr. Blower follow. Responses to the questions had not been received by the subcommittee at time of publishing.]

QUESTIONS FOR AMERICAN PETROLEUM INSTITUTE

1. MR. BLOWER, ON PAGE 4 OF YOUR ORAL STATEMENT, YOU INDICATE THAT THAT NPDES 10-YEAR PERMIT PROVISION OF S. 431 COULD ALLOW FEW, IF ANY, PERMITS TO BE EXTENDED TO 10 YEARS. WOULD YOU EXPLAIN IN MORE DETAIL WHAT IT IS ABOUT THE SENATE'S LANGUAGE THAT YOU BELIEVE WOULD PRODUCE THIS RESULT?

2. MR. BLOWER, ON PAGE 4 OF YOUR ORAL TESTIMONY, YOU STATE THAT "AN AMENDMENT TO THE OCEAN DISCHARGE CRITERIA SECTION IS ALSO NEEDED BECAUSE THESE REQUIREMENTS DUPLICATE OTHER ENVIRONMENTAL ASSESSMENTS." YOU THEN LIST A NUMBER OF THE OTHER ASSESSMENTS TO WHICH YOU REFER. DO YOU BELIEVE THAT THE REQUIREMENTS OF SECTION 403 OF THE ACT ARE TOTALLY DUPLICATED BY OTHER ENVIRONMENTAL STATUTES? OR ARE YOU SAYING THAT SECTION 403'S REQUIREMENTS ARE SUBSTANTIALLY DUPLICATED?

3. MR. MANNING, YOUR TESTIMONY PRESENTS THE PETROLEUM INDUSTRY'S STRONG FEELINGS THAT SECTIONS 10(A) AND 10(B) OF H.R. 3282, BOTH DEALING WITH AMENDMENTS TO SECTION 404 OF THE CLEAN WATER ACT, SHOULD NOT BECOME LAW. WHAT SPECIFIC CONSEQUENCES WOULD YOU ENVISION IF THOSE PROVISIONS WERE TO BE ENACTED? CAN YOU GIVE ANY EXAMPLES OF HOW YOUR INDUSTRY WOULD BE DIRECTLY AND ADVERSELY AFFECTED BY THESE PROVISIONS?

4. MR. MANNING, YESTERDAY A NUMBER OF WITNESSES TESTIFIED, BASED ON AN ANALYSIS OF THE NUMBER OF 404 PERMITS ISSUED AND THE

LENGTH OF TIME TYPICALLY REQUIRED, THAT THE CURRENT 404 PROGRAM HAS NOT BEEN OVERLY TIME CONSUMING. THEY BELIEVE THAT, IF ANYTHING, PERHAPS MORE TIME SHOULD BE TAKEN BEFORE PERMIT DECISIONS ARE REACHED IN A NUMBER OF CASES. I WOULD EXPECT THAT YOU WOULD NOT AGREE WITH THIS STATEMENT. HAVE YOU DONE ANY PROGRAM ANALYSIS TO SUPPORT THE POSITIONS YOU ARE ADVOCATING TO EXPEDITE THE 404 PROCESS?

5. MR. MANNING, ON PAGE 2 OF YOUR WRITTEN TESTIMONY, YOU STATE THAT "WE ARE INFORMED THAT THE MOA'S HAVE SAVED ONE OPERATOR BETWEEN $25-50 MILLION PER YEAR WITHOUT CAUSING AN INCREASE IN THE DEGRADATION OF THE NATION'S WATERS." COULD YOU PLEASE DESCRIBE THIS SITUATION MORE FULLY FOR THE COMMITTEE?

Mr. ROE. I have no further questions.

Thank you very much for being with us today. I think you stated your case clearly.

Mr. MANNING. Thank you.

Mr. ROE. Our next witness will be Mr. William W. West, the director of environmental control, Republic Steel Corp., and chairman of the AISI Committee on Environment.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF WILLIAM L. WEST, DIRECTOR OF ENVIRONMENTAL CONTROL, REPUBLIC STEEL CORP.

Mr. Chairman, Members of the Subcommittee,

I am William L. West, Director of Environmental Control for Republic Steel Corporation. I am appearing here today on behalf of the American Iron and Steel Institute, the principal trade association for the American steel industry, whose 60 domestic member companies represent 86% of the steel production capacity in the United States. I am Chairman of AISI's Committee on Environment. We are most appreciative of this opportunity to appear today.

On August 2, 1983, I appeared before this Subcommittee to present the viewpoints of AISI on amending the Clean Water Act. At that time, I discussed the background of the steel industry and of our concern with the Clean Water Act. I will not repeat that testimony today, other than to state again that the steel industry has already invested over $2 billion in facilities for control of water pollution, that we have in place facilities to control over 95% of all water pollutants generated in our plants, and that we will be installing within the next few years additional facilities to comply with the BAT effluent limitations guidelines and achieve about 99% control of all pollutants. The steel industry has today such major problems that the Administration has recently established a Steel Advisory Committee to examine the problems that affect our industry.

When I testified previously, I stressed our industry's urgent need for extending the deadlines under the Clean Water

Act, particularly the July 1, 1984 deadline in the Act for compliance with technology based requirements. We still believe that it is essential that the Clean Water Act be amended to extend the deadline for these technology based requirements by a period of 42 months after the date of enactment or 36 months after the imposition of specific limits for industrial operations, whichever is later.

Today, I would like to concentrate on two other very important issues: (1) the pretreatment program, and (2) water quality standards.

It has long been recognized that the joint treatment of industrial and municipal wastes can in many cases provide an extremely cost effective method of eliminating pollution and achieving water quality goals. Municipal sewage treatment plants are designed to, and by their very nature must, effectively remove many pollutants which occur in industrial discharges. For those pollutants only partially removed in municipal sewage works, proper pretreatment by industrial operators, combined with the treatment provided in municipal sewage treatment plants, can result in a protection of water quality with optimum utilization of funds. The Congress clearly recognized the advantages of this joint treatment in establishing the pretreatment program provisions in the Clean Water Act.

EPA has established a pretreatment program attempting to implement the provisions of the present Clean Water Act.

Industry believed that many of the provisions of these regulations were unreasonable and challenged them in court. The recent decision by the U.S. Court of Appeals for the Third Circuit (National Association of Metal Finishers, et al. v. Environmental Protection Agency, No. 78-2256, September 20, 1983) has essentially affirmed the definition of regulations under the present Act. It is now clear that there are three problems which make the present program so unworkable that the Act should be amended. These problems are the issue of removal credits, the deadlines established in the law, and the moving target problem. The problems of deadlines and removal credits are inextricably bound together and today put industry in a real dilemma.

As to the deadline problem, I can cite the experience of my own company which has several facilities that discharge to POTWs. Two facilities are covered by the categorical pretreatment standards of the iron and steel effluent guidelines, while six fall under the integrated electroplating/metal finishing regulations. The compliance date for those under iron and steel regulations is July 10, 1985, while the first deadline for the integrated electroplating/metal finishing category is June 30, 1984. Republic filed the EPA mandated "baseline reports" for all eight facilities by the April 6, 1983 deadline. As of November 1, 1983, Republic has received no response from EPA, nor from state agencies, nor from the local POTWs as to the completeness of our proposed plan of

action. As a result, Republic Steel is proceeding to comply with each of the above deadlines, assuming that the baseline reports are acceptable. Since the EPA rulemaking of January 28, 1981 on removal credits had been deemed unworkable by many local POTWs, EPA proposed revised removal credit provisions on September 28, 1982. Republic relied upon that September 28, 1982 document in preparation of the above mentioned baseline reports. EPA has now stated that they will promulgate new removal credit provisions in early 1984. Should these final provisions be substantially different from the September 1982 proposal, Republic would need to amend the baseline reports and can do so within the 180-day mandate. Clearly, the compliance deadline of June 30, 1984 for six of Republic's eight facilities will have passed within this timeframe. It is very doubtful that such a schedule would allow compliance by July 10, 1985 for at least one of the two iron and steelmaking facilities. Industrial dischargers should not be precluded from the credits provided by Congress in the Act simply because the administrative procedures for implementing the program have not been developed in a timely fashion.

This problem can be illustrated in detail by the following examples from several steel companies.

1. Republic Steel Corporation, Chicago, Illinois Iron and Steelmaking Facilities

Along with other wastewaters, partially treated coke

plant wastewater is discharged to the Chicago Metropolitan Sanitary District (MSD) system. Republic's pretreatment system is currently not meeting the categorical pretreatment standards for ammonia and phenol. If the Chicago MSD receives the authority from EPA, they can grant substantial removal credits for phenol and ammonia. Present removal rates for phenol indicate that on the average 99% of the phenol and some percentage of the ammonia received at the MSD plant are removed by the POTW. When the system is upgraded to advanced treatment in the late 1980s, higher removal credits for ammonia can also be allowed.

If removal credits are not granted, Republic must spend at this one plant several million dollars for additional phenol removal and substantially increase its current operating costs to remove ammonia. The compliance date for this facility is July 10, 1985, so Republic must act soon if it is to meet this deadline.

2. Armco Inc., Middletown, Ohio

Coke Plant

This facility currently discharges partially treated coke plant flushing liquor into the Middletown, Ohio, POTW. The pretreatment system is currently not meeting the categorical pretreatment standards. Preliminary data on POTW removal efficiency, however, suggest that the combined removal achieved by pretreatment and the POTW is at least equal to and probably greater than the categorical standards.

If the POTW receives authority to grant removal credits of 82% for phenol and about 70% for ammonia, the Middletown Works will not be required to provide expensive, additional pretreatment facilities. However, should the POTW not receive removal credit authority, Armco is faced with spending several million dollars for a phenol removal system and to increase substantially current operating costs to remove additional ammonia.

The City of Middletown is currently in the process of applying for approval to grant removal credits for phenol and ammonia. Based on historical operating data, it is probable that the City will be granted the authority to give removal credits in the range of those outlined. Based on the probability that removal credits will be granted, Armco has delayed installation of additional pretreatment facilities. If, however, the credits are denied or delayed in EPA's administrative procedures, then the coke plant will physically be unable to comply with the categorical pretreatment standards by the July 10, 1985 deadline.

3. National Steel Corporation, Great Lakes Steel Division, Detroit, Michigan

The Great Lakes Steel Division plant currently discharges partially treated coke byproduct plants wastewater into the Detroit wastewater treatment system in compliance with their sewer use ordinance. Removal efficiency data on the POTW show that the combined removal of phenol by existing

retreatment and the POTW is at least euqal to and probably greater than that required by the categorical pretreatment guidelines. The POTW has filed an application for permission to grant removal credits for phenol. If such authority is granted, Great Lakes will not be required to provide expensive additional pretreatment facilities with their accompanying operational costs. If the removal credits are denied or delayed in the administrative procedure, then Great Lakes faces the risk of being unable to comply with the categorical pretreatment guidelines by the specified date of July 10, 1985.

These three examples clearly illustrate the dilemma brought about by the combination of deadlines and removal credit provisions of the current Clean Water Act. AISI strongly recommends that the Act be amended to allow local POTWs more flexibility in the handling of their pretreatment programs. This flexibility should provide to the POTW authority to grant case-by-case extension of pretreatment compliance deadlines were preliminary evidence suggests removal credits are appropriate. The suggested removal credit program would be to allow a POTW a reasonable time, say, up to six months from enactment of Clean Water Act amendments, to submit an application for removal credits. EPA could then temporarily stay the pertinent categorical pretreatment standards until it acted upon that application, perhaps within another four to six months. If the application is granted,

the POTW's NPDES permit should be modified to authorize the operation of an alternative local pretreatment program and the stay of categorical pretreatment standards should be extended. In the unlikely case that the application were denied, the categorical pretreatment standards would on the date of denial become effective and enforceable and compliance therewith required in the shortest practical time.

We believe that such a program could be fully workable and would bring pretreatment on a schedule quite comparable to that of direct dischargers.

Another procedural problem in the program is total plant compliance with two or more sets of pretreatment standards for the same point of discharge. It is likely that a plant will have electroplating/metal finishing operations and iron and steelmaking operations adjacent at the same location. As noted earlier in the testimony, the compliance date for electroplating/metal finishing is June 30, 1984 and for iron and steel is July 10, 1985. Thus, the combined plant outfall has a "moving target" compliance deadline. We recommend that the Act be simply amended to require that a facility meet the applicable pretreatment standards three years after promulgation of the <u>last</u> set of regulations applicable to each specific facility.

In another area, proposals have been made for the establishment of new provisions in the water quality standards program, particularly for "toxic" pollutants, and for a

mechanism to deal with "toxic hot spots" in streams. There has been considerable pressure to freeze present water quality standards and to impose new water quality standards for all of the "toxic" pollutants listed in the Act. AISI does not believe that any amendments to the Clean Water Act are essential to provide for adequate protection of water quality through the mechanism of water quality standards. EPA has just issued revised regulations for the establishment and maintenance of water quality standards, which we believe provide very adequately for maintenance and improvement of water quality. Concern has been expressed about the possibility of "downgrading" water quality. The new regulations would not permit this. Some of the current designated water uses and standards do not represent uses now attained or even potentially attainable but are the results of hasty and sometimes improper rulemaking. Thus, revised standards for those streams would involve at least maintenance of existing uses and no real degradation.

One of our member companies, Armco Inc., has submitted for the record a statement concerning three examples of this type of water quality standards problem. I will not go into the details of these examples. Mr. Bruce Steiner, Manager of Environmental Engineering of Armco Inc., is here with me today and would be glad to discuss them in more detail. We believe, however, that these and other examples are indicative of the current problems of water quality standards and

that they can be solved by a regulatory approach rather than any amendments to the Act.

There has also been considerable pressure for the establishment of water quality standards for all of the "toxic" pollutants in the Act. We believe strongly that water quality standards should be set for protection of the appropriate uses. However, with respect to many of these toxic pollutants, there is a dearth of data on the presence of these pollutants in the nation's waters, and there are simply no data available on the toxicology of these materials which provide an adequate basis for the establishment of water quality standards. For many, analytical techniques have only recently been developed. Yet it has been proposed the Act be amended to include a specific timetable requiring standards development. It is AISI's belief that a legislative timeframe forcing EPA to make premature regulatory decisions without an adequate scientific basis is not good legislation. Therefore, we recommend against such a proposal.

We thank you very much for this opportunity to appear before you to express our opinions on amendments to the Clean Water Act. We will be happy to provide any additional information you require and will be happy to provide any assistance in the drafting of effective amendments to the Clean Water Act.

Mr. ROE. Please proceed.

TESTIMONY OF WILLIAM L. WEST, DIRECTOR OF ENVIRONMENTAL CONTROL, REPUBLIC STEEL CORP. AND CHAIRMAN OF THE AISI COMMITTEE ON ENVIRONMENT ON BEHALF OF THE AMERICAN IRON AND STEEL INSTITUTE, ACCOMPANIED BY BRUCE STEINER, MANAGER OF ENVIRONMENTAL ENGINEERING, ARMCO, INC.

Mr. ROE. Would you identify your colleague for the record.

Mr. WEST. Thank you, Mr. Chairman and members of the subcommittee. I am William L. West, director of environmental control for Republic Steel Corp. I am accompanied today by Bruce Steiner who is a manager of environmental engineering at ARMCO, Inc. We are appearing here today on behalf of the American Iron and Steel Institute, a principal trade association for the American steel industry whose 60 domestic member companies represent about 86 percent of the steel production capacity in the United States.

I am chairman of AISI's committee on environment. We are most appreciative of this opportunity to appear today.

In the interest of time, I will summarize my statement but ask respectively that our full written statement appear in the record.

Mr. ROE. Your full statement has been entered into the record.

Mr. WEST. On August 2, 1983, I appeared before this subcommittee to present the viewpoints of AISI on amending the Clean Water Act. At that time, I discussed the background of the steel industry and of our concern with the Clean Water Act.

When I testified previously, I stressed our industry's urgent need for extending the deadlines under the Clean Water Act, particularly the July 1, 1984, deadline in the act for compliance with technology-based requirements. We still believe that it is essential that the Clean Water Act be amended to extend the deadline for these technology-based requirements by a period of 42 months after the date of enactment or 36 months after the imposition of specific limits for industrial operations, whichever is later.

Today, I would like to concentrate on two other very important issues: One, the pretreatment program, and two water quality standards.

It has long been recognized that the joint treatment of industrial and municipal wastes can in many cases provide an extremely cost-effective method of eliminating pollution and achieving water quality goals. The Congress clearly recognized the advantages of this joint treatment in establishing the pretreatment program provisions in the Clean Water Act.

EPA has established a pretreatment program attempting to implement the provisions of the present Clean Water Act. It is now clear that there are three problems which make the present program so unworkable that the act should be amended. These problems are the issue of removal credits, the deadlines established in the law, and the moving target problem. The problems of deadlines and removal credits are inextricably bound together and today put industry in a real dilemma.

As to the deadline problem, I can cite the experience of my own company which has several facilities that discharge to POTW's. Republic filed the EPA-mandated baseline reports for all eight facilities by the April 6, 1983, deadline. As of November 1, 1983, Republic has received no response from EPA, nor from State agencies, nor from the local POTW's as to the completeness of our proposed plan of action.

EPA has now stated that they will promulgate new removal credit provisions in early 1984. Should these final provisions be substantially different from the September 1982 proposal, Republic would need to amend the baseline reports and can do so within the 180-day mandate. Clearly, the compliance deadline of June 30, 1984, for six of Republic's eight facilities, will have passed within this timeframe. It is very doubtful that such a schedule would allow compliance by July 10, 1985, for at least one of the two iron and steelmaking facilities. Industrial dischargers should not be precluded from the credits provided by Congress in the act simply because the administrative procedures for implementing the program have not been developed in a timely fashion.

This problem can be illustrated in detail by the three examples in our prepared statement.

These three examples clearly illustrate the dilemma brought about by the combination of deadlines and removal credit provisions of the current Clean Water Act. AISI strongly recommends that the act be amended to allow local POTW's more flexibility in the handling of their pretreatment programs. This flexibility should provide to the POTW authority to grant case-by-case extension of pretreatment compliance deadlines where preliminary evidence suggests removal credits are appropriate.

The suggested removal credit program would be to allow a POTW a reasonable time, say, up to 6 months from enactment of Clean Water Act amendments, to submit an application for removal credits. EPA could then temporarily stay the pertinent categorical pretreatment standards until it acted upon that application, perhaps within another 4 to 6 months. If the application is granted, the POTW's NPDES permit should be modified to authorize the operation of an alternative local pretreatment program and the stay of categorical pretreatment standards should be extended. In the unlikely case that the application were denied, the categorical pretreatment standards would, on the date of denial, become effective and enforceable and compliance therewith required in the shortest practical time.

We believe that such a program could be fully workable and would bring pretreatment on a schedule quite comparable to that of direct dischargers.

Another procedural problem in the program is total plant compliance with two or more sets of pretreatment standards for the same point of discharge. The combined plant outfall has a moving target compliance deadline. We recommend that the act be simply amended to require that a facility meet the applicable pretreatment standards 3 years after promulgation of the last set of regulations applicable to each specific facility.

In another area, proposals have been made for the establishment of new provisions in the water quality standards program, particu-

20-955 O—84——160

larly for toxic pollutants, and for a mechanism to deal with toxic hotspots in streams.

There has been considerable pressure to freeze present water quality standards and to impose new water quality standards for all the toxic pollutants listed in the act. AISI does not believe that any amendments to the Clean Water Act are essential to provide for adequate protection of water quality through the mechanism of water quality standards.

EPA has just issued revised regulations for the establishment and maintenance of water quality standards, which we believe provide very adequately for maintenance and improvement of water quality. Concern has been expressed about the possibility of downgrading water quality. The new regulations would not permit this.

Some of the current designated water uses and standards do not represent uses now attained or even potentially attainable but are the results of hasty and sometimes improper rulemaking. Thus, revised standards for those streams would involve at least maintenance of existing uses and no real degradation.

One of our member companies, Armco, Inc., has submitted for the record a statement concerning three examples of this type of water quality standards problem. I will not go into the details of these examples. Mr. Bruce Steiner, manager of environmental engineering of Armco, Inc., is here with me today and would be glad to discuss them in more detail. We believe, however, that these and other examples are indicative of the current problems of water quality standards and that they can be solved by a regulatory approach rather than any amendments to the act.

There has also been considerable pressure for the establishment of water quality standards for all of the toxic pollutants in the act. We believe strongly that water quality standards should be set for protection of the appropriate uses. However, with respect to many of these toxic pollutants, there is a dearth of data on the presence of these pollutants in the Nation's waters, and there are simply no data available on the toxicology of these materials which provide an adequate basis for the establishment of water quality standards.

For many, analytical techniques have only recently been developed. Yet, it has been proposed the act be amended to include a specific timetable requiring standards development. It is AISI's belief that a legislative timeframe forcing EPA to make premature regulatory decisions without an adequate scientific basis is not good legislation. Therefore, we recommend against such a proposal.

We thank you very much for this opportunity to appear before you to express our opinions on amendments to the Clean Water Act. We will be happy to provide any additional information you require and will be happy to provide any assistance in the drafting of effective amendments to the Clean Water Act.

Mr. ROE. Thank you very much, Mr. West.

Mr. Steiner.

Mr. STEINER. I have nothing to say.

Mr. ROE. The gentleman from Arizona.

Mr. MCNULTY. No questions.

Thank you, Mr. Chairman.

Mr. ROE. Thank you very much.

Mr. WEST. Thank you, sir.

Mr. ROE. We appreciate your testimony.

Our next group is the National Environmental Development Association; Mr. William Haun, chairman of the NEDA clean water project and vice president of energy policy, General Mills, Inc.; Mr. J. Jeffrey Zimmerman of NEDA/WATER's Technical Committee and manager, external affairs, health and environment, Occidental Petroleum Corp.

Mr. STANGELAND. It is my distinct pleasure to welcome Dr. Haun to the subcommittee today. Dr. Haun received his Ph.D. in chemical engineering from the University of Texas. His many years of valuable research with General Mills and elsewhere are direct evidence of his capabilities.

Dr. Haun serves on numerous national and international bodies, especially on environmental issues. I am especially pleased with his selection as Engineer of the Year in Minnesota. Dr. Haun has been an expert witness for clean water issues for several decades. He is now serving as Chairman of the National Environmental Development Association's Clean Water Project and Industry Labor Coalition.

I am sure the committee will gain a good deal of useful information from this panel who are very knowledgeable witnesses.

Mr. ROE. Does the good doctor come from Minnesota originally, is that your home State?

Dr. HAUN. No, sir. I was born in Alabama. I have moved around. I am a modern-day nomad, Mr. Chairman.

Mr. STANGELAND. Is it true, Dr. Haun, that you were the person in charge of devising and developing the Betty Crocker Kitchens at General Mills?

Dr. HAUN. Yes.

Mr. STANGELAND. And having achieved a great deal of success with that endeavor, he ended up becoming a vice president.

Mr. ROE. We need a good cook around here too.

We welcome you very much, Dr. Haun and Mr. Zimmerman.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT
by the
National Environmental Development Association
Clean Water Project
before the
Subcommittee on Water Resources
of the
Committee on Public Works and Transportation
U.S. House of Representatives

November 10, 1983

Good afternoon, Mr. Chairman and Members of the Subcommittee. My name is J. William Haun. I am Vice President of General Mills and I am here today speaking for the Clean Water Project of the National Environmental Development Association, of which I am chairman.

With me are Mr. Jeff Zimmerman of Occidental Petroleum, chairman of the Project's Technical Committee, and Mr. James Sheets of the Laborers' International Union, AFL-CIO.

The NEDA Clean Water Project is a coalition of industry, labor, agriculture and other interests seeking a balanced consideration of issues relating to the Clean Water Act.

Today, we will present recommended changes to the Act dealing with Pretreatment, Compliance Deadlines, Integrated Facilities, Permit Life, De Minimis Exemptions, Intermittent Streams and Construction Grants.

Perspective

Mr. Chairman, before we offer our recommendations for amendments to the Clean Water Act, I would like to bring into perspective the pollution sources which are the central focus of these hearings.

It is often assumed that industrial dischargers are responsible for the largest share of water pollution. Let's examine the facts: Chart A shows the overwhelming majority of water pollutants are not coming from point sources subject to regulation under the Clean Water Act. With the exception of dissolved heavy metals, the chart shows that nonpoint sources, far and away, contribute the greatest amount of water pollution.

This is not to say that there is no room for improvement among industrial dischargers, particularly in the area of toxic pollutants. Rather, we make this point simply to put into perspective the net result of further regulation of point-source dischargers.

Second, among point-source dischargers, one group stands out above all others in the amount of water pollution emitted. Chart B shows total amount of pollutants for the top 10 point source groups. Within this category, publicly owned treatment works are compared to nine industrial sources.

This comparison clearly shows that the image of industry as the nation's principal polluter is not based on fact. Point sources contribute only a fraction of the overall water pollution and, among point sources, industry is not the major polluter.

We bring this to the attention of the Subcommittee not to sidestep our responsibility for improving water quality or blame others. Rather, we hope that this perspective will be kept in mind as the Subcommittee and Congress seek meaningful ways to increase the effectiveness of the Clean Water Act.

Recommendations

We are here today to urge the Subcommittee to amend the Clean Water Act to...

...achieve more widespread and effective water pollution control;

...accelerate the process of cleaning up the nation's waters;

...reduce the tangle of red tape which interferes with the above goals and results in undue cost to the public.

The NEDA Clean Water Project offers recommendations which will make the Clean Water Act more comprehensible, less complex and a more efficient vehicle for attaining the nation's water pollution control objectives. The Act needs strengthening through clarification and simplification.

Mr. Chairman, over the past few weeks you have received a great deal of information concerning the Clean Water Act, much of it in support of positions similar to those of the NEDA Clean Water Project. Therefore, we will not give you yet another treatise on these issues. We will briefly highlight our major concerns, with a more detailed treatment of the issues provided separately to the Subcommittee.

Also, we have listened to the questions that you and other members of this Subcommittee have been asking in the course of these hearings, and we will try to answer some of those questions in our remarks today.

Here to present our recommendations for changes to the Clean Water Act is Jeff Zimmerman, chairman of the Project's Technical Committee.

Statement by Jeffrey Zimmerman

Mr. Chairman and Members of the Subcommittee, we thank you for this opportunity to discuss our recommendations for changes to the Clean Water Act.

Echoing the remarks of Dr. Haun, I would like to begin by emphasizing that the following changes to the Clean Water Act are intended to result in a national program which will attain more pollution control, faster and at less public cost.

Pretreatment

The NEDA Clean Water Project supports the concept of pretreatment for certain industrial wastes. Specifically, we support without change, the objectives of the program which are to pretreat pollutants which:

(1) are not susceptible to treatment by POTWs and which, therefore, would pass into the water body untreated;

(2) interfere with the operation of the treatment works; or

(3) interfere with the proper disposal of sludge.

We also support Congress' intent to encourage joint treatment through a municipal treatment plant. Congress believes, and we agree, that joint treatment is a cost-effective and efficient way of controlling water pollution.

It is in the mechanisms for implementing the program where we and others, including state and local government, see the program's greatest weakness and where, we believe, the Committee should concentrate its attention.

Why is the pretreatment program a problem to industry? Very simply, it will result in redundant treatment of wastes at great and needless cost to industry and, ultimately, the public.

Consider this example: Since 1981, an aluminum plant has been discharging its waste into a local POTW. The waste contains small quantities of heavy metals and considerably larger quantities of aluminum in the form of soluble aluminum hydroxide.

The impact of the discharge on the POTW has been closely studied. Not only has the discharge not harmed the POTW, it has actually improved sludge settling and thickening performance, saving the POTW money.

Under the federal pretreatment program, this aluminum plant must pretreat its waste before discharging to the POTW. It will cost the discharger millions of dollars, and it will take away from the POTW certain performance improvements it now enjoys.

POTWs can effectively treat many of industry's wastes without any industrial pretreatment. While the current program recognizes this and theoretically provides for "removal credits," this credit program is so complicated that it defies comprehension. The result is that many local POTWs refuse to implement the program because of

its complexity -- a fact which will undoubtedly be aired in next week's testimony before this Subcommittee -- and industry is forced to unnecessarily pretreat wastes which could be removed by these POTWs.

EPA's recent moves to simplify the program by creating "national removal credits" apply to only a few pollutants and are consequently of little use.

Therefore, we recommend that the Act be changed to allow qualified local POTWs to establish their own pretreatment program which would be as good if not better than the federal program in terms of pollution control. We do not advocate eliminating the federal program. That program would remain in effect unless a POTW successfully qualifies to implement its own local program. The effect on water quality would be the same as or better than the federal program, with only the methods being different.

How would we measure whether the results are at least as good as the federal program? There are several possible methods. One is to measure effluent at the end of the POTW pipe to see if it is the same as it would have been under the federal program. Another is to measure against water quality standards in the receiving water, and another is to study the effects of effluent on biota in the water body.

Under the federal pretreatment program, the only tests to show compliance with permit limitations are those by POTWs. The federal program simply requires that a company install technology necessary to meet the national categorical pretreatment standards. The program does not measure the effects on the water body. Our recommended change goes a step beyond what the federal government now requires.

Would such an approach reduce protection of human health? Not at all. In fact, the federal program, as it is now structured, addresses control technology -- not the effect on the water body or human health. Our approach would at least move us a step closer to measuring these effects.

In short, we recommend that eligible POTWs, those in compliance with the Clean Water Act or on a compliance schedule, be allowed to operate their own pretreatment program. POTWs which are under construction could apply later to implement their own programs. We would be pleased to provide the Subcommittee with more details about how this alternative program could be structured.

Pretreatment of Compatible Pollutants

Another important issue in the pretreatment area is that of compatible pollutants. There is sufficient history in the record to show that it was not the intent of Congress to require industry to

pretreat recognized compatible pollutants -- conventional pollutants toward which POTW technology is directed. Nonetheless, EPA after the 1977 amendments acted counter to Congressional intent by encouraging cities with inadequate or poorly operated POTWs to require pretreatment of conventional pollutants by users, rather than correct the problems of POTWs.

We believe that ensuring the construction and proper operation of needed POTWs has been the basis for this federal pollution control program. Congress should not allow EPA to continue substitution of pretreatment of conventional pollutants for properly functioning POTWs.

Compliance Deadlines and Integrated Facilities

Because of the inability of the Environmental Protection Agency to promulgate effluent guidelines in a timely manner, there is a serious problem in complying with Best Available Technology Economically Achievable (BAT) and Best Conventional Technology (BCT) deadlines as set forth in the Act.

Simply stated, industry can't comply with requirements which don't exist or which have only recently been promulgated.

To deal with this in an equitable manner, we propose that dischargers be given 3 years to comply with BAT or BCT requirements

after EPA issues the applicable effluent guideline. This approach would treat everyone equally, regardless of when effluent guidelines are promulgated.

Some proposals take this approach but also incorporate a closing date, such as July 1, 1987. The rationale for an arbitrary closing date is to avoid extensive delays in compliance because a guideline has not been promulgated. Also, it is believed that a closing date will cause industry to put pressure on EPA to develop the guideline in sufficient time -- a practice which has yet to work.

The EPA schedule for promulgating effluent guidelines has once again slipped and, if July 1, 1987 is the deadline, there are already several industries which will have less than 36 months to comply.

If this Subcommittee is favoring a fixed deadline, we encourage the Subcommittee to set a reasonable period of time in which industry can comply with requirements or, once again, we will be back asking for yet another extension.

A parallel problem regards what we call "integrated facilities," which are dischargers subject to more than one guideline, particularly those required to pretreat their wastes.

An example from our membership concerns a diversified manufacturing plant -- consisting of 6 manufacturing buildings on 1,800 acres. All wastewater is treated at one facility. In all, there are 60 regulated processes with over 20 miles of wastewater pipe with a flow of 6 to 7 million gallons per day.

This plant is subject to six pretreatment categories, four of which have been promulgated, one which has been proposed, and another which has yet to be proposed. Until all the standards are known, this plant will not be able to calculate what the ultimate end-of-pipe limitations will be. In the meantime, the compliance clock is ticking on those standards which have already been issued.

EPA issues pretreatment standards one at a time, and the compliance clock starts running at the time the first applicable pretreatment standard is issued. Integrated facilities are faced with having to plan, design, and construct pretreatment systems far in advance of knowing all the standards they will ultimately have to meet. In many cases, it is physically impossible for integrated facilities to comply with sequentially issued pretreatment standards.

The solution is to set a single compliance deadline, requiring integrated facilities to be in compliance with effluent guidelines or pretreatment standards three years from the time the last

applicable standard is promulgated. If the Subcommittee considers coupling this with a fixed compliance deadline, it should be careful to allow a reasonable period, since the problem of timely promulgation is compounded for integrated facilities.

Permit Life

EPA now faces a backlog of approximately 30,000 permit applications. Of the initial permits issued in the program, 44,000 were granted without final effluent guidelines and must be modified when those guidelines are promulgated. The need for renewal of permits every five years, or even more frequently in many instances, subjects EPA and the state agencies to substantial administrative burdens.

Many of the organizations which have testified before this Subcommittee, as well as the NEDA Clean Water Project, recommend that the maximum life for NPDES permits be extended from 5 to 10 years.

This raises the issue of when and under what circumstances permits can be reopened. Under current regulations, there are several provisions which allow for reopening of permits, including a mandatory reopener any time a new toxic effluent standard is developed. We support this and other reopener provisions in current

regulations. If EPA is concerned about the effect of changing cleanup requirements and its ability to reopen the conditions of the permit, it has the option to either issue the permit for a shorter period of time or propose changes to its reopener regulations.

De Minimis Exemptions

The majority of Clean Water Act permits are for minor discharges. Literally thousands of NPDES small-source discharge permit applications, some written as long ago as 1972, are awaiting action.

An illustration of the problem is an actual case where a company's drinking fountain, because of its location, drains its overflow into a water body. That drinking fountain requires an NPDES permit, and there is no provision allowing it to be exempted.

The EPA Administrator should be allowed to exempt de minimis point source discharges and channeled stormwater runoff containing de minimis quantities of pollutants from the NPDES permit procedure. Determination of eligibility for exemption should be based on concentration, volume and type of discharge.

The Senate Committee has, in part, recognized this point and has included in S.431 exemptions for channeled stormwater runoff which contains no pollutants for oil, gas, and mining industries. However, we see no reason to limit this exemption to certain industries or types of discharge. All discharges which contain little or no pollutants should be eligible for exemption.

Intermittent Streams

In adopting water-quality-based standards, states have traditionally applied them to all streams, with little or no field studies to determine whether or not the criteria are appropriate.

This has resulted in requiring facilities to install water pollution controls on discharges into intermittent streams where the effluent is the sole source of stream flow. Application of such control technology is, in many cases, unnecessary, inappropriate, and needlessly expensive.

Water quality standards should only be applied to intermittent streams (streams not having a constant, natural flow) in cases where the Administrator or the state agency determines it is necessary for protection of aquatic life in the perennial stream.

20-955 O—84——161

Mr. Chairman, the final topic we would like to cover in our statement is Construction Grants. Here to present information on construction grants is Mr. Jim Sheets of the Laborers' International Union.

Statement by James Sheets

Construction Grants

As pointed out earlier in this testimony, the largest single sources of water pollution in this country are municipal treatment works. You have received testimony which discusses the fact that many municipalities are not in compliance with the law.

We are aware of areas which even today have no wastewater treatment. EPA estimates that by the year 2000, $118 billion will be needed for the construction of wastewater treatment plants. Congress has only made a dent in these needs.

The inability of municipalities to meet their pollution control obligations creates serious problems, not only in regard to the environment but also with regard to an area's economic health. You have heard that nearly one-half of the nation's communities are unable to add additional homes or businesses to their sewage treatment systems because they are already operating at full

capacity. If a production facility is prohibited from locating in a particular site or expanding an existing facility because of inadequate municipal sewage treatment, the municipality could suffer the economic hardship of losing a major source of new jobs and tax revenue.

If, in order to offset pollution from municipal discharges, a producer is required to use more expensive controls to balance the effect of municipal waste, he might be forced to look for another site where pollution cleanup costs are more equitably shared.

Only adequate funding and legislative and program reforms will assure that dollars are spent productively to control the nation's water pollution problems. The reduction in funding to $2.4 billion a year does not mean that the overall cost of the municipal cleanup has gone down. In fact, if the reduction in funding has slowed the progress of the program -- which is likely -- the overall cost of the program is likely to rise as the stalled projects are hit with inflation.

Over the past few weeks, you have heard a variety of opinions about what to do about this problem. The opinions have ranged from increasing federal grants to phasing the program out entirely and allowing municipalities to develop their own source of funds.

We seriously question the ability of municipalities to raise these cost-sharing funds under the current program, let alone raise 100 percent of these funds.

There have been innovative suggestions such as privatization of POTWs and allowing federal grants to be used for low interest loans. We do not pass judgment on these suggestions, they may be workable. However, today we are faced with an ever increasing need to get these plants up and running. The most immediate vehicle for getting funds in the hands of municipalities is the existing construction grants program. Consequently, we support the funding provisions now included in Chairman Howard's bill H.R.3282.

Thank you for your attention. We will be happy to answer your questions.

CHART A

Point *vs.* Nonpoint: Where Does Pollution Come From?

Point Sources — Pollution which is discharged through a discrete pipe or ditch.

Nonpoint Sources — The effects from urban runoff, construction, hydrologic modification, silviculture, mining, agriculture, irrigation return flows, solid waste disposal, and individual sewage disposal.

Source: Council on Environmental Quality, *Environmental Trends*, July 1981

CHART B

POTWs *vs.* Industry: Who Pollutes the Most?

The image of industry as the nation's principal point-source polluter is not based on the facts. As the figures to the right conclusively show, municipal sewage facilities, referred to as Publicly Owned Treatment Works (POTWs), contribute the most pollution to waterways. This chart shows total amount of pollutants for the top 10 point source sectors. POTW pollutant loadings have been contrasted with the remaining nine sectors.

Publicly Owned Treatment Works

CLEAN WATER PROJECT
NATIONAL ENVIRONMENTAL DEVELOPMENT ASSOCIATION, 605 Fourteenth Street, NW, Washington, DC 20005 • 202 638-1230

The Clean Water Act: Congress Takes Another Look

"The challenge is to develop programs which effectively implement the law's intent and principles without frustrating the best efforts of both industry and government."

Congress faces a challenging job: reauthorization of the landmark Federal Water Pollution Control Act, also known as the Clean Water Act.

- Is it a perfect law?
- Is there room for improvement?
- What improvements are needed?

Enacted in 1972 and amended in 1977, the Act has been heralded by environmentalists as the "perfect example" of achieving widespread benefit through legislative initiative. American industry — which has borne the main burden of implementing the Act — and segments of organized labor see the Act as far from perfect and want a number of changes made during the reauthorization process.

Early last spring, speculation in Washington was that EPA would develop a list of amendments to the Act which would be compatible with those sought by industry.

When the Administration's bill finally emerged in late May, however, it succeeded in upsetting both environmentalists and industry in nearly equal degrees.

Environmentalists claim that EPA's proposed amendments would greatly weaken the Act and several industry groups feel that some of the most urgently needed reforms were ignored.

Congress has now waded into the controversy by holding hearings, in both the House and the Senate, on the Clean Water Act reauthorization. (An account of those hearings is contained in this publication, with details on the recommendations given to Congress by NEDA/Water.)

Key players in the issue on Capitol Hill include John H. Chafee (R-RI), chairman of the Senate Environmental Pollution Subcommittee, and Robert A. Roe (D-NJ), chairman of the House Water Resources Subcommittee.

Chafee has made it clear that he believes the Act should be reauthorized without substantive amendment.

Roe feels there is not sufficient time in this legislative session to properly weigh the alternatives and come up with well-crafted amendments. He favors a simple one-year reauthorization of the Act with the understanding that it will be taken up next year.

continued on page 8

NEDA Urges Congress to Make Federal Law Simple, Realistic, Flexible

J. William Haun, chairman of the NEDA Clean Water Project, called on Congress to remove "the flaws which have caused confusion, frustration and friction between those who regulate and those who are regulated" under the Clean Water Act.

Testifying before the Senate on July 21 and before the House on July 29, Haun pointed to excessive complexity, regulatory inefficiencies and unrealistic expectations in the Act.

Haun said that these weaknesses often have caused industry and government to be cast in the role of adversaries "because of problems in the Act which we now have the opportunity to correct."

Reminding members of Congress that he participated in the 1971 hearings on clean water, Haun stated: "Ten years' experience with the law provides us with valuable insight into both the strengths and weaknesses of the Act. There can be no question that the strengths of the Act have brought many tangible benefits. However, with 10 years of success

continued on page 7

J. William Haun, chairman of NEDA/Water, urged Congress to eliminate the problems that hamper the efforts of both government and industry to comply with the intent of the Clean Water Act.

Here Are Issues Needing Attention, Says NEDA

The NEDA Clean Water Project, made up of environmental professionals with extensive experience in the implementation of the Clean Water Act, has developed recommendations for amendments to the Act.

The thrust of these recommendations is to simplify and clarify provisions of the Act which are now causing unnecessary regulatory burdens on industry and government, without significant offsetting environmental benefits.

The NEDA Clean Water Project hopes, through its examination of the issues and its recommendations, to contribute constructively to Congressional consideration of the law's legislative and regulatory problems.

Following are summaries of the NEDA Clean Water Project's recommendations. More detailed information may be obtained by contacting NEDA.

De Minimis Exemptions

The Clean Water Act requires that a NPDES permit must be obtained for a point source discharge even if the discharge is small and contains only minute quantities of benign pollutants. The law even requires a permit for uncontaminated stormwater runoff channeled into ditches around an industrial plant.

The effect of unnecessary permitting requirements is an undue burden upon permit-issuing agencies. A 1979 survey by the Association of State and Interstate Water Pollution Control Administrators revealed that about 51 percent of all permits issued involve relatively insignificant facilities with respect to point source pollution. Meanwhile, literally thousands of NPDES small-source permit applications are waiting for action by permitting agencies, some applications submitted as long ago as 1972.

De minimis point source discharges and channeled stormwater runoff containing de minimis amounts of pollution should be exempt from NPDES requirements.

Compliance Deadlines

Because EPA has not been able to promulgate final guidelines, large segments of American industry will not be able to meet the July 1, 1984 deadline for installing Best Available Technology Economically Achievable (BAT) and Best Conventional Technology (BCT) controls.

Even if EPA published final guidelines today, the affected industrial facilities could not be brought into compliance by the statutory date since it typically takes about three years to design, purchase, manufacture and install new treatment facilities.

NEDA/Water recommends that, recognizing realities, Congress should amend the law so that when EPA promulgates requirements, industry will be encouraged to comply as expeditiously as practicable, and in any event, within three years.

Section 301 of the Act should be amended to allow for BAT compliance three years after effluent guidelines have been promulgated. Uniform national deadlines for control technology installation should be avoided since they would set up inequitable compliance situations; instead, Congress should provide guidance to EPA on developing a timetable for the issuance of guidelines. In order to provide equity among industrial operations, sources should have three years from the date of promulgation of a BAT guideline for particular categories or classes. If a source's discharges are subject to two or more categorical effluent guidelines, a source should have three years from the date of promulgation of the latest BAT guideline.

BAT Determinations

The Act requires industry to install increasingly more stringent water pollution controls. The first level of control — Best Practicable Technology (BPT) — was required in 1977. The next level — Best Available Technology Economically Achievable (BAT) for toxic pollutants and Best Conventional Technology (BCT) for conventional pollutants — is to be installed by 1984.

However, there is growing evidence that, for many industries, the installation of water pollution controls beyond those required under BPT may not significantly improve water quality. Studies indicate that there are far fewer toxic pollutants present in treated industrial and municipal effluents than was previously assumed due to the unexpectedly effective treatment of toxics by BPT. EPA now forecasts that many industries will be able to achieve the law's more stringent BAT requirements with their current level of treatment.

Therefore, in developing various categories of BAT effluent guidelines, the adequacy of BPT to remove toxic pollutants should be taken into account. The EPA Administrator should be allowed to set BAT as equal to BPT where control beyond BPT would not result in significant additional removal of pollutants.

NPDES Permit Life

Under present law, NPDES permits must be renewed every five years even though it frequently takes more than one year for the final permit to be issued and typically takes three years to design, purchase and install treatment technology. A five-year permit life allows little time for the permit holder to test the effectiveness of the treatment before the permit renewal application process begins again. Further, EPA is facing a backlog of approximately 60,000 permit applications.

This substantial administrative burden could be relieved by extending the maximum allowable life of an NPDES permit from five to 10 years.

Zero Discharge

At first glance, the goal stated in Section 101(A) of the Act, that "discharge of pollutants into the navigable waters be eliminated by 1985," appears to be a worthy if ambitious aspiration.

continued at right

Congress could not foresee, however, that the goal would be literally interpreted to mean zero *discharge* of pollutants in even the smallest amounts regardless of the difficulty or cost related to the absolute elimination of water-borne pollution. EPA and the courts have used the goal to move toward increasingly stringent discharge guidelines which often provide little, if any, environmental benefit.

Assuming that the goal could be met in certain cases, attainment of "zero discharge" in waters often would only cause the pollutant to be transferred to another portion of the environment: air or land or within geological formations.

The NEDA Clean Water Project recommends that the language of Section 101(A)(1) be amended to delete the 1985 attainment date and require a study to be conducted to determine the appropriateness of the "zero discharge" goal. Results of the study should be presented to Congress prior to the Act's next reauthorization, NEDA/Water believes.

Dredged or Fill Materials

Section 404 of the Clean Water Act authorizes the Secretary of the Army to issue permits for the deposition of dredged or fill material into the waters of the United States and at disposal sites designated by EPA guidelines.

Problems abound with this section of the Act. Permit decisions hinge on EPA consultation with a number of other federal agencies such as the Fish and Wildlife Service. This causes confusion and delay. Further confusion is caused by the lack of definition of what constitutes "adjacent wetlands" where permits are required.

The scope of the program should be clarified. Technically quantifiable criteria should be used to determine whether permits are required. Present functions of the EPA should be transferred to the Corps of Engineers. The permit programs which are currently part of the dredged or fill program should be expanded to incorporate inundated land areas. The permit process should be streamlined.

BAT Modifications

Congress allows EPA to grant modifications to the more stringent technology requirements for nonconventional pollutants based on the fact that under certain conditions, water bodies can absorb pollutants without harming water quality. Congress specified stringent tests for these modifications.

In contrast, Congress allows no such modification from BAT limits for toxic pollutants. The Act requires that dischargers install increasingly stringent water pollution controls for toxic pollutants without regard to the effect on water quality.

In Congressional testimony, EPA Deputy Administrator John Hernandez outlined the reasons why allowance for BAT modifications makes sense. He said, "We believe that by carefully targeting BAT controls, we will address the bulk of the toxics problems and will not be forcing industries to adopt incrementally more stringent controls than are necessary to meet water quality standards and protect the environment. In those cases where BAT rules will require treatment for treat-

continued on page 4

continued from page 3

ment's sake, waivers should be available to keep us from wasting resources."

Control-technology modifications from BAT toxic pollutant requirements should be provided for toxic pollutants discharged in insignificant amounts which do not cause and are not likely to cause toxic effects. They should be contingent on stringent tests already applicable to other pollutants. This can be accomplished by repealing the prohibitions in 301(g)(1) and 301(1).

National Environmental Policy Act

To obtain an NPDES permit for a new source, EPA must subtait to a National Environmental Policy Act (NEPA) review and may be required to prepare an Environmental Impact Statement (EIS). These requirements can create an unnecessary expense for the agency and the applicant, and can cause long delays in the permit decisionmaking process.

The NEPA review is redundant. It covers not only water quality effects but includes all media including air, water and solid waste. Other statutes already cover every environmental aspect of constructing a new source. The information required for submission of an NPDES permit is more than sufficient for the agency to determine any potential water quality impacts.

There is a demonstrated need to make EPA's implementation of the Clean Water Act consistent with its implementation of RCRA, the Clean Air Act and other environmental statutes by exempting issuance of new source NPDES permits from NEPA's requirements.

Pretreatment

Pretreatment requirements were established by Congress in 1972 to prevent industrial pollutants from interfering with the proper operation of publicly owned treatment works, and to prevent the pass-through of toxic pollutants into receiving water. Later, the law as amended in 1977 also authorized EPA to develop national technology-based pretreatment standards for toxic pollutants.

In carrying out this program, EPA has developed a complex and sometimes unmanageable plan. In addition, the national pretreatment regulations fail to consider the diversity of design and operation of each POTW and the diversity and variety of wastes handled by each POTW. Pretreatment programs need to be flexible in order to give the POTW latitude to develop its own specifically tailored programs.

In its review of the law, Congress should reassess its position on having EPA require such a complicated program. Experience indicates that pretreatment would be handled better if it were turned back to the states and municipalities so that they can develop their own specially-tailored pretreatment programs. EPA should continue to play a strong role in providing technical guidance to the municipalities

POTWs *vs.* Industry: Who Pollutes the Most?

The image of industry as the nation's principal point-source polluter is not based on the facts. As the figures to the right conclusively show, municipal sewage facilities, referred to as Publicly Owned Treatment Works (POTWs), contribute the most pollution to waterways. This chart shows total amount of pollutants for the top 10 point source sectors. POTW pollutant loadings have been contrasted with the remaining nine sectors.

Publicly Owned Treatment Works

Total, Remaining Nine Sectors

Reflects 1977 data

Source: Council on Environmental Quality, *Environmental Trends*, July 1981

that need it. Ultimately, protection of the environment derives from the enforcement of the POTWs' permit.

BPJ Guidance

In many cases, EPA will not develop the comprehensive set of effluent guidelines meant to provide the basis for Best Available Technology effluent limits in NPDES permits. In the absence of these nationwide BAT guidelines, EPA is likely to substitute unilateral, unreviewed guidance documents for permit writers making ad hoc determinations of BAT.

The setting of case-by-case limits based on the judgment of individual permit writers (referred to as "best professional judgment" or BPJ) can cause considerable variation in treatment of similar industrial dischargers. With no firm guidelines to follow, and looking only to documents which have not undergone scientific peer review, permit writers produce results which contain both wide variations and inequities.

Specific statutory criteria should be taken into account when determining BAT by best professional judgment: (1) the age of the equipment and facilities involved; (2) the engineering aspects of the application and various types of control techniques; (3) process changes; (4) the cost of achieving such effluent reduction; and (5) non-water-quality environmental impact (including energy requirements). Use of these criteria will assure that case-by-case permit limits set by BPJ guidance are based on the same criteria as limits based on nationwide BAT guidelines.

Ocean Discharge

The Act requires that any direct discharger of water, other than those who discharge to a POTW, must obtain a NPDES permit under Section 402. If the discharge is to ocean waters, Section 403 further limits the conditions under which the Section 402 NPDES permit may be issued. The special requirement for ocean waters was devised at a time when Congress was unsure whether the environmental consideration under the Section 402 permit process would sufficiently protect ocean waters.

It is clear today that the NPDES program has been effective in protecting ocean waters. Section 403 adds unnecessary, indefinite procedures and an adequacy-of-data test subject to interpretation by each consultant or permit writer.

The Act should be changed to enable EPA to deny NPDES permits only if unreasonable water quality degradation would occur from the discharge. Also, EPA should be required to limit the examination of ocean discharge impacts and the promulgation of guidelines only to aspects of potential ocean degradation that (1) are not already addressed under Section 402, and (2) are reasonably likely to occur from the type of operation for which a permit is sought. If projects are subject to an EIS requirement, any Section 403 determination should rely on EIS data and analyses, not require redundant analyses.

Restoration of Natural Resources

Section 311 of the Act imposes civil penalties against any discharger of oil or hazardous substances in violation of the Act's guidelines. While such penalties have played a role in the protection of the environment, the guidelines have three major flaws. First, penalties are automatic and do not consider the impact of the spill on the environment. Second, the discharger is liable for the cost of restoration or replacement of natural resources without any consideration of the ecosystem's ability to recuperate. Third, the law indiscriminately applies to all spills, even those which occur within artificial impoundments.

The solutions to these three problems are (1) to make the penalty apply to real need, requiring that no penalty be assessed until spills are proven harmful to the environment; (2) when penalties are assessed, the restorative process of nature should be taken into account and (3) spills which occur in artificial impoundments should be exempt from penalty.

Agricultural Stormwater Discharges

Stormwater discharges from agricultural water management systems become subject to Clean Water Act Section 402 permitting requirements under the definition of "point source" in Section 502(14). Under this definition, structural and mechanical water management systems which handle stormwater in flat land areas become point sources, even though the discharge is similar to discharges which are not confined. The opportunities for pollution reduction by Best Management Practices are similar whether the discharge is confined or unconfined. Moreover, Best Management Practices for agricultural runoff usually require structural detention systems which convert the discharge from the non-point to point source category.

Agricultural stormwater discharges should be excluded from the definition of point source in Section 502(14). State and local programs should continue to control non-point source pollution.

Intermittent Streams

For intrastate water, Section 303 of the Act requires states to adopt water-quality-based standards. Failure of the states to act leads to adoption of water-quality-based standards developed by EPA.

In adopting these standards, states have traditionally applied them to all streams, with little or no field studies to determine whether or not the criteria are appropriate. In some cases this has required plant facilities to install water pollution controls on discharges into intermittent streams where the effluent is the sole source of stream flow. Application of such control technology is expensive, inappropriate and, in some cases, unnecessary.

Water quality standards should be applied at the confluence of the intermittent stream with a perennial stream instead of being applied at the discharge point into the intermittent stream. This would assure the protection of the perennial stream. ■

TOWARD A BETTER CLEAN WATER ACT:
NEDA OFFERS SOLUTIONS TO WATER ACT PROBLEMS

A SUMMARY OF THE SPECIFIC RECOMMENDATIONS MADE TO CONGRESS FOR AMENDMENTS TO THE CLEAN WATER ACT BY THE NEDA CLEAN WATER PROJECT.

De Minimis Exemptions

De minimis point source discharges and channeled stormwater runoff containing *de minimis* amounts of pollution should be exempt from NPDES requirements.

Compliance Deadlines

Recognizing realities, Congress should amend the law so that when EPA promulgates requirements, industry will be encouraged to comply as expeditiously as practicable, and in any event within three years.

Section 301 of the Clean Water Act should be amended to allow for BAT compliance three years after effluent guidelines have been promulgated. Uniform national deadlines for control technology installation should be avoided since they would set up inequitable compliance situations. Instead, Congress should provide guidance to EPA on developing a timetable for the issuance of guidelines. In order to provide equity among industrial operations, sources should have three years from the date of promulgation of a BAT guideline for particular categories or classes. If a source's discharges are subject to two or more categorical effluent guidelines, a source should have three years from the date of promulgation of the latest BAT guideline.

Best Available Technology Determinations

In developing various categories of BAT effluent guidelines, the adequacy of BPT to remove toxic pollutants should be taken into account. The EPA Administrator should be allowed to set BAT as equal to BPT where control beyond BPT would not result in significant additional removal of pollutants.

NPDES Permit Life

The Clean Water Act should be changed to extend the maximum allowable life of an NPDES permit from five to 10 years to ease the permit log-jam and to reduce administrative burdens on industry, EPA and state agencies.

Zero Discharge

The language of Section 101 (A)(1) should be amended to delete the 1985 attainment date and require a study to be conducted to determine the appropriateness of the "zero discharge" goal. Results of the study should be presented to Congress prior to the Act's next reauthorization.

Dredged or Fill Permit

The scope of the dredged or fill permit program should be clarified, particularly in the area of "adjacent wetlands." Technically quantifiable criteria should be used to provide certainty in determining which situations do and which situations do not require a permit. The criteria defining "adjacent wetlands" should be limited to include only those areas which affect the attainment or maintenance of the environmental goals of the Act. "Adjacent" should be limited to areas contiguous to or bordering on waters of the United States. Vegetation- and saturation-related criteria should be dropped from the definition of wetlands, retaining only frequency of inundation and specific time periods between inundations. Substitution of "inundated lands" for "wetlands" would more clearly describe the area which the program is intended to cover.

Present functions of the Administrator of EPA under Section 404 should be transferred to the Secretary of the Army. EPA would participate in the decision process through the normal commenting and consultation procedures in subsections (m) and (q) of Section 404.

The general permit programs currently part of the dredged or fill permit program should be expanded to the maximum extent possible to incorporate inundated land areas.

The permit process should be streamlined, and decisionmaking should be centralized in the Corps of Engineers or the authorized state agency. Most important is a realignment of the relationship between the Corps and the U.S. Fish and Wildlife Service to emphasize that the decision resides with the Corps and it will not be *de facto* delegated to another agency.

Best Available Technology Modifications

Control technology modifications from BAT toxic pollutant requirements should be provided for toxic pollutants discharged in insignificant amounts which do not cause and are not likely to cause toxic effects. They should be contingent on stringent tests already applicable to other pollutants. This can be accomplished by repealing the prohibitions in 301(g)(1) and 301(i).

Those states which have been delegated NPDES permitting authority also should have the authority to grant modifications.

National Environmental Policy Act

NPDES permit applications for new sources should be exempt from NEPA review. An exclusion under the Clean Water Act would make the law consistent with the procedures already effective in other environmental acts. Section 511(c)(1) of the Act should be amended to incorporate this exemption.

Pretreatment

The provisions which require EPA to publish regulations establishing pretreatment standards (including categorical standards for toxic pollutants) should be deleted. EPA should provide guidance for POTWs' development of pretreatment programs.

As a part of the NPDES permits, POTWs should be required to establish pretreatment programs. This would require development and enforcement by POTWs of pretreatment standards.

Section 307(b) of the Act should be amended to focus more clearly on the problems of interference and pass-through from industry discharges to POTWs.

It should be made clear that it is not the intent of Congress to encourage pretreatment of compatible pollutants as a substitute for adequate capacity or proper operation of POTWs. Section 307(b) of the Act should be amended to prohibit EPA from requiring specific pretreatment programs above and beyond those developed by POTWs to meet their permit as a condition for approval of POTW construction grants.

continued at right

Haun Testimony Cites Water Act Weaknesses; Calls on Congress for Needed Changes

continued from page 1

have come 10 years of problems, many of them seriously hampering the efforts of both government and industry to comply with the intent of the Act. If the Clean Water Act is in need of change, and we believe that it is, the needed changes are those which will improve our ability to continue the important work of restoring and protecting our nation's waters."

Haun identified three categories of weakness in the Act: excessive complexity, regulatory inefficiencies and unrealistic expectations.

Haun said the Act's pretreatment provisions are an example of excessive complexity. The NEDA project chairman testified: "The [pretreatment] requirements of this program boggle the mind." He urged Congress to reassess its position on having EPA require such a complicated program, recommending instead that states and municipalities be given the authority to develop pretreatment programs, tailored to local needs.

In the category of regulatory inefficiency, Haun pointed to the massive size of the program, which has resulted from the statutory directives to issue permits for every discharge even if the discharge is insignificant. "One cannot look at this program without being staggered by its scope," he said.

It is estimated that EPA is facing approximately 60,000 permit applications. Of the initial permits issued in the program, 44,000 were granted without final effluent guidelines and must be modified when those guidelines are promulgated. Because of the backlog, there are many dischargers that have been waiting for permit decisions since 1972.

Unrealistic expectations is the third category of weakness in the Act, Haun told Congress. Exemplifying that flaw is the so-called "zero discharge" goal of the Act which calls for complete elimination of water pollution by 1985, he said.

"This goal appears to be unrealistic," Haun testified. He pointed out that 10 years ago, zero discharge would have meant reducing pollutant levels to nondetectable levels, measured in parts per million. Today, he stated, we can measure some pollutant levels down to *parts per trillion*. "We could be discharging the equivalent of drinking water, in some cases, and still not be meeting the goal of zero discharge," he said.

Concluding his testimony, Haun asked Congress to strive for three goals in its review of the Clean Water Act:

- First, he said, the administration of the law should be kept as *simple* as possible so as not to tie up our resources in arguing over complicated programs which don't result in pollution control.
- Second, there is a need to be *realistic*, rather than setting unachievable goals which frustrate both government and the public.
- Third, the law shold be *flexible* enough to deal with unique situations and give those implementing it some leeway in applying its requirements. ■

Best Professional Judgment Guidance

Special statutory criteria should be taken into account when determining BAT by "best professional judgment:" (1) the age of equipment and facilities involved; (2) the process involved; (3) the engineering aspects of the application and various types of control techniques; (4) process changes; (5) the cost of achieving such effluent reduction; and (6) nonwater-quality environmental impact (including energy requirements). Use of these criteria will assure that case-by-case permit limits set by BPJ guidance are based on the same criteria as limits based on nationwide BAT guidelines.

Ocean Discharge Criteria

The Act should be changed to enable EPA to deny NPDES permits only if unreasonable water quality degradation would occur from the discharge. Also, EPA should be required to limit the examination of ocean discharge impacts and the promulgation of guidelines only to aspects of potential ocean degradation that (1) are not already addressed under Section 402, and (2) are reasonably likely to occur from the type of operation for which a permit is sought. If projects are subject to an EIS requirement, any Section 403 determination should rely on EIS data and analyses and should not require redundant analyses.

Restoration of Natural Resources

Make the penalty apply to real water degradation. Section 311 of the Clean Water Act should be amended to require that no penalty be assessed until spills of oil or hazardous substances are proven harmful to the environment. When penalties are assessed, the restorative process of nature should be taken into account. Spills that occur in artificial impoundments, from which a discharge is covered by a NPDES permit, should be exempt from the penalty provision.

Agricultural Stormwater Discharges

The definitions of point source in Section 502(14) should be amended to exclude all agricultural stormwater discharges. Existing authority and support should be continued for state and local programs (under Section 208 of the Clean Water Act) to control nonpoint source pollution which is identified as a water quality problem in local areas.

Intermittent Streams

Congress should amend the Clean Water Act to make it clear that, except in limited instances, states should not apply water-quality-based standards to streams having only intermittent natural flow. States should apply limits beyond technology-based effluent limitations to intermittent streams on a case-by-case basis *only* when there is significant environmental benefit from the added control.

Construction Grants Program

Maintain financial assistance at a level sufficient to assure the cleanup of water pollution from municipalities. The assistance program should assure that funds are spent on projects that will produce the greatest amount of water pollution cleanup and control. In order to assure that funds are spent effectively, the program should be reformed so that it requires more money to be spent on the construction of needed facilities and less money wasted on needless studies and paperwork which only cause delay, confusion, and inflated costs, and which deliver no benefit to the environment. Federal involvement should be limited to oversight and guidance, and EPA should permit states to set their own programs for administering financial assistance. ■

Congress Takes A Look At Clean Water Act Amendments

continued from page 1

Few members of Congress seem eager to enter a full-blown debate on the Clean Water Act at this stage of the election year.

However, regardless of when the action occurs, reauthorization of the Clean Water Act could be among some of Congress' most controversial debates.

The challenge of Congress is to deal with the implementation difficulties while preserving the basic intent of the Clean Water Act, to protect our nation's waters.

The challenge is to develop programs which effectively implement the law's intent and principles without frustrating the best efforts of both government and industry.

That balance served as the guiding principle as the members of the NEDA Clean Water Project examined the Clean Water Act and developed the recommendations and rationales contained in this publication. NEDA's suggestions are aimed at reducing the paperwork burden on industry and government, eliminating the regulatory maze which slows economic development, and facilitating compliance with environmental goals. ■

Chairman Haun Brings Extensive Experience to NEDA/WATER

J. William Haun, chairman of the NEDA/Water Project, brings to the coalition a variety of experience in both environmental affairs and policy coordinating.

As Vice President, Engineering Policy and Corporate Energy Coordinator, General Mills, Inc., Haun advises senior management on environmental compliance and on energy and resource conservation.

He has been involved in environmental activities since the late 1960s when he joined the Environmental Quality Committee of the National Association of Manufacturers. He later served as chairman of the committee and was also elected to the NAM Board of Directors.

Haun has testified before Congress more than 30 times on environmental matters and he has participated in numerous meetings with members of the EPA, Commerce and State Departments, and the Council on Environmental Quality.

As part of the International Working Group that founded the International Centre for Industry and Environment in 1973, Haun served as the group's chairman for two years. The function of the organization was to supervise the United Nations' environment program. ■

ABOUT THE NEDA CLEAN WATER PROJECT:

Sponsor

The Clean Water Project is a special undertaking of the National Environmental Development Association, a coalition of industry, labor, agriculture and other interests founded in 1973 as an advocate of balanced economic, energy and environmental development.

Origin

NEDA/WATER is the result of a meeting in June 1981 of leaders of a number of companies and labor unions concerned about the effects of federal clean water regulations on industrial development. J. William Haun, Vice President, Engineering Policy and Corporate Energy Coordinator for General Mills, Inc., serves as Project Chairman.

Goal

NEDA/WATER is an established forum for considering problems related to the Clean Water Act, involving government, industrial, labor, and environmental interests. Functional goal of the Project is to achieve legislative and regulatory changes which will ease Clean Water Act uncertainties and restrictions of concern to industry and labor without harming the nation's waters.

Focus

NEDA/WATER, through its Steering Committee and Technical Committee, identifies problems and suggests legislative and regulatory aims. Areas being explored are related to source permitting and technological compliance requirements.

Activities

NEDA/WATER functions through its committees and members in a range of efforts aimed at improved understanding of the issues and full participation by all concerned in the problem-solving process. A state outreach program identifies, informs, and cooperates with interested state and local organizations. A regulatory agency program seeks opportunities to document problems in the federal regulatory framework and to seek useful alternative structures. A congressional relations program offers a resource of information and perspectives of specific value to individual members of Congress. A communications program produces publications, speeches, news media materials, and other information on Clean Water Act issues.

Mr. ROE. Please proceed.

TESTIMONY OF WILLIAM HAUN, CHAIRMAN, NEDA CLEAN WATER PROJECT, AND VICE PRESIDENT, ENGINEERING POLICY, GENERAL MILLS, INC.; J. JEFFREY ZIMMERMAN, CHAIRMAN, NEDA/WATER'S TECHNICAL COMMITTEE, AND MANAGER, EXTERNAL AFFAIRS, HEALTH AND ENVIRONMENT, OCCIDENTAL PETROLEUM CORP.

Dr. HAUN. First I will say to you, Mr. Chairman, that I am accompanied by Mr. Jeff Zimmerman. Mr. Sheets had serious brain surgery about 5 or 6 weeks ago and is recuperating, but he just couldn't make the day here, and if you will permit me, I will summarize his statement.

Mr. ROE. If we keep this up, we are going to need the same treatment.

Dr. HAUN. If you will permit me, at the end of our presentation, I will summarize the Laborers' International statement.

Mr. ROE. Fine.

Dr. HAUN. I might say just before I begin the prepared remarks, I think that this committee deserves our thanks and appreciation for the way these hearings have been conducted and the patience that you have shown and your willingness to listen to all those who have something to say. This is not always our experience with committees of the Congress, and we want very much to thank you, Mr. Roe and Mr. Stangeland and members of your staff, for having set this up in this way.

Mr. ROE. Very fine.

Dr. HAUN. The NEDA clean water project is a coalition of industry, labor, agriculture and other interests seeking a balanced consideration of issues relating to the Clean Water Act. For your information, we have about 22 major corporations. We have the building trades department of the AFL-CIO and two agricultural organizations as the membership basically of our NEDA group. So that is the perspective from which we speak today.

Today we will present recommended changes to the act dealing with pretreatment, compliance deadlines, integrated facilities, permit life, de minimis exemptions, intermittent streams and construction grants. That could keep us all afternoon.

With your permission, we have submitted a prepared statement, and we would like to paraphrase and summarize the remainder of this statement.

We know you have received a tremendous amount of information in the past few weeks and rather than going into another treatise of information, we will briefly highlight our major concerns. Also we have tried to listen to the questions that you have been asking over the last couple of weeks at these hearings, and we are trying to incorporate some of those responses into the statement, itself.

Before we offer our recommendations for amendments to the act, I think we need to step back again and take a perspective look. This has already been suggested at today's hearings.

We need to focus our attention on where the problem is, and we have provided two charts which will be included with our formal statement, the first showing the present state of sources of major

pollutants in the country, from point sources, the dark part of those bars, and from nonpoint sources, the light gray portion of those bars.

That is 100 percent over the full size of the bar, and you can see in some cases that the point source category itself is quite small. That comes as no surprise to this committee.

The second chart, the lower one, chart B, we have taken the whole category of point sources, and we have isolated POTW's as opposed to nine major categories of industrial point sources and done the same sort of analysis. On this basis the POTW's then are the primary source of water pollutants in some classifications. In fact, the only one in which that is not necessarily true is dissolved heavy metals, and that is a problem which you have been addressing here rather rigorously this afternoon.

We bring this to the attention of the committee not to sidestep our responsibility as point source operators nor to point fingers of blame at others, but we think this perspective is important as the committee and Congress seek meaningful ways to increase the effectiveness of the Clean Water Act.

Basically, we are here today to offer recommendations which we think will speak to the act for clarification and simplification. That has been our objective since we formed the coalition nearly 3 years ago, and we are staying with that objective.

I would like to ask Mr. Jeffrey Zimmerman, who is chairman of the NEDA Technical Committee that has prepared most of the policy papers on which we have been operating, to give you a summary of our views on the major technical issues.

Mr. ZIMMERMAN. Mr. Chairman and members of the subcommittee, I would like to discuss a few of our recommendations for improvements in the act. I would like to concentrate this discussion on what I believe are the questions you have been asking during these hearings so far and try to give you our answers to some of those questions.

The first topic I would like to address is pretreatment. The NEDA water project supports pretreatment for industrial pollutants which are, one, not susceptible to treatment by POTW's and which, therefore, would pass into the water body untreated, two, interfere with the operation of treatment works or, three, interfere with the proper disposal of sludge. We do not take issue with the intent, but rather the implementation of the present pretreatment program and in particular the categorical standards.

Here is an example of the problems we face. Since 1981, an aluminum plant owned by one of our members has been discharging its waste into a local POTW. The waste contains a substantial amount of aluminum, in the form of soluble aluminum hydroxide.

The effect of this stream has been very closely studied. Not only has the discharged not had any negative effect on the POTW, it has actually improved the sludge settling and thickening performance. This has been achieved without any cost to the POTW.

Now under the Federal categorical pretreatment standards that aluminum plant will be required to remove the aluminum hydroxide from its waste before it sends it to the POTW. It will cost the plant a substantial amount of money and deprive the POTW of the treatment benefits it now obtains from that particular waste

stream. To get the treatment the POTW would have to buy the chemical and add it to its system.

Along with the categorical pretreatment standards program, Congress directed in 1977 that industry be given credit against the pretreatment requirements for pollutants that the POTW was capable of removing. You have already discussed to some extent the removal credits portion of the pretreatment program.

This simple, equitable, and efficiency-oriented notion has produced probably the major stumbling block in the implementation of the pretreatment program. The removal credits portion of EPA's regulations, in my opinion, defies comprehension. It occupies 11 double-columned, single-spaced pages of the Code of Federal Regulations just to state the formulas, conditions, and procedures and includes numerous cross-references to other sections and procedures that must be followed in order to make a removal credits application.

As you have heard, it is so burdensome that many local POTW's refuse to even consider trying to implement its provisions. You have to wonder whether this regulation was actually designed to prevent anyone from ever being able to satisfy its requirements. I would be happy to discuss, if you would like, some of the problems we see with the removal credits portions of the regulations.

We recommend that the act be changed to allow qualified local POTW's to establish their own pretreatment programs. We do not advocate scrapping the Federal program, although it certainly could be improved. That program would remain in effect unless the POTW successfully qualifies to implement its own program.

Let me quote, if I might, with your indulgence, some of the findings of this committee during its oversight and investigations hearings on the Clean Water Act some 2 or 3 years ago.

As stated by the Subcommittee on Oversight and Investigations, "It is obvious to the subcommittee, that a more reasonable approach for implementing a pretreatment program is absolutely necessary. The simple fact is that both the current and original approaches have not worked and are not likely to unless changes are made. The primary concern for the pretreatment program should be the quality of the water that is discharged into the municipal works.

"So long as a municipal treatment plant can meet its permit requirements, there is no rationale for Federal meddling in local decisions as to how this should be accomplished." That is what we are here to endorse.

How would we measure whether the results are at least as good as the Federal program? I think this is one of the questions you have been asking over these hearings. Well, we think there are several methods. One would be to measure the effluent at the end of the POTW pipe to see if it is as good as it would have been under the Federal program. Another is to measure against water quality standards in the receiving water and another is to study the effects of the effluent on biota in the receiving waters.

Under the Federal program, the only tests are those by the POTW to show compliance with its permit limits. The Federal pretreatment program simply requires that a company install technology necessary to meet the categorical standards. The program does

not measure the effects on the water body after such pretreatment and treatment by the POTW. Our recommended change goes a step beyond what the Federal Government would require.

Would such an approach reduce protection of human health is another very important question that I believe this committee has been asking. Not at all. In fact, the Federal program as it is now structured addresses control technology only, not the effect on the water body or human health. Our approach would take us a step closer to knowing these effects.

Let me shift now to the subject of compliance deadlines. It is generally understood that there is a serious problem in complying with the BAT and BCT compliance deadlines as set forth in the act. Simply stated, industry can't comply with requirements until it knows what those requirements are and has a reasonable time to translate numerical limits into installed and properly operating control equipment.

The present deadline and EPA schedule for promulgation of the BAT, BCT and pretreatment standards will not provide a reasonable time for most industries. We propose that dischargers be given 3 years to comply with BAT or BCT requirements after EPA issues the applicable final effluent guidelines.

Some proposals take this approach but also incorporate a closing date. However, the schedule of EPA for promulgating effluent guidelines has once again slipped and if July 1, 1987 is the deadline, there are already several industries which will have less than 36 months in which to comply with BAT, BCT and pretreatment standards.

If this committee is leaning in the direction of a fixed deadline, we urge you to set a reasonable period of time in which industry can comply with requirements or, once again, we will be back here asking for another extension.

A parallel problem is what we call integrated facilities. These are dischargers subject to more than one guideline, particularly those required to pretreat their waste. An example from our membership is a plant which contains six manufacturing buildings on 1800 acres. All the water is treated at one facility before it is sent to the POTW. In all, there are 60 regulated processes with over 30 miles of wastewater pipe and a flow of 6 to 7 million gallons per day.

This plant is subject to six pretreatment categories. Four have been promulgated, one has been proposed but not promulgated in final form, and one has yet to be proposed. Until all the standards are known, this plant will not be able to calculate what the ultimate limitations for its pretreatment system will be. In the meantime, the clock is ticking on those standards which have already been issued.

This same type of situation occurs to one degree or another for our membership in over 100 plants in 35 States. The solution is to set a single compliance deadline requiring integrated facilities to be in compliance with effluent guidelines or pretreatment standards within 3 years from the time the last applicable standard is promulgated.

The next area I would like to discuss is the permit program——

Mr. ROE. Will you hold on that point.

20-955 O—84——162

What you are fundamentally saying is if we have multiple operations that are related to different guideline standards that what would be the common sense of putting in one system to do one thing and then when you get the new guidelines 6 months later, you put another set of equipment in, and so forth and so on; it doesn't give you a chance to plan and pretreat it. We may be able to do that and benefit from one element that is involved with the other.

So basically what you are saying is there is a facility that has a multiple effluent line, if you like, which is not all in the same category and guidelines that are just economically unsound. You put one system in it and you have to add another one later on for another set of guidelines. That is basically what you are saying?

Mr. ZIMMERMAN. That is right, Mr. Chairman.

The system is such that when EPA puts out these pretreatment standards, it has to look at the industry across the country, all of the various sources. Now we are seeing where you have an integrated facility, you may have the same pollutant in five different subcategories and you may have a different number come out of the national standards for each one of those five different categories for the same pollutant.

Dr. HAUN. It is not only poor public policy, Mr. Chairman, it is lousy engineering.

Mr. STANGELAND. I have a question that relates to that same thing. Yesterday this panel may have received the impression that industries which are integrated facilities have known what some of these pretreatment standards are and they have chosen not to do anything, claiming that they were special cases.

Do you have any comment on that?

Mr. ZIMMERMAN. Yes, I do. I anticipated that this might be asked. Neither of us here is an expert in the integrated facilities question, and I would suggest that we could provide you with a more detailed answer to that question in writing.

[The following was received from Dr. Haun:]

NEDA
CLEAN WATER PROJECT

National Environmental Development Association • 605 Fourteenth Street NW, Washington DC 20005 • 202 638-1230

J. WILLIAM HAUN, Project Chairman

January 17, 1984

The Honorable Robert A. Roe
Chairman
Water Resources Subcommittee
Committee on Public Works and Transportation
House of Representatives
Washington, DC 20515

Dear Mr. Chairman:

On November 10, 1983 the NEDA Clean Water Project testified before the Water Resources Subcommittee and recommended a number of changes to the Clean Water Act that would make the Act more effective without weakening its substance and goals.

One of the issues addressed was "Integrated Facilities" -- a special problem of facilities that are subject to more than one categorical pretreatment standard. In our testimony we talked about the many problems of just one of our members' facilities where 6 pretreatment standards apply.

You asked for additional information with regard to the problems that integrated facilities face. Attached is that report.

The report makes these points:

- Integrated facilities are treated inequitably under the present law. The multiple deadlines which these facilities are subject to can result in the initial construction of a treatment plant which later is either inadequate, necessitating upgrading, or overdesigned, resulting in excess treatment capacity and wasted resources. Allowing these facilities to comply with these standards -- without altering the standards -- three years from the issuance of the last applicable guideline would solve the problem.

- The Combined Waste Stream Formula, which EPA holds out as the solution to this problem, is flawed and unworkable.

- The courts have taken away the last avenue of relief that had been open to integrated facilities whose discharges are fundamentally different from those studied by EPA. In 6 months, industrial users of POTWs will first become liable for

violations of pretreatment standards and will later be exposed to new liabilities each time the compliance date for a different categorical standard passes.

The point we want to emphasize is that integrated facilities do not need relief from pretreatment standards. Rather they need adequate time to plan, design, install, and start up treatment facilities after all the final pretreatment standards applicable to the plant are known.

If you should have any questions about this report, please do not hesitate to contact us. If possible we would request that this report be attached to the hearings formal record.

Thank you for your consideration.

Sincerely,

J. William Haun
Chairman

Integrated Facilities Report
Prepared by the
National Environmental Development Association's
Clean Water Project
for the
Subcommittee on Water Resources
Committee on Public Works and Transportation

Need for a Legislative Amendment

NEDA/Water believes that facilities subject to 2 or more categorical pretreatment standards are not being dealt with equitably under the Clean Water Act and the current general and categorical pretreatment standards. Good faith attempts by industry to seek administrative relief from inequity have been rejected. There is no reason to believe that subsequent attempts to seek timely relief will succeed. The courts recently invalidated the one avenue of relief that had been available to dischargers whose facilities are fundamentally different from those studied by EPA in developing category-by-category standards. In 6 months, industrial users of Publicly Owned Treatment Works (POTWs) will first become liable for knowing and willful violations of categorical pretreatment standards, and will be exposed to new liabilities each time the compliance date arrives for a different categorical standard.

A legislative amendment is required because "integrated facilities" need the opportunity and time to plan, design, install, and start up treatment facilities after they see final standards for all of the categories affecting them. That opportunity and time is available for facilities that are much simpler. It stands to reason that more complex facilities should have at least equal opportunity under law.

Report Summary

"Integrated facilities" refers to those industrial plants that are subject to more than one categorical pretreatment standard. These facilities generally have one wastewater treatment plant for all wastes generated in the plant. It is this one treatment facility which will need to be modified in order to comply with upcoming pretreatment requirements. These facilities are not being dealt with equitably under the Clean Water Act. Plants which fall into one industry category are subject to only one pretreatment standard. For these plants, a company can plan, design, and install treatment facilities one time after the pretreatment standard is promulgated.

The current Clean Water Act requires integrated facilities to meet more than one deadline for compliance, since more than one pretreatment standard will apply to these facilities. The problem is the lag time between the issuing of EPA's various pretreatment standards. EPA issues pretreatment standards one at a time, and the

compliance clock runs separately for each one. Since the compliance clock starts running at the time the first applicable pretreatment standard is issued, inte- grated facilities are faced with having to plan, design, and construct pretreatment systems far in advance of knowing all the standards they will ultimately have to meet. In many cases, it is physically impossible for integrated facilities to comply with sequentially issued pretreatment standards. In addition, substantial amounts of money will be misspent if the pretreatment facilities have to be redesigned each time a new standard is promulgated.

The enclosed report gives an example of how a plant subject to both electroplating and metal finishing would be adversely affected. The plant must meet electroplating pretreatment standards by June 1984 by installing added wastewater treatment capacity. The electroplating standards will be superceded by metal finishing standards in February 1986 which will require a total treatment capacity 46 percent smaller than that required under the 1984 electroplating standards. The result is that when the metal finishing standards take effect in 1986, the company will be left with excess treatment capacity which had been installed in 1984 to meet electroplating standards.

A related but separate issue involves the the so-called Combined Waste Stream Formula (CWSF). EPA has taken the position that a legislative amendment is not necessary because the CWSF is universally applicable and workable for all integrated facilities. This formula in theory is designed to recognize that many industrial facilities combine their waste streams prior to sending them to a POTW.

However, the CWSF is not workable for many integrated facilities for two important reasons. First, it still requires all pretreatment standards to be promulgated so they can be used in the formula. For those facilities whose pretreatment standards are not promulgated or even proposed, the formula is useless. Second, EPA has not completed rulemaking and has not corrected past rulemakings on the CWSF. Even if all the pretreatment standards are known, there are a number of technical problems with the CWSF which remain to be resolved. The result is that the CWSF is unworkable because necessary inputs are not currently available and are not likely to be available in time to make it useful for integrated facilities. In the meantime, the compliance clock continues to tick.

The courts recently invalidated the one avenue of relief that had been available to dischargers whose facilities are fundamentally different from those studied by EPA in developing category-by-category standards and who could not use the CWSF. EPA in its rulemakings had viewed the so-called Fundamentally Different Factors (FDF) variance provision of the Clean Water Act as an integral part

of this regulatory program for integrated facilities under the pretreatment regulations. Facilities which could not make use of the combined waste stream formula could seek relief under the FDF variance mechanism.

As a result of the court ruling, in 6 months industrial users of POTWs will first become liable for knowing and willful violations of categorical pretreatment standards, and will be exposed to new liabilities each time a compliance deadline for a different categorical standard passes.

INTEGRATED FACILITIES REPORT
NEDA Clean Water Project

Effect of Sequentially-Issued Standards
On Cost-Effective Compliance

The issuance of categorical pretreatment standards with sequential compliance dates can create peculiar and disadvantageous situations for industrial users of POTWs. Such situations can waste resources and promote only trivial benefits to the environment.

Example A (attached) is a case in point. The facility, a real and major facility, must first comply with electroplating pretreatment standards in 6/84 and then with metal finishing pretreatment standards in 2/86. Oddly, EPA has decided that the electroplating category will be subsumed by the metal finishing category in 2/86, thereby establishing a commonality of wastewaters from the 2 categories that does not exist in the real world. The result is that under the current law with separate compliance deadlines, this facility will build a larger treatment plant than it would if the compliance deadline were combined.

The Combined Waste Stream Formula is not Workable
for a Large Portion of Industry

EPA has taken the position that a legislative amendment is not necessary because the Combined Waste Stream Formula (CWSF) is universally applicable and workable for all integrated facilities.

The formula, shown below, was developed in 1981 in recognition of the fact that many industrial users of POTWs combine their waste streams prior to sending them to a POTW. It was intended to enable the industrial user to calulate an "end-of-pipe" pretreatment standard when the facility was subject to 2 or more categorical pretreatment standards. The end-of-pipe standard would serve as the basis for designing and installing appropriate treatment.

The formula is not workable for a large number of integrated facilities because EPA has not completed new rulemaking and has not corrected past rulemaking that is no longer valid. Following are specific problems with this formula:

a. Pretreatment standards are not available for several industry categories because EPA has neither proposed nor promulgated them. Examples of standards yet to be issued are Metal Molding and Casting, Organic Chemicals & Plastics and Synthetics, Nonferrous Metals (both phases), Plastics Molding and Forming, and NonFerrous Metals Forming (Phase 2). The Agency will not issue all of these standards until some time

in 1985. So at the first instance, the formula is unworkable because not all the pretreatment standard inputs are known.

b. The point at which a waste stream becomes "regulated" has not been defined by EPA. Does a waste stream become regulated upon the date of promulgation or on the compliance date of the pretreatment standard? Until EPA defines a "regulated" stream the formula cannot be used.

c. The definition of flow rate for dilute streams, issued in 1981, is totally incorrect but has not been corrected by a regulatory amendment. That definition, included in the rules governing the CWSF (403.6(e)), references an Appendix D that EPA acknowledges to be useless. The definition must be known with certainty if the CWSF is to be of any value.

d. The definition of "unregulated" waste stream does not exist. Unregulated waste streams are an integral part of the formula and must be known with certainty if the CWSF is to be of any value. The difference between dilute streams and unregulated streams is critical because the ability of a discharger to comply is more sensitive to the dilute/unregulated designation than to the categorical standards. Example B (attached shows that such a distinction makes a difference between compliance and noncompliance with the law.)

Also, it is not clear whether a waste stream targeted for regulation but not yet regulated should be treated as part of an unregulated stream in the formula. Again, EPA has provided no guidance.

e. EPA has proposed to amend the general pretreatment regulations to make the distinction between dilute and unregulated streams somewhat discretionary (48 FR 46956, October 14, 1983). The formula cannot be used now until final action has been taken on that proposal. If dilute unregulated determinations are made discretionary, how can EPA retain the CWSF as a rigid formula?

f. Flow rate may not be available for many waste streams generated in a factory because of the piping configuration. It is impossible to measure (or even make a reasonable estimate) of the flow rate of a waste stream if the pipes conducting that stream are not accessible. This is a particular problem if the regulated streams are numerous and all have different pretreatment standards, as in the copper forming category (see Example C).

g. Some pretreatment standards are expressed in mass units and some in concentration units. EPA has issued no guidance on calculating an equivalent concentration limit using a single formula when the combined waste stream contains one or more of each type of standard.

In addition, we question whether the pretreatment standard for a production-based mass-limit stream changes each time the production level changes.

Conclusion

Total flow rate is the only item in the combined waste stream formula that to date has been defined in sufficient detail for use in a rigid compliance formula across the broad range of integrated facilities in industry. The current CWSF is unworkable because the necessary inputs are not yet available and are not likely to be in time to make it useful for integrated facilities.

EXAMPLE A

NON-COST-EFFECTIVE TREATMENT WITH MINIMAL BENEFIT TO THE ENVIRONMENT

One major facility generates both electroplating (EP) and metal finishing (MF) wastewaters, which are currently regulated under 2 different categorical pretreatment standards. The electroplating compliance deadline is 6/84 and the metal finishing compliance deadline is 2/86.

- Status

Currently, the manufacturing plant generates the following gallons per day of electroplating and metal finishing wastes. The plant does not yet meet electroplating pretreatment standards.

```
51,900 GPD (EP)---->|
                    |  Combined
                    |  Waste (CWS)
20,400 GPD (EP)---->|  Stream      ---------> To POTW
                    |  250,700 GPD
178,400 GPD (MF)--->|
```

- Planned to Meet 6/84 Electroplating Deadline

In order to meet the 6/84 electroplating pretreatment standard deadline, a new pretreatment plant with design capacity A is installed.

```
51,900 GPD (EP)---->[New Treatment Plant Capacity A]->|
                                                      |
20,400 GPD (EP)---->No Treatment Required->           |   CWS
                                                      |  250,700 GPD ---> To
178,400 GPD (MF)--->Not Yet Regulated--->             |                   POTW
```

- Projected Need to Meet 2/86 Deadline

The treatment plant constructed to meet electroplating standards in 6/84 would enable the facility to comply with 2/86 metal finishing pretreatment standards. However, a treatment plant of design capacity B would be adequate. Design capacity B would be approximately half the size of capacity A (the treatment plant already installed to comply with electroplating requirements). The result is that in 1986, the facility will have unneeded, surplus treatment capacity due to the sequential deadline imposed under the current law.

```
27,900 GPD (MF)*--->[Treatment Plant Capacity B]--->|
                                                    |-> 51,900
24,000 GPD (MP)*--->No Treatment Required--->       |    GPD
                                                    |     |
                                                    |     v
20,400 GPD (MP)*--->No Treatment Required--->       |   CWS
                                                    |  250,700 GPD ---> To
178,400 GPD (MP)--->No Treatment Required--->       |                   POTW
```

* EP wastewater becomes MF wastewater in 2/86

GPD = Gallons Per Day
EP = Electroplating waste stream
MF = Metal finishing waste stream
CWS = Combined waste stream

Net Impact

Because of the sequential compliance dates and the nature of the waste streams eventually co-regulated under the Metal Finishing Category, this facility is being forced to install a treatment plant that:

- Will require an initial investment 52 percent greater than necessary to meet its long-range treatment needs.
- Will have 46 percent excess capacity (after 2/86) for the rest of its useful life.
- Will cost significantly more to maintain and operate because of its size.
- Will remove only an incremental 12 oz. of regulated metals per day from the waste wastewater discharged to the POTW. (After incidental removal by the POTW treatment plant, the incremental discharge of metals to surface waters will be negligible.)

EXAMPLE B

EFFECT OF DESIGNATING WASTEWATERS THAT ARE NOT REGULATED AS "DILUTE" VS. "UNREGULATED"

Following is an example of how designating a waste stream either "dilute" or "unregulated" affects compliance. The example compares zinc concentrations under each approach. A facility discharges a combined waste stream to a POTW that consists of porcelain enameling wastewater and a waste stream not scheduled for regulation under a categorical pretreatment standard. The flow rates are:

Porcelain Enameling Wastewater 50,000 Gal./Day	→	70,000 Gal./Day Combined Stream To POTW (A)	(Actual Zinc Concentration is 0.51 mg/l)
Other Wastewater Stream 20,000 Gal./Day	→		

- What is the compliance limit for zinc at Point A if the other wastewater stream is designated "unregulated"?

$$C_E = (0.56)\left(\frac{70{,}000 - 0}{70{,}000}\right) = 0.56 \text{ MG/L}$$ (facility in compliance)

- What is the compliance limit for zinc at Point A if the other wastewater stream is considered "dilute"?

$$C_E = (0.56)\left(\frac{70{,}000 - 20{,}000}{70{,}000}\right) = 0.40 \text{ MG/L}$$ (facility not in compliance)

Conclusion

Designating a non-regulated waste stream as "dilute" instead of "unregulated" can make the facility noncompliant, even though the categorical standard applicable to the regulated stream and the actual concentration in the combined waste stream do not change.

NEDA/Water:0121W

EXAMPLE C

COPPER FORMING CATEGORY

17 waste streams that must be accessible and measurable to enable a copper forming facility to assess compliance with just one categorical pretreatment standard. An integrated copper forming facility would also have to measure many other regulated streams from other categories and calculate a pretreatment standard for the combined waste stream. This is done for each

Mr. ZIMMERMAN. But from what I understand of the testimony yesterday, the impression may have been given that some companies knew about the electroplating standards and were simply sitting there willfully ignoring the standards. I want to make it clear that the particular company that was referred to yesterday, General Motors, is not a member of our coalition. So as far as we know, our members will not have any problem meeting the electroplating standards.

But to get back to the point of whether industry was ignoring a standard when they knew it was out there, the events, the chronology of events, does not bear that out. The electroplating standards in question, the BAT and pretreatment standards, were promulgated at the end of 1980 or the beginning of 1981, somewhere in that timeframe, and they were then stayed by the administration because there was substantial question as to whether there was any good basis for them.

In particular, it stayed critical parts of the regulation, such as the removal credits portion, the combined waste stream formula, the definition of passthrough and the definition of interference, indefinitely while it was going through a rulemaking process on those particular parts of the regulation.

Now that decision was challenged by NRDC, and in July 1982, the court ruled that the agency had followed improper procedures in staying those portions of the regulation and directed that it be instituted retroactively to the point in time when they were stayed. That sort of put industry in a bad situation. They had lost 15 to 18 months from the time period to comply with the standards.

But the court also in that ruling allowed EPA to go forward and look at the substance of the regulations and decide whether there was a problem with the removal credits, et cetera, and make some proposed regulations on that. The agency did that, proposing last September revisions to the removal credits portion of the regulations, and I believe in October to the combined waste stream formula.

There has been a substantial amount of comment on those two proposals. There are severe defects with the removal credits proposal as you heard Mr. Schwartz addressing in quite accurate terms a few moments ago, and it is our understanding, although we haven't seen this finally, that EPA is probably going to drop the revision of the removal credits formula. That is perhaps unfortunate, but it is indicative of the problems in the removal credits formula that they can't seem to be able to figure out how to implement a national removal credits program even for a very limited set of nine pollutants, which is far from the total number of pollutants that they need to address in terms of removal credits.

Dr. HAUN. They have given us reason to believe that they are still struggling with the combined waste formula even though the court said the one they have is not arbitrary and capricious, but EPA said yes, but it is not sound technically either.

So they are still giving signals that they are working on this problem.

Mr. ZIMMERMAN. Now, what happened at that point in time, about this time last year, is the monitoring portions of the categorical pretreatment standards, the removal credits and the combined

waste treatment formula started to go into effect and industry started to collect the monitoring data, to make the submissions by June of 1983.

When GM made those submissions, they found the majority of their plants, the vast majority were already going to meet the standard—but 27 would not meet the standard, so they applied under the provisions that were then in effect for an FDF variance for those 27 plants in very detailed applications.

Now, 6 weeks ago or so, the third circuit ruled that the FDF variance EPA had in the regulations was illegal. So, GM was stuck with not having any place to go.

It could not use the FDF variance provision. Right now they are in a situation where some of their plants, as I understand it, may not be able to meet the standards by the deadline of 1984.

The second part that I would like to address is that you may have been left with the impression that the combined waste stream formula has been around for a long time, and that it is stable, and that there is no problem with it, by the testimony that you heard yesterday.

Well, it has undergone substantial changes. It has been proposed for revision. Further, that it is not quite as long as the removal credits portion of the regulation simply because they put in a lot of formulas in it.

It is, in my judgment about equally incomprehensible. The biggest problem we see with it, although you can, I suppose, run the calculations, is you have to know what all the pretreatment standards are going to be before you can make the calculations.

And with a lot of categories, you don't know at this time, what the pretreatment requirements are going to be. So, if you are an integrated facility where four of your standards are out there and two or three of them haven't been promulgated yet, you can't make the combined waste stream calculations. So you don't know what kind of treatment you are going to have to design.

We have also heard that there are substantial concerns about the compliance aspects of the combined waste stream formula. It is so difficult to run the formula and so uncertain as to what standard you get, that you are not going to be able to use it as an enforcement or compliance assurance mechanism.

If there are other questions on that portion of this discussion, I will be happy to answer them.

Let me go on with a few points briefly on the permit program. As you know, there are thousands of permits that are in a backlog situation. We understand the number is around 30,000 that have not been issued. Many organizations have testified that one effective means of rectifying the situation would be to change the permits from 5 years to 10 years.

This recommendation for 10-year permits is supported by the NEDA water project, but it has also raised issues of reopeners. We support the reopener provision in the current regulations. Beyond such provisions, if the EPA is concerned about the effect of changing cleanup requirements and its ability to reopen the conditions of the permit, it has the option to either issue the permit for a

shorter period of time or to propose changes to its reopener regulations. We urge you to extend the maximum permit life up to 10 years.

A closely related matter for us is the subject of de minimus exemptions to the permit program. The majority of the permits are for minor discharges. One illustration that we have is a case where a company's drinking fountain, because of its location, drains its overflow into a receiving water body.

That drinking fountain, believe it or not, requires an NPDES permit and there is no provision under which it can be exempted or otherwise permitted. The EPA Administrator should be allowed to exempt certain de minimus point sources and channeled storm water runoff which contains de minimus quantities of pollutants from the NPDES permit procedure.

The last point I would like to address is the subject of intermittent streams. In their water quality standards programs, many States have automatically extended the application of these standards beyond the point where the stream becomes intermittent.

In other words, to the point where there is no aquatic ecosystem present, because there is no continuous flow. This has been done without looking at the streams to find out whether there is something there to protect with the water quality standards. It will require facilities to install additional water pollution controls beyond BAT requirements on discharges into these dry streambeds where the effluent is the sole source of the streamflow.

Application of such control technologies is in many cases unnecessary because there is no ecosystem to protect, and therefore, we think it is a needless expense. Water quality standards, in our opinion, should only be applied to intermittent streams in cases where the Administrator or State determines it is necessary to protect aquatic life in the perennial stream or where the discharge from the point source has extended the stretch of the perennial stream so as to extend the ecosystem up to the point of discharge.

In those instances, we believe the water quality standards are properly applied, because you have an ecosystem to protect.

At this point, I would like to pass the microphone back to Dr. Haun to summarize the remarks Mr. Sheets would have made had he been able to be here.

Dr. HAUN. I have the honor to summarize the statement of Mr. Sheets of the Laborers' International Union, who, incidentally, Mr. Chairman, is my cochairman of the steering committee of this project, and has been a very active participant throughout.

As pointed out earlier in the testimony, one of the largest single sources of pollution in the country are municipal treatment plants. You have had testimony to the fact that many municipalities are not in compliance.

EPA estimates that by the year 2000, there will be a need for $118 billion for the construction of wastewater treatment plants. And the programs and congressional activities have only made a small dent in their entire program.

The inability of municipalities to meet their pollution control ob-

20-955 O—84——163

ligations creates very serious problems, not only with regard to the environment, but with regard to an area's economic health.

You have heard from others that nearly half of the Nation's communities are unable to add additional homes or businesses onto their sewage treatment systems, because they are already operating at full capacity. If a production facility is prohibited from locating in a particular site or expanding an existing facility because of inadequate municipal sewage treatment, municipalities could suffer the economic hardship of losing a major source of new jobs and tax revenues.

If, in order to offset pollution from municipal discharges, a producer is required to use more expensive controls to balance the effect of municipal waste, he might be forced to look for another site where pollution costs are more equitably shared.

Only adequate funding and legislative and program reforms will insure that dollars are spent productively to control the Nation's water pollution problems.

Reduction in funding to $2.4 billion a year doesn't mean the overall cost of municipal cleanup has gone down. In fact, if the reduction in funding has slowed the progress of the program, which is likely, the overall costs of the program is likely to rise as the stalled projects are hit with inflation.

Over the past few weeks, you have heard a variety of opinions about what to do about this problem. Opinions range from increasing Federal grants to allowing municipalities to develop their own source of funds.

There are innovative suggestions, such as privatization of POTW's, allowing Federal grants to be used for low-interest loans. We can't pass judgment on many of these suggestions.

Any or all of them may be workable. However, today we are faced with an ever-increasing need to get these plants up and running. The most immediate vehicle for getting funds in the hands of municipalities is the existing construction grants program.

Consequently, we support increased funding for this program. That concludes our summary, Mr. Chairman. We would be happy to answer whatever questions the committee would have.

Mr. ROE. I don't think the question that I would like to ask, I dare ask. Well, doesn't it boil down to the point of view, of course, a lot of the testimony is redundant, not your testimony, it is the implementation.

Congress writes the framework and they write the guidelines, what they are trying to achieve. In between, that is a body of decisionmakers, whatever. They pass that information to the people who have to implement them.

It seems to me that no matter how many times we have made midcourse corrections, most of them are disastrous, but the timeframe of putting into clear, concise direction what is to be done and charging those who are to implement, whether it be the public agencies or the private sector, it just, they haven't met the guidelines.

In candor, it is a fact. I don't know how, in God's name, you could sit and figure out what you are going to do with multistream waste, multiwaste stream, if you have only got part of the guide-

lines, then you have a deadline to do something by a date certain, which just doesn't fundamentally make any sense.

Dr. HAUN. Mr. Chairman?

Mr. ROE. When you look at the bill, some of the bills that are being projects, they are looking for post-BAT and we haven't even got pre-BAT done.

Is that unreasonable to say?

Mr. ZIMMERMAN. I think you have summarized it very well, Mr. Chairman. Sometimes, about every time I look into this situation, I feel like a rat who has been dropped into an interminable maze. At each point, every time I go around a corner, there is a black hole I can fall into or there is a brick wall.

Mr. ROE. Let me develop that further.

I think that what the committees have been attempting to do, was to say, well, OK, big government is in the way.

What we ought to be doing is let a lot more of these decisions be made at the local level. And therefore, you would have a much closer relationship to the people that were in the decisionmaking pattern, and they can make the decision better.

Except then they pull the rug out from under them, and take all the money away and say we will set the guidelines. We will set what broad achievements are supposed to be. But the local people will have to provide the funds to get it done, otherwise go to jail.

I don't mean to be facetious, but basically that is what is happening. It seems to me, do you think the local governing bodies and States could do a better job of getting the job done.

Mr. ZIMMERMAN. Well, in the pretreatment area, I think that is a very good point, and a point I should emphasize here is that in many instances, the local POTW's have very strong local pretreatment programs. Those are being met or we are on the way to meeting those.

That is where the control ought to be. But to try to get everybody to fit into these national uniform boxes and make commitments without funds, as you point out, to eliminate their combined sewer overflows when they have no money and no manpower to do that, to begin building POTW's and pretreatment plants when you don't know what the standards are in order for you to be able to apply for a credit to avoid having to apply the categorical pretreatment standards that you would ultimately have to apply, you have got to wonder whether anybody really wants us to implement an effective, combined stream treatment of industry, pretreating, and POTW's doing ultimate treatment.

The direct discharge is a lot easier in many instances for industry to meet. It is simple. You tell me a number. My engineering people can tell you whether we can meet it, tell you how long it is going to take us to get the designs done, the material installed and get it to work properly.

But when I have to be thrown into the abyss of the regulations on pretreatment, and I have got a moving target to shoot at, I don't know for what I am supposed to engineer.

Dr. HAUN. Mr. Chairman, may I comment just a few minutes on that?

Mr. ROE. Of course, Doctor.

Mr. HAUN. It seems to me that there is a tremendous lack of trust throughout these programs, of course. That has been a sort of given. I sat before you, among others, in 1971 and we talked about this.

Mr. ROE. I remembered you. You don't look any older than I do.

Dr. HAUN. But we tend to forget that from a municipal standpoint, wastewater treatment is a much older, much better established activity than, say, air pollution control or RCRA or any of these other new regulatory programs.

Our cities have been working at treating their wastewater for 100 years. We started training qualified sanitary engineers to work for municipalities in the early part of this century.

Most cities, at least large cities, now it is not true of small communities, but the large cities have very effective professional staffs. They know what they are doing and they know their systems extremely well, better than anybody in Washington will ever know it.

And so, if you look, at the Chicago ordinance, it is a model for the world. I have personally taken that ordinance to European countries and other places to illustrate that this is the way you can write a sewer ordinance that accomplishes the purposes and, at the same time, spreads the costs where they belong, and gets the job done.

Under the present situation, you have already heard, Chicago says we don't want any part of this program. If you want to put that on us, you do it. We don't want any part of it. That is symptomatic, I think, of what the difficulty is.

If you could name the 25 or 30 other major sewage treatment plants in the country, you would find the same level of professional skill and ability to run a program.

I think you do need a Federal program for maybe some of the small communities on the Red River in the north, for example, to give them advice and counsel and watch over them and show them how to run their plant.

Mr. ROE. Let's deal with that. What do we say to the city of New York, when they are dumping 4 or 5 hundred million gallons a day, and a goodly portion being raw material, in the Hudson and East Rivers, and so forth.

What do I say to the people?

For example, I try to get across to EPA 100 times, and to Members of Congress, there is no point in requiring pretreatment to Mr. Ranno, when he testified, to the plating industry in the city of Paterson, which is the oldest industrial city in America, if you are not going to correct the combined sewer issue.

It is just wasting of money. Now, there is one valuable thing that has come out of these hearings above and beyond the emotions and people griping and finding fault. And I don't fault them. That is what we are here for.

We are a forum.

Dr. HAUN. Sure.

Mr. ROE. But one thing that has come out of this that is a sticking point to me, the first time, is the order of magnitude of the re-

lated problems in the nonpoint source issue. And I think that that is a point that has to be developed in the public conscience.

But unless we deal with the other issues, we then are now at a point of wasting tax money. I am pleased to say the environmental organizations have listed that in their testimony almost completely, and said one thing that is not included in all the proposals presented, all the easy solutions to terribly frightfully complicated, technical issues, is that issue.

Then it seems to me, if we start to use that as the foundation and say, well, if we are going to do the next quantum jump, then we have got to deal with that relationship.

And where do we spend the money, where do we make our priority? Does that make sense to you?

Dr. HAUN. It is too complicated a question, I think right now, Mr. Chairman. I had a student at Clemson University write me a letter 2 or 3 weeks ago, starting a research program at the master's level on nonpoint source solutions.

She was asking for suggestions as to where she could go to get information to get started in this very complicated field.

I wrote her back and said the one thing I think she has to keep in mind and watch for is that every time one of these great regulatory programs gets close to the point where it touches the lives of millions of citizens, the administrators tend to draw back.

You have seen that in the Clean Air Act, transportation controls, where these programs, if taken literally, require you to begin to take control of it on behalf of millions of individual citizens.

This country isn't constructed that way. We don't have the means to do that. We have to find some way to solve the nonpoint source thing. We have got to get people to do this right, because they are right. Not because they are required by the law or because somebody in Washington says that is what they are supposed to do.

I personally think, and this is not only a NEDA statement at this point, that we have in place in principle, one of the greatest mechanisms for this in the world, for this, in the agricultural sector, and that is the agricultural extension system. It is the greatest technology transfer system that has been devised in the history of the world.

And they do a great job. If they could be convinced that they could find the funds and way to approach their people, I think you could begin to make a dent in the agricultural part of nonpoint.

On the urban part, that is another issue. As long as city managers can sit with people like me who want to come to their town and say, yes, my sewer system is overloaded, but I am not going to do anything about it until Washington gives me a grant, you know, and that is where it is left.

Mr. ROE. But if the gentleman would yield, you have got considerable experience, too. Don't forget, we are taking an extra few minutes, but it is worth it now. What you say is true. But this committee, people sitting here plus those on the floor and doing 10,000 other things they have to do in a day, it really isn't Washington speaking to the people in that sense, where Washington is controlling as some kind of a figment floating in the air, although I use

the same analogy when I speak of EPA and the bureaucracy myself.

We go back every day, practically, weekend, certainly, and we have to talk to the people who elect us. There are only 435 people who represent 220 million. But I am trying, hopefully we can hammer out this time. It would be very easy for this committee, as is wont in some instances to just take the public issue and say OK, fine.

We voted it out the best we can. Hear the philosophical things, and you guys go work out the details. But this committee has intensively studied this issue for years, as you know, based upon the point of view how will we make it work?

Then we come back and say, we don't want to change behavioral patterns. But we do know one thing, I think you would agree with this, unless we do something on the modern materials being converted into materials never known to mankind before, that are like a million times more lethal than what would have been found 100 years ago, when we started this sewer system, that is what we are doing.

When we get concerned about pretreatment, what are we going to do with mountains and hundreds of millions of tons of sludge?

Dr. HAUN. Right.

Mr. ROE. Many members have a bill going in now dumping it 130 miles out to sea. The other guy says we have the west coast. The east coast, the Continental Shelf, what do you do? Well, we know, in New Jersey, the second largest part of our economy is the tourist industry.

The more we defile, and they are now those beaches and so forth, we are losing out.

Dr. HAUN. Sure.

Mr. ROE. So I wonder what the citizen starts to think about. When we talk about $2.4 billion against a $200 billion deficit, a trillion-dollar economy, that is the saddest thing of all.

Dr. HAUN. Yes, on the other hand, if you compare it with some other decisions of choice, like, for example, the highway trust fund, which is in itself inadequate, but nonetheless a pretty big number compared to sewage treatment grants program, there is an infrastructure decision that has been made on a relative basis.

I don't know what—obviously, that is why you gentlemen were elected. I am relieved you have been elected.

Mr. ROE. We are going to fund at the level of $2.4 billion a year with $119 billion what we call, a program that is behind, there is no way we are going to solve the water pollution problems in the country. Is that a fair statement to make?

Dr. HAUN. I think it is a fair statement. I think the small businessmen of the country are going to be in very severe shape if we don't get municipal POTW's built.

Mr. ROE. We want to thank you very much for your patience and indulgence. Your testimony has been splendid. We appreciate it.

So, we have concluded our program for the day. This part of the

program for the day having to do with water pollution. Now, in the meantime, we will meet again next Tuesday at 9:30. Thank you very much, ladies and gentlemen.

[Whereupon, at 4:30 p.m., the subcommittee recessed, to reconvene at 9:30 a.m., Tuesday, November 15, 1983.].

POSSIBLE AMENDMENTS TO THE FEDERAL WATER POLLUTION CONTROL ACT

TUESDAY, NOVEMBER 15, 1983

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON WATER RESOURCES,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, D.C.

The subcommittee met, pursuant to call, at 9:30 a.m., in room 2247, Rayburn House Office Building, Hon. Robert A. Roe (chairman of the subcommittee) presiding.

Mr. ROE. The subcommittee will come to order in continuation of our Clean Water Act hearings.

We want to welcome as our first witness the Honorable Robert J. Mrazek from New York, our distinguished colleague. We thank you for being our opening witness this morning. We have your testimony. I know of your strong interest and hard work in the area of clean water as far as our Nation is concerned. We applaud you and appreciate your efforts on behalf of the Congress and committee.

For a welcome, I would also defer to the distinguished gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman. Today begins our final week of hearings on possible amendments to the Federal Water Pollution Control Act. We have already received extensive and knowledgeable testimony. While I don't say the best has been saved for last, there certainly is before us today an impressive series of witnesses. Today we have the opportunity to hear from representatives of both State and municipal water pollution control agencies as well as the Assistant Secretary of the Army, Mr. Gianelli, and the new Administrator of EPA, Mr. Ruckelshaus. Their efforts to maintain and improve the Nation's environment and well-being are fundamental to the entire quality of life we enjoy in this Nation.

There are many complex issues before us in the clean water area, including nonpoint source pollution, industrial pretreatment, dredge and fill permits, and water quality standards, just to name a few. While there are different views of how best to address these and other matters, it must always be kept in mind that we are all seeking the same goal, the maintenance and improvement of the quality of life in these United States.

The information we will receive from today's hearing, coupled with the other 12 days previously, will go a long way toward providing the framework within which a workable set of amendments can be developed. I look forward with you, Mr. Chairman, and the

other members of the subcommittee not only to receiving the testimony but to working together to fashion the best possible legislation in the tradition of the subcommittee.

Mr. ROE. Splendid. Now, if our colleague would proceed.

The full text your prepared statement will appear in the record at this point.

[Statement referred to follows:]

STATEMENT OF HON. ROBERT J. MRAZEK, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK, BEFORE THE WATER RESOURCES SUBCOMMITTEE OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION REGARDING PROPOSED CHANGES IN SECTION 404 OF THE CLEAN WATER ACT

Mr. Chairman, I would like to thank you and the other members of the subcommittee for allowing me to testify this morning. As a Member of Congress, I represent the north shore of Long Island, including a truly beautiful shoreline and many other valuable wetlands. It is therefore a special privilege for me to address my colleagues in regard to the protection of wetlands by section 404 of the Clean Water Act.

My interest in, and concern for the preservation of our Nation's wetlands does not stem from many years of experience as a Congressman. Quite to the contrary, I wouldn't think of matching my 10 months seniority with the many years of hard work, knowledge, and accomplishment of Chairman Bob Roe and my other distinguished friends who serve on this panel. Rather, I speak as a native Long Islander deeply concerned about our fragile environment. I feel compelled to speak up on the subject of wetlands preservation because of the extraordinary importance of Long Island's Bays and Harbors, its marshes, inland waterways, and coastal wetlands, to the quality of life of the people I represent.

For the vast majority of the residents of Long Island, careful regulation of dredge or fill activity in our waters is not a bothersome extension of federal authority, but a welcome control over commercial and residential development which might otherwise spoil much of the beauty, as well as many of the commercial and recreational benefits which 2½ million Long Islanders enjoy.

Section 404 regulation of dredge or fill activity is an essential tool in protecting water quality and groundwater recharge, both vital to Long Island's social and economic health and well-being. Long Island shellfish, Long Island duck, tourists who vacation at our resorts, along with the 2½ million residents rely on the physical, chemical, and biological integrity of our waters. Dredge or fill projects, which sometimes involve heavy metal concentrations, or toxic chemical deposits, must be governed effectively if the social and economic quality of life is to be maintained in the communities I represent on Long Island.

Before presenting my own proposals with regard to section 404, I would add my strong support to H.R. 3282, the Water Quality Renewal Act of 1983, introduced by Chairman Howard. With or without the additional amendments which I am proposing, the Howard bill reaffirms and strengthens our Nation's commitment to wetland preservation. Passage of H.R. 3282 will provide essential revision to those ambiguous provisions of the section 404 program, which have been used by the current administration to undermine some of the safeguards provided by Congress.

H.R. 3282 amends section 404 to reverse recent damaging regulatory changes and prevents future administrative weakening of the act. The Howard bill astutely keeps the burden of proof on the applicant by prohibiting the Corps from issuing any dredge or fill permit unless it determines that development will not have an unacceptably adverse effect on the aquatic environment and that there is no practicable alternative to the project which will have a less adverse effect.

Furthermore, H.R. 3282 would make interagency review of permits once again meaningful and equitable by reinstating the procedure that requires the Corps to allow the Environmental Protection Agency [EPA], Fish and Wildlife Service and other natural resource agencies to request further evaluation of controversial permits. Most importantly, Mr. Howard's bill removes the authority from the Assistant Secretary of the Army for Civil Works to veto requests by these agencies for referral of permit applications to a higher level of authority for review within the Corps. For these and other reasons, I appreciate and support Chairman Howard's bill reauthorizing the Clean Water Act.

Last week, Chairman Roe suggested that we take a "more gutsy and comprehensive approach" to the protection of wetlands. He correctly pointed out that to date, proposals regarding wetland protection simply seek to perfect the existing permit

program, without seeking to address the larger issue of promoting preservation. The chairman raised the possibility of providing financial incentives which would remove the profit motive in hapless or indiscriminate development of wetland areas. I applaud such insightful comments and I look forward to working with the subcommittee in breaking new ground and exploring new ways to preserve our precious natural resources. However, I am offering legislation which changes section 404 in ways which I admit does not break new ground. I am proposing changes which are consistent with the intent of Congress in establishing Section 404. These changes would complement rather than supplant Chairman Howard's bill.

The bill that I am introducing this week consists of three parts.

First, my bill would amend section 404(b) of the act to affirm the fundamental standards for environmental protection contained in the EPA guidelines issued in December 1980. Specifically, my amendment would expressly prohibit the establishment of a disposal site unless it can be demonstrated that the discharge of dredged or fill material at such site does not contain toxic pollutants, as other than "trace contaminants".

The term "toxic pollutants" includes, but is not limited to, the contaminants referred to in section 307(a)(1) of the Clean Water Act. These "toxic pollutants" are listed in table 1 of Committee Print numbered 95-30 of the Committee on Public Works and Transportation of the House of Representatives. This list is subject to revisions by the Administrator of the Environmental Protection Agency as authorized in the same section.

This amendment does not place an unreasonable burden on the applicant if there is no reasonable likelihood of a site being contaminated. Testing for toxic pollutants would only be required as part of the permit review process, if it cannot be determined with reasonable assurance that the discharge does not contain contaminants. This would be based on existing preliminary screening criteria in Section 230.50 B of the 404 guidelines.

As in the Howard bill, disposal sites would not be allowed in cases of adverse impact on the aquatic environment or in cases where a practicable (meaning among other things economic) alternative exists, which would have less adverse an effect. In addition, the provisions of my amendment expressly endorse and direct the continued application of the so called "water dependency" test. This guarantees that a search for practicable alternatives will be made prior to any discharge into a wetland. For example, construction of a marina must be completed adjacent to a body of water and is thus a "water dependent" project, whereas development of a shopping mall is not necessarily "water dependent". Incidentally, this allows for the possibility that social and economic conditions would justify a waterfront shopping mall.

The second part of my bill makes two changes in section 404(c). Currently, the EPA reviews whether or not a general or individual permit meets the criteria established by the program. The law requires the EPA to set the applicable standards for such permits as well as authorizing a review. The Agency is also given a veto power over such permits, but it does not require the EPA to impose its own rules!

Clearly, the intention of Congress in establishing section 404(c) was to give the EPA oversight responsibility to insure against adverse environmental effects from discharge of dredged or fill material in a wetland. The EPA is authorized to set guidelines, review each permit, and veto permits which don't comply. The EPA is also given authority to prohibit or limit the discharge of material in a wetland area where such activity would clearly have an unacceptably adverse affect on municipal water supplies, shellfish beds, fisheries, wildlife, or recreational areas.

However, the agency has been unable or unwilling to follow through and implement its own standards. Of the more than 100,000 permit applications processed since 1972, the EPA has only used its veto power once. My amendment makes it clear that the EPA must review permit applications as something more than a comment agency. The EPA would be required to block permits which do not meet the established specifications. There is no good reason why section 404 should have the EPA construct a system of standards and not be charged with the responsibility to implement them.

Again, I must emphasize that this change does not grant the EPA authority which it does not already have.

In comments on two of the July 22, 1982, nationwide permits issued, one allowing dredge or fill activities above headwaters and the other permitting activity to take place in isolated lakes and wetlands, the EPA objected on the basis that they were illegal violating section 404 E. Nevertheless, the EPA refused to use its veto authority. Why establish a system of rules if, as in this case, they are left unenforced?

It should also be noted that, if we are concerned about safeguarding sensitive wetlands from any intrusive actions, the amendment I am proposing would provide an excellent mechanism to secure this type of protection. If a wetland were targeted as a site for dredge or fill activities, the EPA would be required to veto specification of that site for any and all activities, assuming that such specification would have an unacceptably adverse impact on the environment.

Under the legislation I am introducing, the EPA would also be required to review petitions for exercise of its authority to limit or prohibit discharge in specified areas. While my bill would allow outside parties to petition, it also provides for a timely decision as to whether substantial information is offered. In this way, frivolous petitions would not be allowed to significantly delay processing of a permit. Only in cases where substantial information is provided with respect to municipal water supplies, shellfish beds, fisheries, wildlife, or recreational areas, would the petition process lead to formal consideration. A similar petition process involving substantial information was included as part of section 4 of the 1982 amendments to the Endangered Species Act. A strict time frame would also govern a decision on the merits of a petition containing substantial information.

This provision would allow interested and knowledegable parties such as municipal governments, a constructive way to provide new information to the EPA and prompt consideration when appropriate. If we are truly interested in enforcing realistic standards for protection of wetlands, the additional information provided in this way should assist the EPA in meeting its responsibilities.

The third and last amendment which I am proposing corrects what may well have been an oversight in section 505. This section of the Clean Water Act currently provides that any citizen may commence a civil action on his own behalf against the Administrator of the EPA regarding the enforcement of the Clean Water Act. This amendment would simply provide citizens with the very same right to judicial review with respect to the Army Corps implementation of section 404. The courts have already accepted cases involving section 404 and the Corps, but invariably such cases are delayed by the ambiguous right of parties to sue. Here again, I don't propose that we break any new ground, only that we make explicit what now is implied.

Mr. Chairman, members of the subcommittee, I offer these amendments to section 404 as constructive suggestions to improve implementation of this important program. Thank you for the chance to address this matter.

Mr. ROE. Please proceed.

TESTIMONY OF HON. ROBERT J. MRAZEK, A REPRESENTATIVE IN CONGRESS FROM THE STATE OF NEW YORK

Mr. MRAZEK. Thank you very much, Mr. Chairman. I would like to thank you for allowing me to testify this morning. As a Member of Congress I now represent most of the North Shore along Long Island. If you ever read the book "The Great Gatsby," my district sort of runs from West AG to East AG. It is a district where needless to say after 10 months in Congress I don't want to suggest to you that I have any tremendous insight into these questions on a Federal level. However, as a local official I have been involved for a number of years in trying to see that the North Shore of Long Island in particular is preserved for my children and the children of future generations.

It is fair to say that the wetlands on the North Shore of Long Island are in serious danger. I am compelled to speak up today on the subject of wetlands' preservation because of the extraordinary importance of Long Island's base and harbors, its marshes, inland waterways and coastal wetlands and to the quality of life of the people I represent.

For the vast majority of the residents of Long Island, careful regulation of dredge or fill activity in our waters is not a bothersome extension of Federal authority, but a welcome control over commercial and residential development which might otherwise spoil

much of the beauty, as well as many of the commercial and recreational benefits which 2.5 million Long Islanders enjoy.

Section 404 regulation of dredge or fill activity is an essential tool in protecting water quality and ground water recharge, both vital to Long Island's social and economic health and well-being. Long Island shellfish, Long Island duck, tourists who vacation at our resorts, along with the 2.5 million residents who presently live there rely on the physical, chemical, and biological integrity of our waters. Dredge or fill projects, which sometimes involve heavy metal concentrations, or toxic chemical deposits, must be governed effectively if the social and economic quality of life is to be maintained in the communities I represent on Long Island.

Before presenting my own proposals with regard to section 404, I would add my strong support to H.R. 3282, the Water Quality Renewal Act of 1983, introduced by Chairman Howard. With or without the additional amendments which I am proposing, the Howard bill reaffirms and strengthens our Nation's commitment to wetland preservation. Passage of H.R. 3282 will provide essential revision to those ambiguous provisions of the section 404 program, which have been used by the current administration to undermine some of the safeguards provided by Congress.

H.R. 3282 amends section 404 to reverse recent damaging regulatory changes and prevents future administrative weakening of the act. The Howard bill astutely keeps the burden of proof on the applicant by prohibiting the corps from issuing any dredge or fill permit unless it determines that development will not have an unacceptably adverse effect on the aquatic environment and that there is no practicable alternative to the project which will have a less adverse effect.

Furthermore, H.R. 3282 would make interagency review of permits once again meaningful and equitable by reinstating the procedure that requires the corps to allow the Environmental Protection Agency [EPA], Fish and Wildlife Service, and other natural resource agencies to request further evaluation of controversial permits. Most importantly, Mr. Howard's bill removes the authority from the Assistant Secretary of the Army for Civil Works to veto requests by these agencies for referral of permit applications to a higher level of authority for review within the corps. For these and other reasons, I appreciate and support Chairman Howard's bill reauthorizing the Clean Water Act.

Last week, Chairman Roe suggested that we take a more gutsy and comprehensive approach to the protection of wetlands. He correctly pointed out that to date, proposals regarding wetland protection simply seek to perfect the existing permit program, without seeking to address the larger issue of promoting preservation. The chairman raised the possibility of providing financial incentives which would remove the profit motive in hapless or indiscriminate development of wetland areas.

I applaud such insightful comments and I look forward to working with the subcommittee in breaking new ground and exploring new ways to preserve our precious natural resources. However, I am offering legislation which changes section 404 in ways which I admit does not break new ground. I am simply proposing changes which are consistent with the intent of Congress in establishing

section 404. These changes would complement rather than supplant Chairman Howard's bill.

The bill that I am introducing this week consists of three parts. First, my bill would amend section 404(b) of the act to affirm the fundamental standards for environmental protection contained in the EPA guidelines issued in December 1980. Specifically, my amendment would expressly prohibit the establishment of a disposal site unless it can be demonstrated that the discharge of dredged or fill material at such site does not contain toxic pollutants, as other than trace contaminants.

The term "toxic pollutants" includes, but is not limited to, the contaminants referred to in section 307(a)(1) of the Clean Water Act. These toxic pollutants are listed in table 1 of committee print No. 95-30 of the Committee on Public Works and Transportation of the House of Representatives. This list is subject to revisions by the Administrator of the Environmental Protection Agency as authorized in the same section.

This amendment does not place an unreasonable burden on the applicant if there is no reasonable likelihood of a site being contaminated. Testing for toxic pollutants would only be required as part of the permit review process, if it cannot be determined with reasonable assurance that the discharge does not contain contaminants. This would be based on existing preliminary screening criteria in section 230.50(b) of the 404 guidelines.

As in the Howard bill, disposal sites would not be allowed in cases of adverse impact on the aquatic environment or in cases where a practicable, meaning among other things economic, alternative exists, which would have less adverse an effect. In addition, the provisions of my amendment expressly endorse and direct the continued application of the so-called water dependency test that came in as a regulation during the Carter administration and which has been changed administratively. This guarantees that a search for practicable alternative will be made prior to any discharge into a wetland. For example, construction of a marina must be completed adjacent to a body of water and is thus a water dependent project, whereas development of a shopping mall is not necessarily water dependent. Incidentally, this allows for the possibility that social and economic conditions would justify a waterfront shopping mall.

The second part of my bill makes two changes in section 404(c). Currently, the EPA reviews whether or not a general or individual permit meets the criteria established by the program. The law requires the EPA to set the applicable standards for such permits as well as authorizing a review. The agency is also given a veto power over such permits, but it does not require the EPA to impose its own rules.

Clearly, the intention of Congress in establishing section 404(c) was to give the EPA oversight responsibility to insure against adverse environmental effects from discharge of dredged or fill material in a wetland. The EPA is authorized to set the guidelines, review each permit, and veto permits which don't comply. The EPA is also given authority to prohibit or limit the discharge of material in a wetland area where such activity would clearly have an unacceptably adverse impact.

However, the agency has been unable or unwilling to follow through and implement its own standards. Of the more than 100,000 permit applications processed since 1972, the EPA has only used its veto power once. My amendment makes it clear that the EPA must review permit applications as something more than a comment agency. The EPA would be required to block permits which do not meet the established specifications. There is no good reason why section 404 should have the EPA construct a system of standards and then not be charged with the responsibility to implement them.

Again, I must emphasize that this change does not grant the EPA authority that it does not already have.

In comments on two of the July 22, 1982, permits that were issued, one allowing dredge or fill activities above headwaters and the other permitting activity to take place in isolated lakes and wetlands, the EPA objected on the basis that they were illegal, violating section 404(e). Nevertheless, the EPA refused to use its veto authority. Why do we establish a system of rules if, as in this case, they are left unenforced?

It should also be noted that, if we are concerned about safeguarding sensitive wetlands from any intrusive actions, the amendment I am proposing would provide an excellent mechanism to secure this type of protection. If a wetland were targeted as a site for dredge or fill activities, the EPA would be required to veto specification of that site for any and all activities, assuming that such specification would have an unacceptably adverse impact on the environment.

Under the legislation I am introducing, the EPA would also be required to review petitions for exercise of its authority to limit or prohibit discharge in specified areas. While my bill would allow outside parties to petition, it also provides for a timely decision as to whether substantial information is offered. In other words, since there are many cases that might be considered frivolous, if not brought by people who are in fact demonstrating serious intention to prove that there would be an adverse impact, the EPA would have 30 days to determine whether in fact that kind of substantial information is provided.

They would make that decision within 30 days. If they decided substantial information was provided, they would have 90 days to make a determination on the merits of the case itself. Only in cases where substantial information is provided with respect to municipal water supplies, shellfish beds, fisheries, wildlife, or recreational areas, would the petition process lead to formal consideration. This is similar to the process already in use in amendments to the Endangered Species Act.

The provision would allow interested and knowledgeable parties such as municipal governments, a constructive way to provide new information to the EPA and prompt consideration when this is appropriate. If we are truly interested in enforcing realistic standards for protection of wetlands, the additional information provided in this way should assist the EPA in meeting its responsibilities.

Finally, the third and last amendment which I am proposing corrects what may well have been an oversight in section 505. This section of the Clean Water Act currently provides that any citizen may commence a civil action on his own behalf against the Admin-

istrator of the EPA regarding the enforcement of the Clean Water Act. This amendment would simply provide citizens with the very same right to judicial review with respect to the Army Corps implementation of section 404.

It adds the name of the Secretary, that being the Assistant Secretary of the Corps for Civil and Public Works, in the legislation itself. Here again we are not breaking any new ground but we are making the language a little more explicit.

I offer these amendments as constructive suggestion to hopefully improve implementation of this important program.

In conclusion, I would just like to again compliment you on the work that I know has taken a number of years for you to be committing yourself to. I am not trying to come along as someone who has only been here for 10 months in Congress and tell you that I have got some answers that you haven't already given, I am sure, serious consideration to. But I think they would strengthen some of the language we are working with in the bill.

Mr. ROE. Fine. Your testimony is splendid. I don't have any immediate questions.

The gentleman from Minnesota.

Mr. STANGELAND. No questions.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. No. I would just like to thank you for testifying today. These are important hearings, and we have been meeting for a long, long time on the subject and we appreciate your contribution.

Mr. MRAZEK. Thank you.

Mr. ROE. I think you have offered a strong contribution to three areas of your immediate concern that you have pinpointed, and by all means we are looking into this in depth. We are having a great deal of testimony on these issues, and I thank you for your contribution toward our efforts. Thank you very much.

Mr. MRAZEK. Thank you, Mr. Chairman.

Mr. ROE. Our next witness, representing Department of Army, is the Honorable William R. Gianelli, Assistant Secretary of the Army for Civil Works.

Mr. Secretary, welcome to our committee again. We haven't seen you for a while, but we know you have been busy on 10,000 other disasters throughout our Nation on natural resources and we appreciate your good work.

The gentleman from Minnesota.

Mr. STANGELAND. Thank you, Mr. Chairman. I would like to take a brief moment to greet Assistant Secretary of the Army Bill Gianelli. In his position in charge of the Corps of Engineers, he has worked tirelessly to move forward the system of water resources projects and improve the process involving permits for which the corps is responsible. His experience in water resources dates back to his service as head of California's water program under then Governor Reagan. I know that all of Mr. Gianelli's efforts have been aimed at the goal of achieving overall benefits to the quality of life in America and implementing programs which have too long languished in the morass of water policy conflicts.

One difficult area is section 404 of the Clean Water Act. The dredge and fill permit program in section 404 evokes strong feel-

ings on all sides. It is perceived by some as the salvation of wetlands and by others as the premier Federal infringement on property rights. I hope we can work toward proper policy despite all the strong feelings.

Mr. Chairman, you often accurately state that water is a part of the entire system and that quality and quantity are inexorably tied. That is one reason that I am very pleased that we have the opportunity to have Bill Gianelli here to provide an outstanding perspective on this relationship.

Mr. ROE. We also want to welcome General Wall and thank him for his great contributions he has been making to the water resources program of our Nation. You are accompanied by Mr. Rees, for the record.

Therefore, Mr. Secretary, if you would proceed we would appreciate it.

Mr. Gianelli, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

TESTIMONY OF HON. WILLIAM R. GIANELLI, ASSISTANT SECRETARY OF THE ARMY (CIVIL WORKS) BEFORE THE SUBCOMMITTEE ON WATER RESOURCES, COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION, HOUSE OF REPRESENTATIVES, NOVEMBER 15, 1983

Mr. Chairman, I am William R. Gianelli, Assistant Secretary of the Army for Civil Works. I appreciate this opportunity to discuss with you the status of our regulatory reform program to improve the effectiveness of section 404 of the Clean Water Act.

As you are well aware, this program has been very controversial from many different perspectives. Some people contend that the program was and still is overly burdensome. Some say we should become more involved with how people use their property and regulate more; and others say that what we have done so far is good, but we shouldn't make any further changes.

Mr. Chairman, I believe very strongly that administrative changes we have made to date have all been in the interests of good, efficient government and have not reduced the environmental protections contained in the Clean Water Act, the National Environmental Policy Act, and all the other environmental statutes which apply to this program. What we have done is eliminate or reduce unnecessary, duplicative, and wasteful procedures. We have left the substance of the program intact.

When President Reagan was campaigning before the election, he promised to get the Federal Government off the backs of the people. Soon after taking office, he established the Presidential Task Force on Regulatory Relief to help fulfill that pledge. In response to a general call from OMB for input to the regulatory reform process, the public identified the section 404 program as being in great need of reform. On May 7, 1982, after many months of deliberation, the Presidential Task Force issued directives for reforming the 404 program. These directives included measures to speed up the decisionmaking process, provide for greater use of general permits, reduce duplicative and overlapping procedures, give more authority and responsibility to the States, and clarify the scope of Clean Water Act jurisdiction.

Concurrently with the task force deliberations, the Corps of Engineers was reviewing and evaluating public comments responding to proposed rule changes which had been published in September 1980, before this administration took office. Based on that rulemaking process, we published interim final rules in July 1982. Those rules incorporated some of the task force directives to the extent that some of the reforms had already been proposed in the September 1980 package. Other reform decisions could be and were implemented administratively. For example, to speed processing time, we revised interagency coordination agreements to reduce a four-step, four-level decision review process to a one-level review process and we modified corps' in-house procedures to ensure that decisions are reached in the most timely fashion consistent with statutory requirements.

In order to fulfill all of the directives of the task force, we proposed additional regulatory changes which would enhance the role of the States, increase the use of general permits, and clarify the scope of jurisdiction of the Clean Water Act. Public

comments on those proposals are now being reviewed and we expect to develop final rules in the near future. We are also working, along with other agencies, on other regulations to reduce duplicative and overlapping procedures. These include NEPA implementation regulations, the guidelines under section 404(b)(1), and the cultural resources regulations.

The most perplexing area of reform to date has been the clarification of the scope of jurisdiction. We proposed a clarification on May 12, 1983, but the comments so far indicate that there is still a great deal of confusion and disagreement over the proper definition. We are working closely with EPA and hope to make progress on this issue in the near future.

We are involved in litigation concerning our July 1982 interim final regulations. We believe that some of the opposition to those regulations is based on a misunderstanding of how the program actually works. It is obvious that there are honest and reasonable disagreements over correct interpretation of statutory requirements, but we are hopeful that ongoing settlement discussions will be fruitful in overcoming these differences.

I would like to stress that the bottom line of our regulatory reforms to date is that we have maintained the environmental standards of the program while reducing the average permit processing time by 40 percent, reducing the backlog of applications awaiting action by 60 percent, and establishing for the first time in many years direct responsibility and accountability in the decisionmaking process.

Despite these improvements, we believe there is still substantial room for additional administrative efficiencies to reduce further unnecessary burdens on the government and on permit applicants by eliminating duplicative procedures, wasteful administrative practices, and nonproductive redtape.

Mr. Roe?

TESTIMONY OF HON. WILLIAM R. GIANELLI, ASSISTANT SECRETARY OF THE ARMY (CIVIL WORKS), ACCOMPANIED BY MAJ. GEN. JOHN F. WALL, DIRECTOR OF CIVIL WORKS, U.S. ARMY CORPS OF ENGINEERS; AND MORGAN REES

Mr. GIANELLI. Thank you, Mr. Chairman. I am delighted to be here today to talk about this very important subject of section 404. For the record let me introduce the people with me: Maj. Gen. John Wall, Director of Civil Works for the Corps of Engineers, on my right; and Mr. Morgan Rees, who heads the effort in the Assistant Secretary's Office with respect to regulatory reform. These people are both very knowledgeable and following my presentation will be available to assist in answering any questions which the committee might have.

Mr. Chairman, we have also prepared and sent to you a statement for the record, and I won't read that. But I would like to summarize briefly that statement plus some other observations I have.

Mr. ROE. Yes. Your statement has been entered in full in the record.

Mr. GIANELLI. Regulatory reform was an early goal of this administration. In 1981 the administration established an interagency task force to make recommendations to the Vice President who headed a Presidential task force on the subject of regulatory reform.

On May 7, 1982, after much deliberation the Presidential task force issued directives to the various Federal agencies in connection with the reform of section 404. Those directives included measures to speed up the process, provide for greater use of general permits, reduce duplicative and overlapping procedures, to give more authority of the responsibility to the States, and clarify the scope of Clean Water Act jurisdiction.

Concurrently we published interim rules in July 1982 in furtherance of a notice published back in September 1980. I might say that with respect to these interim final rules which were published in July 1982 we have been sued by a number of environmental organizations, and I will refer to that suit a little bit later.

In addition, in May of this year we published proposed final regulations to complete our effort with respect to the Corps of Engineers on the regulatory reform effort with respect to section 404. We have received a large number of comments with respect to the notice given on May 12 of this year. We have held public hearings and we will finalize in the not too distant future those proposed regulations taking into account earlier comments on the September 1980 regs and also any matters which might be included in the settlement of the litigation which I referred to briefly before.

At the same time we have in the last 2 years been working very closely with the Environmental Protection Agency particularly with respect to possible modifications of the 404(b)(1) guidelines. We are also working on NEPA implementing regulations, and we have been working also on a reexamination of the cultural resource regulations and a number of other activities which have to do at least indirectly with the 404 process.

Eventually, Mr. Chairman, we believe that legislation will be required in connection with the 404 program to clarify the intent of Congress. Now, about a year ago the Cabinet Council in looking at the possible amendments to the Clean Water Act decided we should go ahead and see what we could do with respect to administrative efforts on the reform of section 404. And following completion of that effort, we would come back and take a look at what else might be needed and make recommendations with respect to possible legislation.

We have not reached that point with respect to the administration yet, but I suspect that eventually down the line we will be coming forth with some recommendations we believe Congress should direct their attention to in connection with their efforts to look at the program, also. I think that there will be a number of issues on which the Congress will have to help us and will be addressing. Hopefully one of them I think has to be a recognition that originally section 404 was a part of the Clean Water Act and basically at least my perception is that it was given to the Corps of Engineers because of their vast experience with respect to section 10 of the 1899 Rivers and Harbors Act.

Section 10 of that act provides that you have to get a permit from the corps any time you want to place some sort of obstacle in the navigable waters of the United States. My reading of the act originally was that probably because of the administration of section 10 and because of some similarity with respect to section 404, the program was given to the Corps of Engineers to administer. But again, it had to do with the placing, having the corps issue permits with respect to placing dredge and fill material into the navigable waters of the United States.

By virtue of court decisions and administrative actions the definition of navigable waters has been extended very broadly and now my perception is at least that instead of talking about protecting the quality of the Nation's waters, we are talking about protecting

the Nation's wetlands. I don't object to that. I think that is one of the things that has happened in the evolution of the program. But it seems to me that Congress may want to go back and visit the program to see, for example, if it is to be a wetlands' protection measure, and if it really does the job.

I would respectfully suggest that there are many ways, for example, that wetlands can be destroyed other than through the use of dredge and fill material that require a corps permit. For example, you can clear an area, which happens extensively throughout the United States, which doesn't require a 404 permit. Yet it may destroy the wetlands. You can also drain the area. That doesn't require a 404 permit; that can destroy large numbers of wetland areas.

Another area, in talking to some of the people, for example, in Louisiana, there are large areas of coastal wetlands that are destroyed every year by erosion, natural erosion. This is obviously something the corps can't regulate under the section 404 program. So what I think I am suggesting, Mr. Chairman, as you look at the whole issue, that perhaps maybe your committee—I think it would be certainly appropriate, one go back and visit the original intent of section 404 of the Clean Water Act, which, as I read it, was to protect the quality of the Nation's waters. To now examine it in terms of what it is now perceived as being; that is, a wetlands' protection measure, and see, for example, if that still is the desire of Congress.

Also if it still is the desire that, for example, the Corps of Engineers administer this program, keeping in mind again that wetlands can be destroyed in a wide variety of ways that have nothing to do with section 404. Another thing, it seems to me, which I think the Congress will want to address is under the present law it seems to me it is sort of ambivalent as to who is in charge of the program. For example, the Corps of Engineers has the responsibility to administer the program, but as part of its administration of that program the corps has to apply, or has to comply with section 404(b)(1) guidelines of EPA.

In addition, of course, as has been pointed out by the prior witness, EPA has the veto power over any permit issued by the Corps of Engineers. Let me put it bluntly. Do you want the Corps of Engineers to administer the program, or do you want EPA to administer the program? If you want EPA to administer the program, maybe you ought to transfer the entire program to EPA and give them authority to look at the entire wetlands issue, not strictly the matter of fill material that require a corps 404 permit.

Another issue which I think the Congress will want to address is whether or not, if you decide that it should expand jurisdiction in connection with the wetlands issue, whether it is the desire of the Congress that the regulatory agencies get into the matter of land use, because that is basically what you start to talk about when you start to talk about protecting the wetlands.

Are you going to protect the wetlands and, for example, restrict the use or development on that land and usurp the authority of local interests? Or how is that going to phase in? I think that is another matter which certainly the Congress may want to consider. Let me also suggest, Mr. Chairman, it was my privilege to serve as

a member of the Rockefeller Commission that served from 1973 to 1976 on the review of the 1972 Clean Water Act. In my recollection of all the deliberations we had over the 3-year period of that commission on, for example, amendments that might be needed to the Clean Water Act, I can't remember any discussion at all with respect to section 404 as related to the subject of wetlands.

So again this ties in, I think, with what I said earlier, that perhaps the Congress may want to visit this program to see, for example, if the will of the Congress is being followed and if there is some need to reevaluate it.

I might also suggest that I think the corps and EPA and the other agencies have done well with respect to the administration of a very difficult program. I think the vast majority of the permits go through without controversy. But those that do go through with controversy, I think the Congress may want to hear, for example, from some of the applicants who have been subjected to all of the procedures that have been adopted and are in place with respect to the 404 program. For example, just to give you an up-to-date example. Last week ourselves, EPA, and Fish and Wildlife Service were summoned to a meeting called by Senator Warner. The purpose of the meeting was to discuss an application filed by the city of Chesapeake in Virginia for dredging out a channel to provide flood protection to its citizens. They produced a large number of maps which showed, for example, in the last year or so a large number of people in the area around Chesapeake being flooded by virtue of this natural channel which had been silted up and, in effect, would qualify as a wetland.

We, the corps, by virtue of the definition of wetlands, required a 404 permit. After he heard particularly from EPA and Fish and Wildlife Service, the district engineer determined that the public interest required the issuance of a permit so that that area could act to protect itself from a flood control problem. EPA and Fish and Wildlife Service objected and asked that the decision be elevated. A week ago, I denied the elevation again upholding the district engineer's decision, because it seemed to me that what was being proposed by the city of Chesapeake was to clean out this channel so the flood waters could escape. By virtue of that, the city would place the material which had dredged out of the channel along the banks, which were defined as a wetland area. Certainly this was not the original intent of Congress with respect to the 404 program.

The parties are all meeting and trying to work out that problem. I merely cite that as an example of something perhaps maybe the Congress might want to take a look. Congress might want to hear from a number of the applicants with respect to their perception of how the 404 program is working.

Let me as I close point out to the members, if I could, the process we have to use now with respect to considering a 404 permit. I have asked Leutenant Colonel Pernotte to put up on the wall for your examination what I call a simplified flowchart for the section 404 program. I would like to take a few minutes to refresh the committee's memory on how actually the program works. We have been looking at, as I say, the process for more than 2 years. I am convinced that the process now is much too complex and provides

too many opportunities for delays by those with single purpose concerns.

The corps, on the other hand, must balance the benefits and consequences of a proposal and judge whether the overall proposal is in the public interest. The long road which an applicant must follow is prescribed by a number of regulations, most predominantly the corps' own regulations. I should point out that over 50 percent of the 18,000 permit applicants each year are private citizens, and for brevity's sake I will only hit the highlights the regulatory process using these charts we have prepared. I might say we have an abbreviated version of that chart and will be pleased to make that available to members of the committee following the presentation.

First of all, if you start on the extreme left, when someone informs the corps that he or she wants to do something that may be in the waters of the United States, the corps or EPA must determine whether the site is within the program's jurisdiction. Then the corps determines whether the activity is regulated under section 404.

I should point out that only filling is regulated. Many activities which destroy wetlands are not regulated under 404.

Next, application for a permit is made by an applicant once we tell him that he is under the jurisdiction of section 404. He makes his application, a 30-day comment is provided and, if requested, a public hearing is held after another 30-day notice, as indicated by the colonel.

During this initial period there are a plethora of issues which can arise and lead to denial of the permit or extensive delays. Some are historic preservation, endangered species and coastal zone compliance. The corps must now apply the 404(b)1 guidelines through which the applicator must pass. These are duplicative. I must say we have had little success in reforming these guidelines. We were making pretty good progress up until about a year ago when personnel in EPA changed hands, and at the present time we still are working with the new team.

I want to point out that the new Administrator for Water at EPA has just been appointed within the last 2 weeks. I would say in the last year we have been somewhat handicapped by the lack of complete staff onboard at EPA. Moving on, the corps then prepares an environmental assessment which can lead to an environmental impact statement, which can take anywhere from 1 to 3 years to complete.

The corps next conducts its public interest review by evaluating the benefits and detriments of the project to determine whether the overall public interest is best served by issuing or denying the permit. Even if the permit is found to be in the public interest, there are ways a single-purpose agency can cause an application to be denied. For example, if EPA feels the project is environmentally unacceptable, regardless of its other merits such as flood control or energy development, they can invoke the lengthy veto procedures under 404(c). Also, if one of the resource agencies objects to issuance of the permit they may request elevation of the decision to a higher level under the section 404(q) agreements.

Let me stop at that point. Before we started the regulatory reform effort, the process was that the district engineer made the preliminary decision with respect to the 404 permit. If one or another of the Federal agencies, single-purpose agencies, EPA, Fish and Wildlife Service, National Marine Fishery Agency, did not like the decision of the district engineer, they could appeal that decision to the division engineer. If they still didn't like it, to the Chief of Engineers. If they still didn't like it, to the Assistant Secretary of the Army for Civil Works, my office. If they still didn't like that, to the Secretary of the Army. That process, just the elevation process could take a year to 2 years in terms of the delay in considering the permit.

Now, we have in the last year revised the memoranda of understanding with the other agencies so that now the district engineer is the primary decisionmaker. If the other agencies are not happy with the division engineer's decision, they can appeal directly to my office. There is one elevation. We make the decision whether the appeal should be granted, whether it should be denied and at what level it should be reviewed. So we have cut down very materially the processing time by virtue of reducing the elevation process which has been helpful, and as far as I know it has been carried out in the last year without any major problem.

Even if the project is found to be in the public interest, there are ways single-purpose agencies can cause an application to be denied. If EPA feels the project is environmentally unacceptable, as I pointed out, regardless of its other merits, such as flood control or energy development, they can invoke the lengthy veto procedures under 404(c). Also, if one or the other of the resource agencies object to the issuance of the permit, they may request elevation to a higher level under the section 404(q) agreements. That is what I just referred to a minute ago. The request is sent to my office where the merits of the request are evaluated and a decision is then made whether to have a higher level review. Even after this higher level review, EPA still exercise their 404(c) veto of the issuance of the permit.

As you can see, Mr. Chairman and members of the committee, this is a complex program which can be nearly impossible for a citizen to understand. The process has evolved over the years from a series of laws, regulations and policies subsequent to the enactment of the Clean Water Act. A citizen looking at this process must have great concerns about the wisdom of his or her government. When we came aboard it took an average of 128 days to get through the process. While we have made some improvements in the efficiency of the system, by moving through the steps more quickly, there is still far to go.

The basic problem, however, is the convoluted system shown in these charts. There are too many traps for an applicant to fall into if his project is controversial. I think there is too much control by other single-purpose agencies. It will take structural changes to devise a program which provides a citizen with a decision in a reasonably short time while still maintaining the needed environmental protections and the Congress may want to address these changes.

Mr. Chairman, members of the committee, that completes my presentation. If you have any questions, I would be pleased to try to respond to them now or be pleased to respond to them later in writing.

Thank you very much.

Mr. ROE. Well, I want to thank you very much, Mr. Secretary, for a very adroit and well-thought-out presentation, and I think a highly provocative one. I think your testimony has been splendid today, not in an argumentative point of view, but in portraying to the committee the labyrinth of processes involved in getting these matters resolved. So I think you have certainly presented an issue to the committee that has to be thoroughly reviewed because I think the point you are making basically is twofold.

One, that originally 404 had to do with dredge material and the effect upon navigable waters and, in effect, the water quality of the Nation. And as a whole series of additional laws have evolved affecting now primarily the wetlands issue we have a direct confrontation now on the economic development of the Nation as relates to our ports and harbors, inland waterways and dams and reservoirs and hydropower and to how that conflicts with the desire to be able to preserve the natural resources of the Nation.

I admire your testimony in the sense that you are bringing to the committee's attention the enormous complexities that are already there. And that has evolved into a confrontation, maybe not having meant to, but a confrontation between those who see the wetlands as being the paramount issue involved versus the point of view of the development of the Nation's resources. So I think you have brought that very, very clearly into focus.

Mr. Stangeland?

Mr. STANGELAND. Thank you, Mr. Chairman.

I join you in your discussion of the testimony. I think that simplified flow chart is an excellent example of what we have got and some of the problems, albeit well intentioned. I know that the administration hasn't sent up their package of 404 legislative amendments, but what are some of the areas you feel might require our attention?

Mr. GIANELLI. I think, Mr. Chairman, one of the big areas is the area subject to jurisdiction of the 404 program. I think I indicated that earlier. Originally as the chairman pointed out, it was a provision to protect the quality of the Nation's waters and I think by virtue of the court decisions and administrative actions, it is now viewed as a wetlands protection measure. It seems Congress might want to visit that issue and decide, if it is to be a wetlands protection measure, and let me quickly say that I certainly am a firm advocate of protecting the Nation's wetlands.

I suggested, for example, to the administration when we had our Cabinet Council deliberation on this that I thought it was important, for example, that maybe the administration should address the issue of protecting the wetlands. But I raised the question of whether it should be done under the 404 process. And so I think that is one of the very primary issues which it seems to me Congress may want to face.

The other one—it seems to me that Congress in a way has put the administrative agencies in kind of a difficult position. You have

charged the corps on the one hand in issuing permits to consider the matter of public interest. In other words, to consider for example if it is a flood control project, how important that project is to the citizens of an area. And to evaluate, for example, that benefit versus, say, some wetlands that might be lost. The problem then is if you are going to charge the corps with making a decision in the public interest, you should not tell the corps, through the 404(b)(1) guidelines and through the 404 veto process that, "Look, corps, you can't consider the public interest. You can only consider the environmental issues that are set forth by the Environmental Protection Agency."

Now, I am not, you know, saying whether it is right or wrong. I am just saying to you, Mr. Chairman, and the members of this committee, when I appeared before Senator Warner and Congressman Sisisky last week, the Congressman, after we went through the dialog with the three agencies, said, "My God, what kind of a monster has Congress created here to the citizens?" And so what I am saying to you as you look at this entire issue, it seems to me you will want to decide whether or not you want the present system to continue to try to work the way it is.

On the one hand, you charge the corps with a responsibility to consider in the public interest all kinds of issues. On the other hand, you charge EPA with its primary mission of protecting the environment. In this case, it is now the wetlands. I think you have to make a decision. Do you want to have a decision made in the public interest? Do you want to balance the factors? Or do you want to make it solely an environmental measure?

I am not arguing one way or another, but I am saying to you the Congress have got to help us resolve this problem because there is a great conflict at the present time.

Mr. EDGAR. Will the gentleman yield?

Mr. STANGELAND. I will ask just one question, then I will yield.

In your review of the 404 program and its relationship to wetlands, do you have information on what portion has been lost to the 404 provisions and what has been lost to, say, drainage or other areas?

Mr. GIANELLI. We have tried to work up some statistics. I don't think they are very accurate, but it may give you a perspective. For example, we understand—and I think maybe these figures came from Fish and Wildlife—that about 450,000 acres of wetlands are lost each year. Now, as near as we can tell, the loss that might be due to issuance of 404 permits would amount to something like probably 40,000 acres or somewhere around 9 percent. This kind of illustrates the point I was trying to make earlier.

Everybody looks at 404 as the way to protect wetlands. That figure demonstrates to me that it is just a drop in the bucket when you consider the entire wetland problem and when you consider all of the wetlands being lost each year.

So I guess in summary, Mr. Stangeland, I would say that the 404 program only touches or only causes a very small proportion of the wetlands that are lost each year under the 404 program.

Mr. EDGAR. I thank the gentleman for yielding.

The gentleman asked a very important question. The question I would have of you is why has not the administration, after 3 years

in office, come forward with a wetlands protection act, revisions to the legislation so that we can debate those proposals? Why are you coming before us today laying it on Congress to come up with these conclusions? Is it true the administration does not have its act together on this issue?

Mr. GIANELLI. As I tried to point out, the administration made its decision to try to do as much as it could administratively in straightening out the 404 process. We are still working on that. Ultimately, I think the Congress is going to have to deal with the issue. Some of the issues we have not been able to resolve. We are still working on them.

Mr. EDGAR. That is the very point that I am asking, and I appreciate the gentleman yielding. It seems to me that much of what you say is important. It is helpful for us to hear, important for us to see the change. But if you are coming to us and asking us for legislative change, that you bear some responsibility in coming forward with specific legislative language that the administration can support. We can come and solve your problem from the corps' point of view, and if EPA or one of the other agencies is not satisfied with the direction we go, I think we just find ourselves thwarted by possibly Presidential crankiness or veto on any changes we are going to make.

I just wondered if the administration has plans in the next month, next 2 months or 5 months, to present legislation to us to correct the very deficiencies that you are finding difficult to live under?

Mr. GIANELLI. I don't think we have any timetable on it, Mr. Edgar. I think we will in due course make some recommendations in this regard, yes.

Mr. STANGELAND. I will yield back my time for now, Mr. Chairman.

Mr. ROE. The gentleman from Pennsylvania.

Mr. EDGAR. Thank you, Mr. Chairman. I have a number of questions.

I appreciate your show-and-tell chart. We were commenting up here that the omnibus water bill that this committee is working on is a little longer than your streamers that you have placed out in terms of Federal regulations. So while it is impressive, there are some bills coming out of this committee that may, in fact, be more impressive. I am enormously impressed with the ability of the corps to deal with complicated subjects. So just because the subject is complicated does not impress me very much as a reason for change.

What impressed me a little bit more were some of the specifics you cite as to why we need some changes. Your comments about a wetlands protection act made some sense. I think there is a connection between dredge and fill material and wetlands. Isn't it true that while you state there are other concerns about wetland protection other than just dredge and fill material, would it not be a true statement to say that dredge and fill is really the primary threat to our wetlands?

Mr. GIANELLI. No, I don't think so, Mr. Edgar. I think the primary threat is from a lot of other causes and I think he enumerated them.

Mr. EDGAR. Can you be specific?

Mr. GIANELLI. Yes, along the coastal areas coastal erosion is a very great problem. Certainly the 404 program doesn't have anything to do with erosion. In addition, you can clear an area without requiring a 404 permit. Large areas of wetlands have been cleared and converted to other uses. That is another way. Another way that the wetland can be destroyed is by draining an area. Draining an area doesn't require a 404 permit.

Mr. EDGAR. Are you suggesting then that dredge and fill material placed on wetlands is a minor problem?

Mr. GIANELLI. I am suggesting it is not the only problem. It is not the only solution.

Mr. EDGAR. What level in that shopping list? It is not a major issue? It is not a minor issue?

Mr. GIANELLI. I think I tried to reflect in the statistics I gave, for example, if you take a look at the annual loss of wetlands which are reflected from some fillings, I think we have been given by the U.S. Fish and Wildlife Service, somewhere around 450,000 acres, then total loss due to 404, somewhere around 40,000 acres or about 9 percent. I don't know whether that is an accurate measure, but at least it is some indication, it seems to me, of what we are talking about here.

Mr. EDGAR. In terms of your reforms, let's say we put in place a wetlands protection act, we give the corps the total responsibility of looking at both the environmental impact and all of the other impacts that you suggest. We put in place a process where we cut from 120 days average to a much smaller number, the time it takes to approve permits. What other processes do you see necessary in order to give you full responsibility for this issue?

Mr. GIANELLI. I think I tried to indicate, Mr. Edgar, that it seems to me there is sort of a conflict, if you want to call it that, between the mission which the corps has which is to consider all of the public interest areas, and the directions the corps has to follow with respect to 404(b)(1) and 404(c), which are administered by EPA. I think that should be clarified, it seems to me.

In other words, if you want the corps to consider all the items of public interest, then you shouldn't have the corps, it seems to me, have their action subjected to a 404(b)(1) regulation that is concerned solely with environmental issues or a 404(c) veto. I don't care which it is, but it seems to me that has to be clarified.

Mr. EDGAR. Why wouldn't we go the other way? Why wouldn't we give the responsibility to the EPA to care about the wetlands and take the responsibility away from the corps?

Mr. GIANELLI. All right. That is fine and I have no objection to that. Let me make that clear. But let me point out the case I cited of the city of Chesapeake who was trying to provide flood protection for the citizens. If you are only going to consider the environmental issues, destruction of that small area of wetland as EPA, for example, registered an objection to us with respect to the issuance of that permit, then you don't put into place any balancing act.

In other words, the Congress is saying, "OK, the loss of that 24 acres of wetlands or whatever it is, is more important, and that is

going to be controlling, as to whether or not that area should have flood protection."

Mr. EDGAR. What makes the Army Corps of Engineers better at the balancing act than giving the authority to another agency that has primary responsibility over the environment but also responsibility over public good?

Mr. GIANELLI. Well, that is fine with me. I think there has been some feeling, for example, that EPA perhaps maybe doesn't have the expertise to evaluate all of the factors that the corps has. I suspect that is why it was given to the corps in the first place.

Mr. EDGAR. What expertise does the corps have in evaluating the balance that is necessary in this area that other agencies could not either develop or, in fact, do not presently have?

Mr. GIANELLI. Well, for example, the case I cited on a flood control project. It seems to me that is the corps' basic mission in life is to provide flood control in areas where flood control is needed. It is my view that the Corps of Engineers is the expert agency of the country with respect to need for flood control. I think the same could be said with respect to other uses. For example, the corps has extensive experience with respect to navigation; both inland navigation and coastal ports. As you balance all of the issues, the corps, it seems to me, does have an ability with respect to its areas of economic analysis and with respect to its other responsibilities to probably do as good a job as anybody else.

But let me say if the Congress wants to assign this to EPA, be my guest, Congressman. I would be very happy to have EPA have the entire responsibility, and just see, for example, how long the program would work in its present form.

Mr. EDGAR. Let me ask you two additional questions. I do have a couple additional questions if we have time at the end.

Do you know anything about the Westway Highway in New York and the involvement of the Army Corps of Engineers?

Mr. GIANELLI. Yes, I do. I am very familiar with it.

Mr. EDGAR. There is currently an effort to circumvent the corps' regulations and a court decision through legislation. Is this a matter for the courts, or for Congress to settle?

Mr. GIANELLI. We would hope that everyone would allow the administrative process to work, Congressman. And——

Mr. EDGAR. So you are not supporting as a legislative response?

Mr. GIANELLI. No, but now that you have mentioned Westway, let me point out, it seems to me this illustrates one of the frustrations of the present process. I am not arguing for or against Westway. I am merely pointing out the process. That project filed for a 404 permit in 1977. That is 6 years ago. The district engineer before our administration ever came aboard was ready to issue a permit on that. At that time, the matter was taken to court by a number of organizations, and the court said or ruled that the environmental impact statement that the corps had prepared in connection with its process to issue a permit was inadequate.

So it asked the district engineer to go back and review the process on whether or not the environmental impact statement was adequate. The district engineer here about 6 months ago, the then-district engineer, was about to render a decision that additional fishery studies, which was the issue, were not necessary, and to go

ahead and issue the permit. The new district engineer came aboard, arrived at an opposite conclusion. He recently said about a month ago that he thought an additional 2-year study of the impact on the fishery should be made.

I have asked the chief of engineers by the middle of next month to review that decision in view of its present posture. But again, I am not arguing the merits of the Westway project. But I am merely pointing out that the process that has been created has allowed that project to be stalled for some 7 years and possibly 2 more without a decision of go or no-go.

It doesn't seem to me that is the function that this Government ought to perform.

Mr. EDGAR. That is the famous Army Corps of Engineers versus striped bass case, right?

Mr. GIANELLI. That is correct, and let me point out again, Mr. Congressman, that with respect to the 404 program, it was originally intended to evaluate the effect on water quality. The issue on Westway is not a water quality issue. It is the issue of whether or not striped bass are going to be interfered with unduly. Again, I am pointing out to the Congress, you ought to go back and look and see if that was your original intention. Do you want the corps to be the expert in areas of fishery, or do you want them to go back and be the experts in terms of dredge and fill and its impact on water quality in the Nation?

Mr. EDGAR. A few weeks ago, I had the privilege of visiting the Philadelphia Sewage Treatment Works. In discussion with some of the people there, they discussed a particular problem they have in that city which I think happens in other cities. That is that some of their fresh drinking water leaks from old and aging pipes; gets into the sewage system and increases the need for volumes of water to be handled in the sewage treatment plants.

They are working very hard on improvements for stopping the leakage of that freshwater and other leaking problems that they have in the city, to reduce their cost of sewage treatment. Do you think that it might be cost effective for the Corps of Engineers to get more involved in directly assisting in leak detection and repair of water systems? Couldn't this issue save some money and wasted water now presently being lost?

Mr. GIANELLI. I think the corps has an expertise in this area, Mr. Edgar. Whether or not the Congress would want to have the corps do this on a nationwide basis, I think you might want to look at pretty carefully, as to the area of responsibility of local people, for example, versus Federal responsibility. I think the corps has the technical capability. Whether or not they ought to be doing that, I think, is an issue which perhaps the Congress should address itself to. But let me point out that the problem you cite is a difficult one, and also present with respect to nonpoint sources.

In other words, there is a great effort to try and get nonpoint sources to be cleaned up. I think this adds a very great burden sometimes when, for example, a city flood system is integrated into its sanitary system. So I think the whole problem of capacity of sanitary systems either by virtue of pipeline leakage, water into them or water from nonpoint sources, is a very difficult one.

Mr. EDGAR. I just close with this comment, the Moynihan amendment in the Senate and my amendment efforts in the omnibus water bill are moving, be it a little bit slowly, through the House and Senate. But there is interest in having the corps take on some new responsibility, an urban water loan program that has been developed in both the House and Senate, with strong statements of support by the Appropriations Committee in the House. It would be my hope that in some preliminary staff meetings, you are already talking about how something like that might be implemented, so that the startup time could be reduced if in fact the Congress determines and the President signs a new urban water loan program.

Mr. GIANELLI. I am sure the corps could carry out that responsibility, Mr. Edgar.

Mr. EDGAR. Thank you.

Mr. ROE. The gentleman from Pennsylvania, Mr. Clinger.

Mr. CLINGER. Thank you, Mr. Chairman.

Mr. Secretary, what, tell us, prompted the Presidential task force on regulatory reform to review the corps' regulatory program under section 404 of the Clean Water Act?

Mr. GIANELLI. Yes. I think when the administration came in or about the same time it was coming in, it received quite a large number of complaints with respect to the 404 program. As a result, I think the administration felt it had to be one of the programs of regulatory reform which would be looked at very early.

Mr. CLINGER. Why, in your opinion, was it necessary to revise the 1980 MOA-EPA, Interior and Commerce?

Mr. GIANELLI. I think it was the—there were existing MOA's with the Department of Commerce and with the Department of Transportation. And I think by virtue of the MOA's we had entered into with the other agencies, it was necessary to complete the cycle. I didn't consider them to be a major concern. But I thought we did need to bring those up to date to be consistent with the other MOA's we had negotiated.

Mr. CLINGER. So, were there any major changes in policy direction as a result of those MOA's?

Mr. GIANELLI. Are you asking about the Interior and EPA's? Or are you asking about Commerce and Transportation?

Mr. CLINGER. All three, really. There was a revision, as I understand it, of the 1980 MOA involving EPA, Interior, and Commerce.

Mr. GIANELLI. Yes, and Transportation.

Mr. CLINGER. And with Transportation as well.

Mr. GIANELLI. Yes. The initial thrust was to try to shorten the process that took so long by virtue of the successive elevations. That was the primary thrust, why we wanted those memorandums of agreements revisited and reevaluated.

Mr. CLINGER. With the objective of——

Mr. GIANELLI. Shortening the process.

Mr. CLINGER. Truncating——

Mr. GIANELLI. Exactly. I don't think you were here when I reiterated the time it could take under the whole process just by elevations, 2 years alone just to go through the elevation process.

Mr. CLINGER. Could you summarize what you perceive to be the progress that has been made under your regulatory reform efforts?

Mr. GIANELLI. I would think we have made pretty good progress in terms of eliminating the elevations as a result of the renegotiations. We still have problems, primarily with the 404(b)(1) guidelines and through our own regulations which we are in the process of reexamining now. So there are still quite a number of issues still to be resolved. But I think the MOA's, the primary accomplishments of those, as I would view it in retrospect, is that it helped to shorten the process. But it didn't necessarily uncomplicate the process, in some of the more complicated cases. That is what I think we are going to be addressing from now on.

Mr. CLINGER. So you are saying that absent any action by this committee or by Congress, there are still things that you feel the corps can do internally to shorten the process?

Mr. GIANELLI. Yes, and to help clarify the issues.

Mr. CLINGER. What is your position on section 10 of H.R. 3282? This is the bill introduced by Chairman Howard, the provisions relating to 404 that are contained in that bill. You might want to provide that for the record.

Mr. GIANELLI. If we could do that, I would appreciate the opportunity. We haven't taken any official position on that. I think it presents some problems as I may have reflected earlier by boxing in some of the environmental provisions and perhaps eliminates the ability to balance.

[The information received from Mr. Gianelli follows:]

Question. What is your position on section 10 of H.R. 3282?

Answer. It is standard administration policy to coordinate official agency views on legislation within the executive branch prior to their submission to the Congress. I have initiated action to see to it that the views of the Department of the Army are forwarded to the Committee after completion of this necessary coordination process.

Mr. ROE. Would the gentleman yield.

Mr. CLINGER. I would be happy to yield.

Mr. ROE. I think that is a very key point. The issue involved there in that particular section speaks as follows, and I quote:

> That the wetlands protection provision to prohibit the issuing of a direct and fill permit by the Corps of Engineers unless it is determined that the discharge will not have an unacceptable adverse effect on the aquatic environment and that there is no practicable alternative which will have less adverse effect.

Would you make the following observation, "any intrusion whatever is going to have some adverse effect," is that a reasonable thing to say?

Mr. GIANELLI. That is a reasonable assumption, Mr. Chairman.

Mr. ROE. I would think so. So when we are talking about an adverse effect, we are talking to what degree.

Mr. GIANELLI. Exactly.

Mr. ROE. Apparently, from what I see in this language, there really isn't any test of the degree of what. It doesn't speak of economic values, it doesn't speak of, what would you say, dilatorious effects. It simply says if it has an unacceptable adverse effect. Who is to decide that? That goes back to the issues we discussed in the corps' responsibility under the water resources development bill where the corps is the lead agency and commiserates and confers with the other agencies in the Government and makes its recommendations back to this very same committee, the Public Works Committee, on an environmental impact statement and its recom-

mendations as to whether or not a project in the course of flood control or whatever should proceed. Isn't that so?

Mr. GIANELLI. That is true. I think that is one of the problems we have, for example, with the subject of the environmental impact statement. Environmental impact statements are adequate in the eyes of the beholder, Mr. Chairman. If you are against something or believe it hasn't adequately been taken care of, then it is inadequate. I think that is one of the problems we have always had with respect to environmental impact statements.

Mr. ROE. I think what the committee has decided to do by unanimous agreement on that legislation, both in the subcommittee and full committee, yet to go to the floor, is the point of view that should there be matters of controversy that arise to a certain degree, and that those projects would come back to the committee to review that issue. The purpose of that was to take the constant confrontation with the courts out of focus and come back and say the remedy in many areas would lie with the decision made by the Congress, because some of them were of such confrontation that somebody had to make the decision. Otherwise we would be spending 6, 8, 10 percent in court, I think what you have testified to.

So we have developed at least what we see as a methodology to deal with that. Then if the Congress decides as to the three or four options that may be available, if it costs more money to mitigate, if it is going to cost $20 million or $30 million more to mitigate, then Congress has to make that decision as to what is in the public interest. Is that a reasonable approach to take?

Mr. GIANELLI. Exactly, Mr. Chairman. I think that is the whole point of it all.

Mr. ROE. Isn't it so that when you were testifying earlier, coming back and saying that Congress—and there is nobody blaming anybody here—that because of the action, and lack of coordinated action on the part of the Congress of the United States in adopting and developing a half a dozen different laws, that in effect in part, literally conflict with each other, that there is not a clear-cut decision to be made in the process that we are talking about now? Somebody has got to make a judgment and either the court—the corps is going to make the judgment, EPA is going to make the judgment, the courts are going to make the judgment or the duly elected representatives of the people are going to make the judgment.

We found that in going through a laborious effort in writing the water resources development bill that many of the areas that could be resolved were extremely expensive, in some people's mind to resolve, but if they were to be resolved in that direction, then Congress was the only one who could decide that because Congress had to provide the funds.

So it wasn't necessarily judgmental on the part of the corps or EPA, that the only way you could really get that solved was through the law. Isn't that a little bit what you are leaning toward, some process of that nature, where clarification is needed?

Mr. GIANELLI. I think so, Mr. Chairman. I think that far too much of the 404 process we see here on the board has been developed largely as a result of court decisions. It seems to me——

Mr. ROE. If the gentleman would yield, however, the court decision was based upon an action by the Congress.

Mr. GIANELLI. That is correct, but it is interpretation.

Mr. ROE. I understand that, but Congress either took an action or didn't take an action which gave rise to the courts to decide the issue. The purpose of Congress is to put into focus what the law of the land is. So that if we are going to rely upon the courts to make all the decisions, and I don't speak in any effrontery to the courts, we are going to be waiting forever because one contravenes the other. It takes years and years and the public interest isn't served that way any more than the wetlands interest or dredging interests would be served.

What I am trying to get at, and that is the point I think you have been developing along the line, that in some areas where we have these existing conflicts that somebody is going to have to decide who is in charge of the store.

Mr. GIANELLI. Exactly.

Mr. ROE. If we are going to say all matters will go to the courts, what came out of previous testimony on this issue was the point of view that some people just had the idea that they would wave a magic wand and the matter is resolved. There is such a thing as private property rights.

Does the corps or the Congress have the right to obliterate private property rights without due compensation? Then that is absolutely contrary to the Constitution of the United States. In effect, you have an adverse situation existing here where that issue is created. If we are going to protect the wetlands, somebody has got to be able to acquire those wetlands in this member's judgment and set it aside in perpituity as we do with our national parks and our wild rivers and the other things we are doing.

So what you are trying to develop, I think your testimony is very important today—what I have been trying to say to the committee as—if we are just going to write another extension and put off another 2 years to make these decisions, it is not going to solve the problems. We have to understand what the problem is and we have got to be able to deal with the problem.

I admire your point of view. I think you are right on target that, if the 404 section is to be a wetlands section, let's say so.

Mr. GIANELLI. Exactly.

Mr. ROE. If that is the case, that decision alone would cut 50 percent of the time out of there because you could say that area is a designated wetland area, and has been by some other authority. Congress has accepted it and doesn't talk about putting any dredge material in there.

Mr. GIANELLI. There is probably no city along the U.S. coast that would have ever developed under the present law.

Mr. ROE. Regardless of that, I am simply saying that is the number of the issue. The number basically, the 404 permit section did not have to do in the corps' initial responsibility with the whole array of the environmental relations, we were to make a counterbalance; is that fair?

Mr. GIANELLI. That is correct.

Mr. ROE. The gentleman from Pennsylvania.

20-955 O—84——165

Mr. CLINGER. I just associate myself with your remarks, Mr. Chairman, and I yield back.

Mr. ROE. What I am trying to do with the committee, if we are going to be productive in our hearings, is to bring the point into focus so Congress is going to act on the right thing. To add other restrictions and more delay is not going to solve the problems of the wetlands any more than it is going to solve the problems of development of the Nation. Isn't that fair play?

Mr. GIANELLI. You are exactly right, Mr. Chairman.

Mr. ROE. When we came back in the water resources development, we said, for example, in the Alabama project that had to do with Mobile Harbor, that in order to protect that 1,700 acres of wetlands, the decision, either you dump the dredge material in that wetland or you take it out to the Gulf of Mexico. And we have recommended in that legislation that yes, spend $25 million more. We have to protect that 1,400 acres. Spend the money to go in mitigation in effect and take it out and dump it into the gulf. That is a valid decision made that Congress has to decide whether it wants to spend on a cost-benefit ratio $30 million addition to do that.

We are not quarreling with that decision, but someone has to decide it. Otherwise, we have two things coming together that are not going anyplace. Is that reasonable?

Mr. GIANELLI. That is correct.

Mr. ROE. Who is next?

Mr. Snyder?

Mr. SNYDER. I would like, if the gentleman doesn't mind, to be recognized so I can kind of sort of pursue this just a little bit, because I am thinking we are overlooking something. Of course I want to welcome Bill Gianelli to the committee. He is not waffling today, as he doesn't usually waffle.

I was particularly impressed with the statement on the bottom of page 3 of your prepared statement in regard to the litigation. You recognize that there are honest and reasonable disagreements over the correct procedures and interpretation of the statutory requirements, in that court proceeding, and you indicate that ongoing settlement discussions would be fruitful in overcoming these differences. As I understand it, there are some 10 or 12 environmental groups involved in that litigation with the corps. What is the EPA's involvement? Are they a party to that suit?

Mr. GIANELLI. EPA has been part of the negotiating team that has been negotiating with the plaintiffs, Mr. Snyder. So I think the parties, the negotiation group now have come up with a proposal which I just got briefed on last week and will be examining that proposal. One of the things I will be looking at is that we don't do anything by way of settlement that will complicate that already complicated process.

Mr. SNYDER. Is it not a reasonable assumption that if a settlement can be reached in those negotiations that it would give us the basis upon which to proceed as we look at section 10 of 3282 in order to resolve the legitimate complaints and concerns on both sides of this issue?

Mr. GIANELLI. As I say, I have not yet formed a conclusion with respect to what they have negotiated.

Mr. SNYDER. I am not suggesting you have formed a conclusion. But if a settlement could be reached, let's assume one can be reached, if you can do that, will that not give us the basis upon which to proceed here to resolve the problem?

Mr. GIANELLI. It would certainly on some of the issues, but I think perhaps there may be still some major ones to be resolved. It would help.

Mr. SNYDER. In other words, all the issues are not present in the case?

Mr. GIANELLI. That is correct.

Mr. SNYDER. Would it be possible for one of your legal people to give us a sheet of paper which would outline the issues that are involved and the issues that still are remaining?

Mr. GIANELLI. Certainly.

[The information received from Mr. Gianelli follows:]

The issues involved in the pending litigation and those additional issues which have been raised in the subcommittee's hearings that are not part of the lawsuit are as follows.

The 19 counts of the plaintiff's complaint can be summarized as follows:

1. The headwaters and isolated waters nationwide permits are alleged to be illegal in several respects: Compliance with section 404(e), which requires that they cover activities which are similar in nature and have only minimal individual and cumulative impacts; and the adequacy of documentation prepared in support of issuance of those permits as provided in the National Environmental Policy Act and section 404(b)(1) of the Clean Water Act (six counts).

2. Four other nationwide permits are alleged to have similar deficiences—those for outfall structures which are also permitted by EPA; coal mining activities also permitted by the Office of Surface Mining: small hydro-power projects also permitted by the Federal Energy Regulatory Commission, and activities of other Federal agencies where those agencies have determined in accordance with CEQ regulations that the categories of activities do not have significant impacts—are alleged to have similar deficiencies (four counts).

3. The definition of general permit to include general permits which would reduce duplication of effort with another Federal agency or a State is alleged to violate section 404(e) and 404(g)–(1) (three counts). Additional allegations are:

4. Unlawful limitation on district engineers' authority to condition permits (one count).

5. Failure to follow EPA's definition of fill material. As a result, many liquid and solid waste activities are unregulated (one count).

6. The exemption for irrigation activities was unlawfully expanded (one count).

7. Department of the Army's policy on deference to State and local positions is unlawful.

8. Failure to implement the "Avoyelles" decision regarding regulation of land-clearing activities.

Issues are being discussed in the settlement which are not part of the complaint. They are related to provisions of the May 12, 1983, proposed regulations:

1. Proposed new definition of general permit to broaden use of general permits to reduce duplication of effort between the Department of the Army and other Federal agencies and States.

2. Giving great weight to the views of the State and Federal resource agencies.

3. The so-called burden-of-proof, i.e., whether the applicant must demonstrate no adverse effect or the Government must demonstrate an adverse effect.

4. Use of letters of permission which is an abbreviated process for reviewing minor 404 permit applications.

5. Treatment of denial of State water quality certification for nationwide permits.

6. Consideration of private property ownership in the public interest review.

Mr. SNYDER. So we can take a look at what might be the consensus that could be arrived at in a compromise settlement in the case, and which ones are still going to be open. This is not a request for any commitment on the corps' part or your part as to where you stand on those issues, since you are in the process of ne-

gotiating. I understand that in negotiations sometimes you take a little different position than you really want to arrive at in order to settle the matter as favorably as you can to your position.

It just strikes me that if a substantial number of the controversies are involved in this litigation over interim regulations, and if EPA is in consultation in the whole process, setting the controversy might be a good starting point from which we could proceed. I would encourage you as I would encourage Mr. Ruckelshaus and the environmental people to try to resolve the issue because it certainly is a much more advantageous way for all of us to proceed rather than being adversaries at all times in these controversial matters.

I commend you for trying to work it out. I hope you will work it out, and I believe it could give us some direction, Mr. Chairman, as to what the language of section 10 ought to be if that can be done in any reasonable timeframe. In that connection, when will you be looking at the proposal?

Mr. GIANELLI. I have it before me now. I need some staff briefings with respect to exactly what it would do and doesn't do. Again, I think you have to remember that that litigation was brought by those groups as a result of some interim final regulations which we published in 1982.

Mr. SNYDER. I am aware of that. On the interims, I would assume those settlements would reflect themselves in permanent regulations.

Mr. GIANELLI. Yes, but again, and I want to reserve until we get a chance to sort them all out, I don't think it hits many of the major issues. Certainly any settlement you can reach on any of the issues does help the process. Let me point that out.

Mr. SNYDER. Thank you, Mr. Chairman.

Mr. ROE. Mr. Albosta?

Mr. ALBOSTA. Thank you, Mr. Chairman.

I certainly want to agree with most of the things that have been said by the members, but particularly your testimony about the problems the corps is experiencing in trying to have an ongoing program in this country of improvements in our flood control protection and our harbors and our disposal problems. I want to say that I can cite some incidents in my own area where it seems like it is an endless line of redtape that has been developed that the corps just can't get over in trying to implement a project that isn't even a big project in terms of what normally is considered big in this country.

I would like to recommend to you that you would present to this committee those things that you don't think that you can do administratively, and that we should do legislatively, to undo this knot of redtape and indecisiveness that has been created by Congress, and let us know how we can best undo that.

[The information received from Mr. Gianelli follows:]

You also asked for my views on what legislation may be necessary to overcome the many bureaucratic problems associated with the 404 program. In my view the foremost issue is the jurisdictional scope of the program. We have not been able to find two scientists who can agree on where the jurisdiction should be. Further all the scientific approaches, no matter how technically sound, are still too complex for the vast majority of the public to understand. The areas which may need legislative attention area:

1. Scope of jurisdiction
2. Clarify the nature of the 404(b)(1) guidelines
3. Clarify the general permitting authority (404(e))
4. Reduce the impediments to State program transfer (404(g)-(1))
5. Expand the exemption for Federal projects with congressional endorsements (404(r))
6. Clarify the Federal/State relationship concerning maintenance of navigation (404(t))
7. Clarify responsibility and accountability among Federal agencies
8. Clarify the scope of authority of the States under section 401

I must caution, however, that these are my own views and not necessarily those of everyone in the administration.

Mr. ALBOSTA. I would ask Mr. Ruckelshaus and EPA to do the same thing because I think it is important that we continue to have some type of program in this country to improve our harbors and to continue to provide flood protection. I don't believe that we can continue to produce agricultural commodities, for instance, the way we have unless we can find new sources of land. As you say, many of the wetlands are being drained. The corps isn't necessarily by disposal taking up the most of those wetlands.

I believe that many of those wetlands are being developed through private ownership themselves. And some States are legislating what can be done with wetlands now. I don't have anything against wetlands. But I think I can show incidents where wetlands have been created by the Fish and Wildlife simply by not allowing the corps to have a cleaning program or a dredging program where they can maintain the outlets on those streams. And pretty soon the rivers just simply back up and create wetlands.

I don't believe that would be the intent of Congress. I don't think Congress would want to have situations created where we could not dredge or could not clean rivers and would create wetlands simply because we would not allow through the process anyone to move forward. I again sympathize with you and ask that you would try to come forward to this committee, and I credit the chairman for these hearings and trying to resolve the issue of redtape in an indecisionmaking that has been created by Congress and trying to straighten that out.

Have you any idea what might be some of the cost of these projects and all of the redtape that is associated with them, and how we might be able to eliminate some of that?

Mr. GIANELLI. We ran through an estimate of that, Mr. Albosta. What we did was to assume certain delays in large public works projects. It seems to me we added up a billion dollars a year very easily in terms of the cost of people being delayed by the 404 program. I think my opinion is that it is probably a conservative figure. I would invite the committee to call in the people from New York on the Westway project that has been alluded to, and find out what the cost escalation has been of that Westway project since 1977 today, then to answer the question, are the issues worth the cost. I don't know. That is up to the Congress to decide.

Mr. ALBOSTA. I think we have got enough examples, and Congress has gone through some of them since I have been here, such as the snail darter.

Mr. GIANELLI. Yes.

Mr. ALBOSTA. And some of the others that simply did not hold true. I have had the Fish and Wildlife Service tell me that a fish

will never enter a river or make that its habitat if it has been cleaned. We did ponds, fish ponds all over to raise fish. And they are manmade ponds. I just simply do not believe that. I think in most cases, this has been overstated and overexaggerated in terms of what wildlife can be created. Most of the time in my observations when you create something by man, you also create at the same time something that the wildlife can use, particularly in those areas that are wet because for one reason or another, you get a different variety of fish, perhaps, but it is still a fish.

I think it is very important for us all to remember that we have to have a relationship between those people that want the sports and wildlife refuges, with those that need the environmental quality or protection of programs. So we have to try to work that out and find a way to work together.

I appreciate your testimony here today and hope you can furnish for the committee some idea of what you believe needs to be changed legislatively.

Mr. ROE. Mr. McEwen?

Mr. MCEWEN. Thank you, Mr. Chairman.

Mr. Gianelli, in the 1977 changes to the Clean Water Act, one of the recommendations was for the States to take over the 404 program. It is my understanding no States have done that as yet and I wondered if you had any insight as to why that is the case.

Mr. GIANELLI. No, I think there are several reasons. Probably there is considerable expense connected with that. In some of the discussions we have had, I think the States would be willing to assume some of the responsibility if the Federal Government gave them funds to do that. Obviously we haven't been in a position to do that. As I recall—Mr. Rees can help me out on this—I think one of the States that moves farthest in this direction is the State of Michigan which has indicated very seriously it would like to take over the 404 program. We would be delighted if they would. But I would say that probably the cost factor is one of the biggest reasons why the States haven't been willing to assume that responsibility.

Mr. MCEWEN. I am assuming that if an area wanted to take over that responsibility that you would have no objection.

Mr. GIANELLI. We would be delighted. My personal opinion is that States are in a better position to administer the program than the Federal Government.

Mr. MCEWEN. Are you familiar with the Great Miami River Basin in Ohio around Dayton?

Mr. GIANELLI. Generally, not very specifically, Mr. McEwen.

Mr. MCEWEN. If they wanted to take over this responsibility, you would have no objection to turning it over to the Miami conservancy district?

Mr. GIANELLI. I think we look to the States, Mr. McEwen, as the logical governmental entity that perhaps ought to assume the program. I don't know whether you could break it down below the State level or not because the States have some overall responsibilities in terms of water quality and so forth already. I am not sure whether you could break it down into a smaller subdivision than a State if you were to transfer the 404 program.

Mr. McEwen. You are not congenitally predisposed to opposing it then.

Mr. Gianelli. No, but I think we would want to hear from the State itself on that issue and look at it pretty closely. I am suggesting the reasons why we have looked to the States rather than individual entities within the States.

Mr. McEwen. I have been reading Mr. Ruckelshaus' testimony and observed he made reference to the 40-percent improvement to the permit process which is a concern of his. To what do you attribute the success of that?

Mr. Gianelli. The success can be attributed directly to the fact that we don't have a half a dozen elevations. We only have two. What we are able to do is by virtue of the fact we only have two elevations in the process now, rather than five, I guess it was before, that very material has cut down the time it takes within which to process applications.

In addition, I think we have really worked on the corps and the corps has done an excellent job under General Wall in terms of its own administrative activities to speed up the process in terms of scheduling conferences in advance of public notices to try to resolve some of the issues, meeting with the parties in advance, trying to work out problems.

So I think there has been a combination of things which have resulted in our being able to reduce the time to process the average application.

Mr. McEwen. Thank you, Mr. Chairman.

Mr. Roe. The gentleman from California, Mr. Packard.

Mr. Packard. Thank you, Mr. Chairman.

I come out of local government, Mr. Secretary, and I have felt the frustrations of the process of trying to get approvals of various projects. And your directive was to improve that process, which of course you have addressed in your testimony. I sense that there have been some significant improvements in reforming the process. Have you been able to determine if any cost savings to administering the process would result from these reforms?

Mr. Gianelli. Oh, yes. I think any time you can shorten the time within which the Federal bureaucracy has to deal with an item, you are going to have substantial cost savings. We have not looked at the cost savings with respect to the administrative agencies.

Mr. Packard. Yes.

Mr. Gianelli. I was responding earlier to a question about the applicants. But I am sure there will be substantial savings we have not evaluated.

Mr. Packard. There have been no figures estimated?

Mr. Gianelli. We haven't developed any as far as I know, Mr. Packard.

Mr. Packard. All of this applies to the Clean Water Act that we are now deliberating upon as a committee and as a subcommittee. Do you have any recommended changes in the Clean Water Act that would lend themselves to improving water quality and at the same time improving the administrative reforms that you are looking at?

Mr. Gianelli. I think Mr. Ruckelshaus will be speaking for the administration with respect to general provisions of the art which I

know the committee has been deliberating. My testimony has focused solely on section 404. I think I have given the committee my views with respect to that program, what we think is needed in connection with efforts to simplify and streamline the program. Again, in responding to a question I think Mr. Edgar pointed out, I think the administration in due course will make some recommendations to the Congress on legislation which would improve the administration of 404. But that is all that I have been dealing with.

I am sure Mr. Ruckelshaus will deal with the much broader issues of the Clean Water Act.

Mr. PACKARD. But in your review of the 404 procedures and regulations, you have not uncovered in your mind or been able to make recommendations to Mr. Ruckelshaus changes that ought to be made in the Clean Water Act itself?

Mr. GIANELLI. No. I don't think we have focused our attention mainly on those matters; 404 is our primary concern.

Mr. ROE. Are there any further questions of the Secretary?

Mr. EDGAR. Thank you, Mr. Chairman. I appreciate your patience. I didn't want to let overlooked a comment you made in your opening statement dealing with land use and whether or not the Federal Government should have any responsibility to land use. I wonder what your personal views are on that issue?

Mr. GIANELLI. My personal views are I guess, Mr. Edgar, that land use is a matter which should be handled by local jurisdictions, primarily by virtue of the zoning process and what other processes might be available to local government. It seems to me they are better able to deal with that issue than, for example, the Federal Government.

Mr. EDGAR. I would respond that that is true 98 percent of the time, but isn't it true that particularly along the watersheds of our Nation, the wetland areas of our Nation, that the zoning practices of local governments have not been efficient and sufficient to protect their bad decisions as it relates to land use, as well as alternatives to flood control?

We have a community called Delaware County which I represent most of. We have 49 different townships and boroughs. In those 49 townships and boroughs, there were parks and forrests and golf courses, much of which have now been overcome by shopping centers, industrial malls and apartment complexes. Each of those individual townships and boroughs have their own township zoning practices along Darby Creek, along Chester Creek. When the corps has been asked to come in and respond to flood control and problems, they have done extensive studies, great studies, indicating that loss of life could have been prevented in every one of the floods in my communities had the zoning practices of the local communities done a better job.

That is upstream communities done a better job in protecting the lower stream communities. Yet, there is no authority either at the State level or the Federal level to get the attention of a local zoning board which may be made up of volunteers appointed by a local township or boroughs within our community.

So I find it very difficult to simply brush it aside and say that the local communities are sufficient to handle the problem because the community in which the flooding may occur may not be the

community that needs to make the land use changes to prevent that flooding in the future. It may be caused by bad zoning and bad land use policies upstream.

How do you respond to those kinds of statements?

Mr. GIANELLI. My own view, Mr. Edgar, is that I think the Federal Government is working in a number of ways to assist local agencies, for example, just in the area of flood plain zoning. The corps does have the capability and has made, as you point out, studies with respect to areas that might be subject to innundation. That is reflected to the local interest. I wouldn't say that just because local interests haven't been able to address all of the issues that might come up with respect to zoning that they aren't the agencies that should do it.

I think probably we all, Federal agencies, State agencies, and everyone should give them some assistance. But it seems to me that you need to be very careful that either the Federal Government or even the State government doesn't tread on what a lot of us feel perhaps maybe is a basic local responsibility and that is the area of zoning.

Mr. EDGAR. Let me continue to take issue at this point. The city of Chester had a terrible flood after Hurricane Agnes and there was loss of life and the Army came in and did a very good study. Not one recommendation has been approved by any of the townships and boroughs. The community of Darby, bankrupt community of poor minority people who are downstream from upstream communities, they get flooding about once a year.

The corps did an extensive study and said the way to handle this problem is to stop development in the flood plain, to move people out of the flood plain, and to make nonstructural alternatives possible by better zoning practices. Not one recommendation has been accepted or approved. Efforts have been made in each of the townships and boroughs upstream to convince them they should so something. They simply say:

> It is our authority, our jurisidction to do what we please with our communities. If we can open a drainage area and let the water go to the next community, it is the next community's problem of solving it. If we put a parking lot in place and it diverts water into another community, and floods that community, that is their problem.

I wish the idea were there where some units of government, or county government or State government, would take the initiative of banging some heads together, but it is not happening. I think we are really blinded if we don't recognize that the Federal Government, as difficult as it is, may have to make and help make some land-use decisions at the very local level to protect wetlands, to protect loss of life, to protect additional flood damage occurring. And we are in real trouble if we simply think that the local units of government in all cases are going to respond willingly and lovingly to your recommendations.

Let me go to my second point, then I will conclude. Can you give the committee the number of permit requests that you get on an annual basis?

Mr. GIANELLI. I think there are about 18,000, Mr. Edgar, as I recall last count.

Mr. EDGAR. How many of those are approved routinely?

Mr. GIANELLI. Almost all of them.

Mr. EDGAR. How long does it take? Is it the average for 120 days for all of those?

Mr. GIANELLI. The average was 120-some odd days for all of them. Now it is down to something like 80 or 82. That is an average for all of them. That is a little misleading, but it is the average.

Mr. EDGAR. So it is less than 3 months?

Mr. GIANELLI. Yes.

Mr. EDGAR. That it would take to get an application?

Mr. GIANELLI. Yes.

Mr. EDGAR. Most of them are approved?

Mr. GIANELLI. Yes.

Mr. EDGAR. It is the exception that is disapproved?

Mr. GIANELLI. Yes.

Mr. EDGAR. I want to close with this one comment about your chart. I like your chart. It is a fun chart; nice long thing. I want to compliment you on your chart, but I want to draw your attention to your smiles that you have put up on your chart. If you will notice the smiles are OK up to where they apply for an application and where you apply for a permit. Get to public hearings, it looks like it implies that the corps doesn't like public hearings because you have got kind of a sad face. Then you go to environmental assessment and you go to a frowning face. Then you go to denying a permit and I know the corps, you have just said, denies very few permits.

But it looks like you cry when you deny the permit. Then you get over there where EPA and the others make requests for evaluation. And because of that bureaucratic headache that also causes you some concern. I am not sure what you are doing at the end here, spitting out something out of the smiles, but I don't know that they add to your simplified flow chart.

I just thought I would bring that to your attention.

Mr. STANGELAND. Would the gentleman yield.

It could well be that the faces are not corps faces but rather project sponsor faces.

Mr. GIANELLI. That is what they are, Mr. Chairman. These are the faces of an applicant who has gone through this tortuous route. First he is happy. Then he is pretty sad because of what he finds himself subject to. Then he gets over to the end and I don't know what you want to say about that, but that is the applicant, not the Government, Mr. Edgar.

Mr. EDGAR. I guess maybe we ought to put two separate sets of smiles. One is the smiles that would represent the corps face. And maybe the other set of smiles ought to be that which represents public interest.

Mr. GIANELLI. Well, you have got to be careful on that one, Mr. Edgar.

Mr. EDGAR. I know public interest is a tough one.

Mr. GIANELLI. Public interest is a vague sort of a thing so I think you need to be careful. I suggest maybe under certain cases that could be the public interest, those faces, too.

Mr. ROE. Are there further questions?

Mr. ALBOSTA. Mr. Chairman, I have just one. I just wonder if the corps has ever experienced, Mr. Secretary, any particular incident

where you have created an environmental problem by some type of spoils disposal in a wetland area.

Mr. EDGAR. Would the gentleman yield?

Mr. ALBOSTA. I would like to get an answer to that question first.

Mr. GIANELLI. I am sure there are some cases where the corps has approved a permit where the environmental organization would feel it has caused great damage. Maybe Mr. Edgar wants to give a case, but I don't think I can cite any specifically right now.

Mr. ALBOSTA. Well, it just seems to me that most of the time it is an effort to stall the project. And I just wanted to make that point.

Mr. ROE. Let me suggest the following. I want to ask just one more question for the record. I believe you mentioned in your testimony that, or someone mentioned, I think you did, Mr. Gianelli, that there was only one veto by EPA over the whole last couple of years.

Mr. GIANELLI. I think someone else made that point, and I think that is true. EPA has only exercised a 404 veto, I think, once.

Mr. ROE. Have you any observations to that? Let me frame the question better. It seems to me we are trying to bring coordination and organization together. We know we have got all kinds of conflicts involved and conflicting laws and so forth, and we are communicating. The corps is always subject to a little bit of, what would you say, confrontation. What would be your observation, only one veto? That seems kind of strange.

Mr. GIANELLI. I think perhaps you ought to ask EPA that. We have two cases now, I think, that are pending on which EPA is considering for using the 404(c) veto. But I think the fact that it is there represents a threat. I think, as the Congressman who appeared before me indicated, it is his intention that the veto be exercised more frequently. I think his legislation is aimed at requiring EPA to exercise it more frequently. So it is there, whether it is used or not.

Mr. ROE. The Chair didn't miss that. What I am trying to get at is just for the record that the fact remains that the opportunity for EPA to agree or not agree was there and you are talking about 18,000 applications a year.

Mr. GIANELLI. Yes.

Mr. ROE. And EPA only objected once. They weren't precluded from objecting 18,000 times, were they?

Mr. GIANELLI. Not as far as I know.

Mr. ROE. Let me suggest the following: I think that your testimony has been excellent this morning. You have obviously stimulated a great deal of interest on not only the—well, on behalf of all of the members. I think you have brought into very, very clear focus a major issue involved, above and beyond the timeframe is the question as to where the responsibility should lie, and how we move it along, how we serve the public. And it seems to me that your testimony is extremely valuable to us in our whole thought process.

I want to thank you for your patience this morning and excellence of your presentation. And you know, let me make one more comment. Having gone through a year's study with the corps and having observed the order of magnitude of their problems, it seems to me the time is at hand around this place where we may disagree

on some solutions, and there may be voids to be filled in the legislative process and administrative process. But it is about time the corps got a little credit for some of the work it is doing, too. So I just wanted to make that point to you.

Mr. GIANELLI. I think the corps does an excellent job under very difficult circumstances sometimes, Mr. Chairman.

Thank you very much.

Mr. ROE. Thank you. No further questions?

We thank you for being with us.

Mr. GIANELLI. Thank you?

[Subsequent to the hearing, supplemental questions were submitted to Mr. Gianelli by Representative Stangeland. The questions and responses follows:]

DEPARTMENT OF THE ARMY,
OFFICE OF THE ASSISTANT SECRETARY,
Washington, D.C., January 10, 1984.

Hon. ARLAN STANGELAND,
House of Representatives,
Washington, D.C.

DEAR CONGRESSMAN STANGELAND: This responds to your November 29, 1983, letter raising five additional questions concerning my testimony of November 15, 1983, on the Clean Water Act. I understand this information will be added to the hearing transcript.

My responses are enclosed. I appreciate the opportunity to appear before your Committee and to provide this additional information. I believe firmly that given a better regulatory and statutory framework, we can achieve the desirable goals of the Clean Water Act with much less bureaucracy, less delay, and much more responsiveness to the public than is now the case.

WILLIAM R. GIANELLI,
Assistant Secretary of the Army
(Civil Works).

Enclosure.

1. *Question.* During some of our earlier hearings, it was suggested that the Assistant Secretary of the Army as well as the Administrator of EPA be subject to suit to enforce his duties under the Clean Water Act. Would you please give us your view of this proposal?

Answer. I view such a proposal as unnecessary. Adequate provisions ensuring that the Secretary of the Army discharge his duties under the Clean Water Act already exist. For example, proposed regulations implementing section 404 of the Act are published in the Federal Register for review and comment. Public reaction to proposed regulations is fully considered in developing final regulations. These rulemaking procedures are subject to judicial review, as seen in *NRDC* v. *Callaway* and in the current litigation on Corps permit regulations. In addition, case-by-case implementation of the program has repeatedly been challenged, as seen in a number of cases on individual permit decisions. Furthermore, both the overall implementation and day-to-day operation of the program are subject to Congressional oversight, which has played an important role in development of the section 404 program. In summary, the system as it is now structured provides ample opportunity for public, judicial, and Congressional review of the program. Making the Secretary subject to citizen suits will not improve program implementation. To the contrary such a provision could be subject to abuse from unwarranted suits intended solely to delay permit actions.

2. *Question.* On page 3 of your statement you mention your continuing work with EPA to clarify the scope of jurisdiction for section 404 permitting. Do you have any idea how soon this may be resolved and a new proposal made?

Answer. We and EPA have worked diligently in trying to develop a definition of waters of the United States which would clarify the scope of jurisdiction. We have been frustrated at every turn. The state of the art is such that a wide range of views exist among technicians, policy makers and lawyers. As a result, we have not been able to come very close to a consensus on what the definition should be. I have concluded that legislation would be required if the current definition is to be changed in the near future.

3. *Question.* I am pleased that you are working to reach a settlement on the litigation of the July 1982 regulations. Do you see such a settlement being completed in the near future?

Answer. In December, we reported to the Judge in the litigation that we had agreed in principle with the 16 environmental organizations. However, separate suits on the same issues had been filed by the State of Alaska and the North Slope Borough of Alaska. As of this writing, we expect to conclude an agreement with the North Slope Borough within a few days. I regret however, that our negotiations with the State of Alaska have reached a stalemate. We are jointly searching for ways to break that stalemate. We remain hopeful of reaching a settlement agreement, and we are pleased and encouraged by our ability to work with the environmental groups to resolve mutual problems.

4. *Question.* In your response to Congressman Edgar's question about the percentage of permits that are denied annually, you stated that "very few" are denied. Please elaborate.

Answer. The actual denial rate is about 2.3 percent. However, that does not tell the whole story. Because of the complicated, burdensome process, about 20 percent of the applicants withdraw their applications before final actions are taken. We have no estimate of how many of those withdrawals might have been issued or denied had the process run to a conclusion. We suspect that most would have been denied or substantially modified. It is regrettable indeed that many projects succeed or fail on the basis of how well they withstand the administrative process rather than on their merits.

In addition, of the 75 to 80 percent of the applications which survive to issuance, about one-third of those are modified or conditioned as a result of the process. All too often the applicants have agreed to modifications or conditions in order to avoid delays which would result from the built in conflict resolution process. In addition, by focusing on procedure rather than substance, as much of the process now requires, we are diminishing our capability to reach sound decisions in a reasonable period of time.

5. *Question.* In response to a question from Congressman McEwen, you said that cost was the primary reason States have not assumed the 404 program. Are there any other reasons?

Answer. Cost was a primary factor. It should also be noted that the regulations established by EPA, with which States must comply, are exceedingly cumbersome and withhold from the States the ultimate authority to implement decisions. EPA has structured regulations with so many disincentives that States have simply not been very interested. In partial defense of EPA, the statute is very complex in this area and is far more technical and detailed than most statutes. This has made it difficult for EPA to draft regulations which would be attractive to states, but we feel a much better job can be done on these regulations. Another factor has probably been the bureaucratic morass and the notorious delay and public inacceptibility of the 404 program, all of which may have made states reluctant to get involved.

Mr. ROE. Now, our next witness this morning is Mr. J. Leonard Ledbetter, director of the Environmental Protection Division, Georgia Department of Natural Resources representing the Association of State & Interstate Water Pollution Control Administrators. We want to welcome you to the committee.

For the honor of welcoming you formally, I would certainly defer to my colleague and good friend, the Honorable Roy Rowland of Georgia.

Mr. ROWLAND. Thank you, Mr. Chairman.

Mr. Chairman, thank you for the opportunity to introduce to the subcommittee this morning one of the country's most outstanding environmental leaders.

Leonard Ledbetter has served with the Georgia Office of Environmental Protection for 18 years, the past 9 as director. He succeeded an almost legendary figure in that position, the late Rock Howard who started the office with himself and one secretary.

Georgia's environmental program now has a staff of some 380, and has become recognized as a model and a leader for the Nation.

Under Leonard Ledbetter, Georgia ranks right at the top among the 50 States in meeting State and Federal standards for clean air, clean water, strip mining control, solid waste management, and in all of the many programs he administers.

He has been selected for a number of national positions, and is currently serving on the President's task force to better delineate Federal and State roles in the environmental field.

It is a pleasure to introduce this morning Mr. J. Leonard Ledbetter.

Thank you very much for being here, Leonard.

Mr. ROE. Thank you for that splendid introduction, Roy.

Mr. Ledbetter, the full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

ASSOCIATION OF STATE AND INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS [ASIWPCA]

I. INTRODUCTION

Mr. Chairman and members of the Subcommittee, I am J. Leonard Ledbetter, Director of the Environmental Protection Division, State of Georgia. I am here today representing the collective views of my State colleagues in the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA). The ASIWPCA commends the Subcommittee for its interest and commitment to the environment and we appreciate the opportunity to participate in these hearings.

The Association is the national non-partisan organization of the State Officials who, on a daily basis, implement the Clean Water Act. The 50 States, 6 Interstate Agencies, 3 territories, and the District of Columbia are represented. As professional managers of State Water Programs, the ASIWPCA membership is firmly committed to the environmental objectives set out in the Clean Water Act.

In the last decade, tremendous strides have been made in water clean up. Recognizing that this Subcommittee is aware of the December 1982 Lou Harris and Associates report, "A Survey of American Attitudes Toward Water Pollution", we are encouraged to note that the results indicate a majority of the public believe State and local levels of government will provide stricter enforcement of water pollution laws than what can be achieved at the Federal level.

ASIWPCA can assure the members of Congress and the public of the States' continuing commitment to the Clean Water Act objectives and a strong national water program:

States now manage over 70 percent of the National Water Program.

The Nation's waters are essentially fishable/swimmable.

Pollution loadings have been substantially reduced: In industry: 69 percent of BOD: 80 percent for suspended solids; and 75 percent for heavy metals. In municipalities: 57 percent for conventional pollutants; and 67 percent for heavy metals.

Billions have been invested by the nation's taxpayers and industries to control water pollution with remarkably successful results.

ASIWPCA contends that this progress in maintaining and enhancing the quality of our nation's waters is in large part attributable to the effectiveness of the State/Federal partnership and the fact that:

Water quality programs are implemented faster and more effectively at the State level.

Ambitious objectives and a limited program budget require efficient, flexible approaches.

A balanced program, using the various mechanisms contained in the act, is most productive.

II. SUMMARY HIGHLIGHTS OF ASIWPCA RECOMMENDATIONS

Section 106.—ASIWPCA supports maintaining the $75 Million authorization level in FY 84-88 for State implementation of the partnership established in the Clean Water Act.

Water quality standards.—States strongly support attaining the water quality goals and believe current law is adequate in that regard. The ASIWPCA endorses the concepts set forth in the regulations recently promulgated by the U.S. EPA.

Toxicity elimination and management strategy.—A National, technically sound process should be established to assess and control toxicity on a facility-specific basis. Such a strategy should be based on the successful implementation of Best Available Technology (BAT) and supplement technology requirements and water quality standards.

Pretreatment.—The pretreatment program for industries discharging into publicly owned treatment works should be improved. It is the understanding of the Association that a number of Congressional members are pursuing such reforms. The ASIWPCA Board of Direction believes legislation should embody the concepts outlined in this testimony to provide a limited time period for exemplary, existing local programs to seek approval.

Compliance deadlines.—Industrial compliance with Best Available Technology should be required no later than 3 years after effluent guideline promulgation—this will greatly enhance program credibility and effectiveness; and the §301(i) deadline extension should be expanded to cover all municipalities. By July 1985, municipalities should specify how and when compliance will be reasonably achieved.

Construction grants.—Municipal wastewater treatment remains a major challenge to the Clean Water Act goals. A sustained level of Federal commitment is important in that effort. While this program can always benefit from improvements, ASIWPCA suggests for the sake of stability and program management that Congress defer action in this area until the statutorily mandated reauthorization period under Public Law 97-117.

Nonpoint sources.—Primary responsibility for nonpoint source pollution control should remain with the States, who should be accountable for program management. The Federal Government should assist through research and development, demonstration programs, technical assistance, and financial incentives.

Permitting.—The authorized length of NPDES permits should be extended up to 10 years (with reopener provisions) to more efficiently use available resources. ASIWPCA supports partial delegation of the permit program.

Penalties.—Any expansion of Federal penalties should not jeopardize existing State NPDES delegation agreements. U.S. EPA imposed penalties should be used only when the State, after notice, has failed to act.

IV. ASIWPCA RECOMMENDATIONS

State officials are convinced that the existing law is fundamentally sound. There are, however, some refinements which could enhance program performance and expedite the National Clean Water Program.

A. State Management Assistance Under Section 106

ASIWPCA recommendation

The Association commends the Subcommittee for continuing to recognize the importance of section 106 State management assistance in the National Water Quality program. We support maintaining the current authorization level of $75 Million.

We are all aware that State management needs are significantly greater than the currently authorized amount, yet we recognize the fiscal crisis being experienced throughout this country. For this reason, the ASIWPCA supports appropriating section 106 funds, as a minimum, at the fiscal year 1983 level of $54.2 million.

Rationale

Section 106 State Management Assistance Grants are more fundamentally important to the National Water Program and the achievement of the Clean Water objectives than any other aspect of the Clean Water Act for a number of reasons including: section 106 provides the cohesiveness necessary for effective, comprehensive water quality management; and the cooperative State/Federal partnership depends upon each partner living up to their commitments as in any contractual arrangement.

Section 106 activities form the core of the National Clean Water Program and include planning, water quality standards, NPDES permitting, pretreatment, compliance, enforcement, and monitoring. As this subcommittee is fully aware, the Clean Water Act deadlines are approaching, the program is growing in complexity, and Federal requirements have increased. It becomes increasingly important under these circumstances that States be assured of sustained, adequate Federal support to their administration of the nationally required program.

The administration has suggested in the past that less section 106 funding is needed because set asides under section 205 can offset substantial reductions such as the 56 percent decrease proposed last fiscal year by President Reagan. ASIWPCA disagrees. Set asides under section 205(g) and section 205(j) of the Act have purposes separate and distinct from the activities supported by section 106. As such, they cannot offset reductions in section 106 funding without seriously endangering Title II objectives: section 205(g) funds are necessary first and foremost to meet state obligations under construction grant delegation agreements. Section 205(j) is targetted by law for specific purposes and most section 106 activities are not eligible (e.g. permitting and enforcement).

B. State Water Quality Standards

ASIWPCA recommendation

No further legislation is necessary on water quality standards. The ASIWPCA endorses the concepts established in the water quality standards regulations recently issued by the U.S. Environmental Protection Agency in response to State and public comment. After close scrutiny, ASIWPCA believes these provisions provide adequately for the continuation of:

(1) Strong anti-degradation policy;

(2) State authority to identify priorities, allocate resources, and implement requirements more strigent than Federal law;

(3) The technology-based effluent requirements;

(4) Protection of downstream designated uses; and

(5) Consistency with the requirements of sections 101(a)(2) and 303(c)(2) of the Clean Water Act.

Rationale

The State's role and responsibility in establishing water quality standards is an important aspect of the Clean Water Act's State/Federal partnership. The States have gained substantial water quality management experience using technology-based effluent requirements and water quality standards. As this subcommittee recognized in the 1981 Amendments (Public Law 97-117), a great deal of standards work remains to be done because:

Some standards were initially established without adequate information on their validity or appropriateness.

Congress and the public demand efficient investment of construction grants funds—water quality standards are used to define priority.

Sound, defensible standards require significant time and resources to develop.

C. Toxicity Elimination and Management Strategy [TEAMS]

ASIWPCA recommendation

In addition to supporting full utilization of BAT requirements and water quality standards, a Toxicity Elimination and Management Strategy (TEAMS) should be incorporated into the National Clean Water program. Specifically, the Association recommends that the National Clean Water Program provide, by a date certain, for:

(1) U.S. EPA to establish procedures and methods for biological assessment of acute and chronic toxicity of effluent and receiving waters,

(2) U.S. EPA to establish guidance on categories of industries and muncipalities which may need to conduct biological toxicity assessments,

(3) NPDES permittees to submit action plans for characterizing their effluent and conducting biological toxicity assessments,

(4) States to develop implementation strategies for eliminating toxicity from significant dischargers,

(5) NPDES permits to be revised specifying compliance with toxicity elimination (based on the permittee action plans and State strategies),

(6) U.S. EPA to place additional emphasis on providing States special technical assistance and adequate toxics research and development, and

(7) State participation in development of procedures, methods and guidance for implementation.

Rationale

The combination of traditional State water quality standards and Federal Best Practical Control Technology has generally been adequate to control conventional pollutants and appears to be providing a certain level of control for toxics. However,

the elimination of toxicity (not pollutants per se), under section 101(a)(3), is the next logical concern.

We want to stress that technology-based guidelines and water quality standards are a necessary part of the National program. For some parameters such as heavy metals, they are frequently the best mechanism for toxicity control. However they are not very useful in other instances. Criteria for hundreds of organics would be difficult if not impossible to develop from a technical or resource standpoint. The pollutant-by-pollutant approach has limited relevance to complex effluents.

A technically sound process with a biologically based protocol is needed to supplement the pollutant-by-pollutant approach in the control of toxicity on a facility-specific basis. A National mandate would provide positive direction for U.S. EPA, States, and NPDES permittees in their efforts to eliminate toxicity.

U.S. EPA and the States should jointly develop the methods and guidance to expedite toxicity control. Research and development as well as technical assistance must be strengthened particularly in the areas of environmental toxicology, complex organics analysis, and industrial abatement technology. Over the long term, these efforts will improve our understanding of biomonitoring techniques, human health effects, risk management, synergism, and allocation procedures.

New legislation should not retard the significant progress being made at the National and State level. Many States have instituted programs to eliminate toxicity and U.S. EPA has moved forward by drafting an approach which holds promise as a workable strategy. Several National seminars have been sponsored both by the ASIWPCA and U.S. EPA.

D. Pretreatment

ASIWPCA recommendation

Improvements are necessary in the national pretreatment program to more effectively and efficiently protect publicly owned treatment work (POTW) operation and the environment. It is the understanding of the Association that a number of Congressional members are pursuing such reforms. The ASIWPCA Board of Direction believes such legislation should embody the following concepts:

(1) POTW's with exemplary, fully operational programs should have a limited opportunity to request program approval—no delay in national program implementation should be allowed,

(2) Such municipalities must demonstrate in their request that their program:

Protects treatment facilities and the environment:

Satisfies section 402(B)(8) of the act,

Complies (or is on a schedule to comply) with secondary treatment and water quality standards;

Incorporates enforceable pretreatment requirements and sufficient resources, capability, and authority; to monitor and implement; and

Provides safe use and disposal of sludge.

(3) Alternative programs which are approved must: submit annual compliance reports; and establish monitoring programs to verify adequate environmental protection.

(4) Permits may be modified based on verification results. States should then be able to approve the alternative program for new sources.

Rationale

Pretreatment was incorporated into the Act to ensure indirect industrial discharges did not interfere with POTW operation, sludge management, or ambient water quality. ASIWPCA fully supports this effort and recognizes pretreatment is a necessary element of the National Water Program. States have a large interest in National pretreatment policy not only because they manage the National program but also because they develop and implement the program in some municipalities and are ultimately responsible in most States for full implementation of the Act.

It is widely recognized at the National, State and local level that the pretreatment program, as currently structured, is unworkable:

The pretreatment program, if fully instituted as defined, will dwarf the NPDES program in size and scope, and will cover many more sources,

Many communities do not have the time or resources to implement the very complex requirements—a simpler approach would be adequate. High administration costs would be met at the expense of other environmental priorities, and

In the 6 years since the 1977 amendments, the track record for implementation has been less than impressive.

20-955 O—84——166

It is simply not good public policy to ask a municipality to dismantle a good program for the sake of national uniformity. Momentum is lost and the environment will not, necessarily, be better protected. In fact, in some States the national categorical standards have been proved less environmentally effective. We believe the Subcommittee can rectify the situation because the problem centers around process and procedures—not environmental objectives or requirements.

E. Compliance Deadlines—(1) Industrial Compliance Deadlines

ASIWPCA recommendation

Best Practicable Treatment [BPT].—BPT should be maintained as the minimum national treatment requirement for industrial discharges.

Best Available Technology [BAT].—BAT compliance should be required no later than 3 years after effluent guideline promulagation which U.S. EPA should complete by July, 1984.

Best Conventional Treatment [BCT].—BCT should not be required uniformly because of BPT's proven effectiveness in pollution abatement. Water quality need should be the basis for going beyond BPT for conventional pollutants.

Rationale

While the deadline for BPT was quite successful, resulting in substantial clean up of conventional and toxic pollutants, the same cannot be said for BAT deadlines. Effluent guidelines have been delayed and the situation is not likely to improve.

Arbitrary deadlines tarnish the credibility and stability of the Act. They have not been an effluent inducement to guideline issuance. It is difficult, if not impossible, to accurately anticipate the complex policy, administrative, and legal problems which inevitably lead to delay.

(2) Municipal Wastewater Treatment

ASIWPCA recommendation

Amend Section 301(i) to require muncipalities to: Formally complete planning and fiscal analysis by July 1, 1985 specifying how and when compliance will be achieved (with or without Federal funds); and

Comply at the earliest practicable date.

Rationale

Municipal wastewater treatment will be a major challenge of the next decade. This is not to say that industrial clean up is unimportant, but that municipalities lag far behind in meeting the minimum requirements of the law. As this Subcommittee is fully aware:

Construction grant needs far exceed the Federal funding available;

Water quality standards require substantial levels of treatment;

Compliance deadlines are ambitious; and

Adequate pretreatment must be institutionalized.

The compliance deadline was extended in § 301(i) under the 1981 Amendments for municipalities with Federal funding who will finish construction by 1988. However, further action is needed to address those municipalities who will not receive such funding but in good faith expected to participate in the Federal program. They should promptly prepared action plans for reaching compliance with the law. The reasonableness of any deadline will vary depending on the immediacy of the water problem, availability of alternative funding, planning required, and construction needed.

F. Municipal Wastewater Treatment Construction Grants

ASIWPCA recommendation

A sustained level of Federal commitment to municipal wastewater treatment construction grants is important to the National Clean Water Program. While this area can always benefit from management improvement, ASIWPCA suggests, for the sake of stability and program implementation, that the Congress defer action until the statutorily mandated reauthorization period under Pub. L. 97-117.

Rationale

The 1981 amendments significantly reformed and redirected the national municipal wastewater treatment program placing special emphasis on reducing Federal

funding assistance and increasing local accountability. The program is currently under significant transition in the States to meet the intent of Congress. Clear national policy direction and program stability is needed to maintain and build on this momentum. A thorough reexamination of the construction grants program should be made during the reauthorization period established in Pub. L. 97-117.

While the Federal Government has a clear responsibility to support municipal wastewater treatment, the needs identified ($118 Billion) exceed the Federal financial capability. States, local governments and the private sector are currently weighing their options—a recent ASIWPCA survey indicates many States are moving forward to establish alternative financial programs and strengthen local ability to comply with the law (see attachment). Several National ASIWPCA workshops have been held to foster this activity. We would ask that these efforts be reviewed in reauthorizing Public Law 97-117.

G. Nonpoint Source Control

ASIWPCA recommendation

Primary responsibility for nonpoint source pollution control should remain at the State level to efficiently and effectively promote pollution abatement. States are well underway in developing nonpoint source programs using regulatory and voluntary approaches to comply with the Clean Water Act. Their progress should be closely monitored.

The Federal Government should assist States through research and development of control techniques, demonstration programs, technical assistance, and financial incentives. Existing Federal funding programs, particularly in the Department of Agriculture, should be used to protect water quality. ASIWPCA recognizes after an appropriate period of evaluation, it may be necessary to further address nonpoint source problems in the law.

Rationale

The goals of the Clean Water Act cannot be met solely through point source control. Many of the Nation's rivers and lakes are adversely impacted by nonpoint sources and substantial improvements can be made with effective nonpoint source controls. However, this is not easily accomplished because nonpoint sources are particularly difficult to control. They are highly variable, have no defined point of origin and can be extremely diffuse. This requires a different management scheme than used for point sources.

Congress mandated that States develop and implement plans to assure that nonpoint sources do not preclude beneficial uses. These approved section 208 plans provide an excellent basis for clean-up. Indeed States are implementing their plans—many without Federal assistance.

States must have flexibility in continuing these efforts since problems are site specific; the appropriateness of regulatory and voluntary programs vary; and land use is historically a local responsibility. ASIWPCA also recognizes that much remains to be done and the Federal Government can make a very useful contribution.

Further amendments to the act should build on existing authorities and programs. In the process, it is important to maintain the public support which has been largely responsible for the progress achieved. The Subcommittee should examine not only the need for a new incentive program but also improvements in existing programs under other Federal Agencies. The latter, if administered correctly, could be of enormous benefit in nonpoint source pollution control.

ASIWPCA is currently working with the U.S. EPA on their report to Congress required by January 1984. The ASIWPCA States' Evaluation of Progress [STEP] report, a project the Association has undertaken with U.S. EPA and a recent membership survey should provide useful information for the report (see attachment).

H. NPDES Permits and Delegation

ASIWPCA recommendation

The Association supports partial delegation and authorization of up to a 10 year NPDES permit life (while continuing to use reopener clauses in all NPDES permits).

Rationale

The Association supports partial NPDES delegation. As this subcommittee knows, institutional considerations in States (some with large numbers of point source discharges) may preclude full assumption of delegable activities. There is no question that the Clean Water Act is implemented faster with less cost to the taxpayer at the

State level. U.S. EPA should take full advantage of State willingness to manage NPDES program components. However, in doing so, the law should not be interpreted or selectively applied to undermine that partnership.

The Association believes the authorized NPDES permit life should be extended from 5 to 10 years to more efficiently use scarce resources. Of course, NPDES permits should continue to include reopener clauses allowing permit modifications at any time for cause (e.g. adoption of effluent guidelines, revision of water quality standards, identification of toxics problems/process modifications). States have ample opportunity in exercising their reopener prerogative to review discharger performance and related permit limitations.

I. Penalties

ASIWPCA recommendation

Expansion of Federal authority under section 309 should not jeopardize existing approved NPDES State delegations. Congress should clarify that increased Federal penalties will not require changes in State delegated programs. Federal penalties should only be imposed when a State has failed to impose appropriate sanctions and the State has received 30 days notice from U.S. EPA of such finding.

Rationale

Proposals to expand US EPA's enforcement powers and penalty amounts are developing at the same time increased emphasis is given to delegating more responsibilities to the States. While the Association appreciates the objectives in amending section 309, the impact on NPDES delegated States (whose programs are well established) should be carefully considered.

Strong US EPA enforcement could encourage quick settlement of permit violations—but it is equally likely that the possibility of later US EPA action will interfere with State ability to negotiate clean-up. The potential impact of such "double jeopardy" merits close attention.

J. Dams

ASWIPCA recommendation

Direct regulation of dams under the Clean Water Act should rely primarily on the section 401 certification process and section 404 to control water quality impacts. NPDES permits should not be required at this time.

U.S. EPA should study water quality problems associated with dams and recommended appropriate abatement techniques.

Rationale

Recent reconsideration of the Clean Water Act's application to dams has centered around the issue of whether dams should be point or nonpoint sources.

The Association believes this issue has little bearing on the ultimate question—specifically, what is the appropriate process for protecting water quality from the adverse impacts of dams?

We do not believe the NPDES process is the appropriate avenue. The State certification process under sections 401 and 404 of the act has been very effective in protecting water quality. ASIWPCA does not anticipate that application of this process to dams will adversely affect current workload. However, since the magnitude of these problems is not fully understood, further study is desirable.

STATEMENTS

October 1983

THE STATES' Water Quality Fact Sheet

ASIWPCA'S PROJECT ON EVALUATING WATER QUALITY

The Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) is in the process of analyzing and compiling State responses to a newly developed report for describing the past decade's progress in improving water quality. The report form has been designed through a pilot project funded by the U.S. Environmental Protection Agency's (EPA'S) Offices of Water and Policy and Resource Management. The project began in October 1982, and is expected to be concluded early in 1984.

Known as STEP (STates' Evaluation of Progress), the project is expected to improve the States' ability to describe their water quality program activities and results. Ten States participated in developing the format for presenting information on their most important water quality achievements. The ten are: Vermont, New York, Delaware, Georgia, Illinois, Texas, Kansas, Utah, Arizona and Oregon. Representatives from these States have been serving on a project Task Force that has conducted many of the key project activities.

A test run of the draft format was completed in April by these States. Based on the findings of the 10-State test, the report format was discussed with ASIWPCA members in a series of nine Regional Workshops attended by representatives of 42 States. Reports were requested from all States and have been submitted over the past 2 months. Their contents will be synthesized in a State/EPA Report to Congress on the past decade's progress in water quality improvement; an Appendix composed of the individual State responses will also be prepared.

STEP's final product will be a report to the EPA Administrator providing the participants' recommendations about institutionalizing the water quality reporting system and possibly expanding its application to other environmental media.

Policy direction for the project is being provided by a Steering Committee co-chaired by J. Leonard Ledbetter, Director of the Georgia Environmental Protection Division, and Robbi J. Savage, ASIWPCA's Executive Director. Among the Committee's members are two senior officials from EPA Headquarters, 3 Regional EPA Administrators, and a representative of the National Governors' Association's Water Management Subcommittee. The 10 States noted above are also represented on this Committee.

Comments or questions about the project can be directed to Carol Jolly, the Project Manager, at (202)624-7782.

Association of State and Interstate Water Pollution Control Administrators

Hall of the States • 444 North Capitol Street, NW, Suite 330 • Washington, D.C. 20001

Robbi J. Savage — Executive Director (202) 624-7782

Mr. ROE. Please proceed.

TESTIMONY OF J. LEONARD LEDBETTER, DIRECTOR, ENVIRONMENTAL PROTECTION DIVISION, GEORGIA DEPARTMENT OF NATURAL RESOURCES, ON BEHALF OF THE ASSOCIATION OF STATE & INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS, ACCOMPANIED BY LINDA EICHMILLER, DEPUTY DIRECTOR, ASSOCIATION OF STATE & INTERSTATE WATER POLLUTION CONTROL ADMINISTRATORS, AND STEVE RIECK AND CANDY PENN, OFFICE OF THE GOVERNOR OF GEORGIA

Mr. LEDBETTER. Thank you, Mr. Rowland, for that fine introduction.

Mr. Chairman, I appreciate the opportunity to come before the committee again to speak on behalf of the States and ASIWPCA. You are quite familiar with our organization. The staff of this committee has worked with us over the years and we are most appreciative of the open approach that is used in this committee; the accessibility the States have to your staff; and this opportunity today to express our views on several subjects.

With me today is Linda Eichmiller of the staff. Also I have with me this morning Steve Rieck and Candy Penn of Governor Harris of Georgia's staff.

I do appreciate you making our entire statement a part of the record. Instead of reading our summary to the subcommittee this morning, I would like to touch on two areas. I would like to take a few minutes to talk to the committee about progress the States believe have been made under the Clean Water Act over the last 10 years. We think that Congress in the Clean Water Act has given us a very workable approach. The record demonstrates that that partnership can be effective and States are committed to continuing this partnership under your leadership so that we can continue to improve the waters of this Nation. We are committed to the goals of the act and we appreciate the directions that you have set forth.

I would like to briefly tell you about a project that we have underway with EPA in which the States recognize the difficulty you here in Congress have in assessing where we are in our movement toward the goals of the act. So we proposed well over a year ago that we work with EPA to have the States use the same format so that Georgia, Vermont, Texas, California, New Jersey, and the other various States would put together a progress report periodically using the same format. EPA was delighted to work with us on that. We are well underway with that.

I am pleased to tell you almost all States have in voluntary fashion come forward and followed that format and put together information which we are presently compiling. We hope to provide to Congress with the report after EPA has had an opportunity to review and coordinate with us in late winter or early spring. We think that it will be very useful to this committee, in particular in the future as you look at the progress we are making.

There are a few highlights that I might touch on: More than 70 percent of the clean water program is now administered by the States. In looking at the reports that have been submitted which I have recently reviewed, most of the Nation's waters today are

meeting the fishable/swimmable goals of the act, if you look at the miles of stream and acres of lakes we have throughout the Nation.

We have reduced the pollution loads substantially, both from an industrial standpoint as well as a municipal standpoint.

We have invested billions of dollars of the Nation's taxpayers' money to accomplish those goals. We still have some major challenges that I want to come back and talk about a little later, but I did want to point out in the beginning that we have made tremendous progress in this Nation with the clean water program.

What I would like to do, to expedite my comments so we can spend most of the time addressing questions you may have is to briefly touch upon a number of issues of concern to ASIWPCA. Those would be the section 106 funding of the States programs, water quality standards, a toxicity/elimination strategy pretreatment, compliance deadlines, construction grants, nonpoint sources, the NPDES permit program, and penalties.

If I may I will just take a few minutes to touch on each of those very briefly. Section 106, of course, is the part of the act that provides, to those of us who are managers in the States, the funding in conjunction with our State funds to manage the program. In recent years that funding has been rather constant from the Federal level and in many States, including my own State, we have doubled the State input to the process. So we are delighted to see this committee is considering maintaining the $75 million authorization level for the fiscal year 1984-88 period, and we certainly encourage you to do that.

On the subject of water quality standards I think this committee is quite familiar with the controversy that has surrounded that subject over the past year. We in the States, and ASIWPCA have devoted many hours in reviewing and commenting and meeting with EPA trying to address some of the issues that surfaced. We are pleased with Administrator Ruckelshaus' recent decision to go forward with several changes, and those changes are now in the Federal Register.

We think, based on where we are with that program, that it would not be helpful to us at this time to have any further legislation on water quality standards. Instead we should continue moving forward with the law as it is and with the new rules as Administrator Ruckelshaus has promulgated.

Let me talk to you a minute about something I referred to earlier as the toxicity elimination strategy. We refer to that as elimination and management strategy because we see a problem facing us in the States is that we have written the NPDES permits and required BAT and evaluated those requirements against water quality standards. But in many cases the question still lingers. Do we have some toxicity in those receiving waters? Is there toxicity in the effluent that could impact the receiving waters? So we have worked with EPA, and with the leadership of many of the States developed a process involving biomonitoring and bioassays.

So after you have installed BAT and are assured that the water quality standards that are on the books in that given State are being met, many of us now, including the State of Georgia, are coming back and putting into the NPDES permit some specific requirements for the discharger to put together a plan to conduct

monitoring and bioassays on their effluent prior to it being discharged to the receiving waters.

The advantage of that approach is that it enables us, on a case-by-case basic where we suspect there might be some toxicity, to go through a standard procedure or scientific approach developed by the States and EPA to address that question in detail. When it is determined that there is toxicity, then you can proceed through the process of elimination to determine what is causing that, and then require that the toxicity be addressed.

In some cases we have had industries change their manufacturing process. They have eliminated some particular chemical compound they were using and used a substitute that would not be toxic. So there are several advantages to that approach. It certainly is much more effective and more expeditious than trying to crank out a categorical standard that would include every imaginable organic and inorganic chemical.

So we would like for the committee to address that issue possibly in the amendments.

On the subject of pretreatment, it ties very closely to what I just talked about with the toxicity elimination. Primarily what we are trying to do through the pretreatment process is to protect the integrity of the waste water system in the community. Unfortunately the program that is there now has been very cumbersome under the present act as it has been administered.

We in some of the States have gone forward and put into place pretreatment programs. In my own State of Georgia we have a pretreatment program where we are actually issuing permits to approximately half of the industries in the smaller communities and controlling, through a permit process, the pretreatment program. In the other approximately 50 percent we have mandated that the city use a permit process or a sewer use ordinance get on with the pretreatment program.

We are concerned, as EPA proceeds with the categorical standards, a long period of time might be involved. This will slow down the program and create some problems for those of us at some later date where some of the numbers could vary slightly. So we would like to see language added allowing local governments and the States to work together through the NPDES permit program specifically to allow a local pretreatment program to be reviewed and approved if it meets certain criteria that you could set forth, such as having the publicly owned treatment works meet water quality requirements and effluent standards or be on an enforceable schedule to comply. In addition, such facilities should have enforceable pretreatment requirements and certainly necessary resources for monitoring and implementation.

Moving to compliance deadlines, another subject, I think it is obvious to all of us that the deadlines are not going to be met. We would recommend very briefly two approaches. Industrial compliance with BAT should be required within 3 years, or earlier, if possible, after the effluent guidelines are promulgated. For municipalities it is a much greater problem. For many years, many of our local governments have been on a priority funding list, looking forward to grants. The authorized level for grants often exceeded the

appropriated amount and those communities have not been moving forward on this list.

States think it is time we require the municipalities to address the issue. There are innovative and alternative financing techniques being put into place in many of the States now, including our own State. And with the reduction in the Federal percentage, and the elimination of reserve capacity, those innovative and alternative financing techniques can be more attractive to the local governments than they have been in the past. In short, we need to put some emphasis on the local governments proceeding instead of just sitting on the waiting list for the Federal grant that may not come, ever.

Two or three other subjects, Mr. Chairman, I would like to touch on briefly. Construction grants being one of those. We always come back to this subject it seems when we discuss the Clean Water Act. One of the reasons for that is that in most of our States, if you look at the most severe environmental problem, it still is water pollution caused by local governments. I have talked to my colleagues around the country and all of us still have some major problems in getting our publicly owned treatment works up to the standards that they need to be.

We think one of the problems we have had in the past, one I touched on briefly before, is that the authorized level of funding has almost always been over the last 10 years, considerably greater than the amount appropriated. That has tended to give false hope in many cases to local governments. State water administrators think that the best approach at the present time is to continue the commitment we made. As States, and Governors, when we came to the Hill 2 years ago and pledged to this committee and others that we would work with the $2.4 billion level of funding, move the program forward, and agree with the elimination of reserve capacity and reduction in percentage of Federal funding.

We believe it is very important that the funding level be sustained. It is the roller coaster effect that we have had with this program over the last 10 years that has been quite disruptive to the States and the local governments, as we have tried to plan efficient use of the dollars. So ASIWPCA would urge that we continue with this present part of the Clean Water Act (title II) as it is for at least another year while we evaluate where some of us are going in the States through the innovative and alternative financing.

One reason I would urge that is that we think this committee could be very helpful in looking at some of the grant money being made available to us as loans. In my own State, and I know in the State of New Jersey and many other States around the country, the State is trying to put into place a mechanism to use loans and State grants to expedite this program and help local governments go forward. If we had some flexibility to use very low-interest loan or no-interest loan, in effect we would be giving to that municipality a tremendous grant, particularly if we could give them a no-interest loan from funds provided under the Clean Water Act. In many cases we would be giving them about a 3 to 1 grant, because the interest rates that they pay today are very substantial over a 20-year period, even on a $10 million project.

On the subject of nonpoint sources I mentioned earlier ASIWPCA is doing a report with my State colleagues throughout the country using the same format. It addresses nonpoint source pollution. Depending on the State you are in that may be from agricultural runoff, mining, urban runoff, construction, et cetera. What I have detected in reviewing the reports that have come in to date is that about 32 States indicate that their major nonpoint source problem is related to agricultural runoff. So by far, the major nonpoint source problem impacting water quality is related to agricultural runoff.

The good news is that most of the States, while stating there are significant water quality problems, report that nonpoint sources have not had major, detrimental impact on the major designated use, such as fishing.

I talked earlier about the fact that most of the waters of the Nation are now fishable. What happens is that we have intermittent degradation due to the runoff from agriculture, urban, and other sources, but it is not precluding the designated use in most of the States. I have talked to many of my colleagues from Vermont, Texas, across the country, and we are only seeing about 10 or 12 States that are saying nonpoint source is having major interference with their designated uses. So we think an emphasis needs to be placed on the part of Congress is recognition of this fact.

We hope the committee can provide leadership with EPA and the Department of Agriculture to focus some of the available funds already there through the Department of Agriculture and other national programs to address the nonpoint source from agricultural and other activities.

In our own State we made tremendous progress for many years through Soil Conservation Service programs and other programs promoted by the State, the Extension Service, et cetera. Now we find with the larger equipment and excessive acreage, the farmer now plows right across many of the terraces, ignoring many of the practices their fathers had put into place. So there needs to be some disincentives or incentives, for those type of activities.

ASIWPCA thinks that this can be addressed through the USDA. We hope that you will encourage the Administrator to go forward with what we understand he plans to do. In addition, we feel some time is needed to see how successful we are going to be in many of the other areas. We have just completed in most States, including my own State, the 208 planning effort and putting into place the best management practices.

We are now into the implementation phase. We don't know how successful we are going to be. ASIWPCA thinks States need to work with EPA to implement those and then to come back to this committee in a couple of years possibly to see how much more we need to do. I think there is more being done with the nonpoint source in most States than has been visible, because we have been busy putting into place with many different groups, the forestry commissions and the Soil Conservation Service people, the best management practices. Now that we have established those and made them available, we have got to implement them to see how effective we will be.

The final two points I would make relate to permitting. The States do support partial delegation. You have many States like Texas where the program is administered by several agencies. It would be more efficient for the Federal and State government to allow partial delegation of the NPDES program to some of those States. One of the things that almost all the States are interested in is a 10-year permit. We have in my own State probably 2,000 NPDES permits which about 100 industrial and 100 municipal are really majors. There would be much more efficiency in government if we used 10 year permits, where States could reopen the permits in case we have a water quality problem being created. We would urge the committee to look at that.

Finally, on the subject of penalties, if the Administrator needs additional penalties, certainly we do not object to that. But we in the States have two basic concerns. One is a situation we have encountered under the Clean Water Act with oil spills, where EPA as well as the State is in the process of fining the entity that allowed that to occur. States find the entity sometimes saying, "Well, we are not going to settle with the State until we see what the EPA does." Then they go to EPA and say, "We aren't going to settle with you until we see what the State does." We would like to see, as far as the penalty section related to the NPDES program, that as long as the State is carrying out the program effectively that EPA wouldn't come into the picture. Only where the State didn't enforce the law should EPA be authorized to impose penalties.

The second point is that the Agency in the past has interpreted this section of the act to say that the State had to have the same level of penalty. Many States encountered major problems in getting language into their law on the $10,000 penalty that is in the Clean Water Act now. We would urge this committee not to jeopardize the NPDES program that has been delegated to almost all the States by putting language into the act that would force us to come back and increase from $10,000 up to $25,000 or some other amount, because we have many other management tools.

Just to give you two or three quick examples, one of the most effective tools I have in enforcing the Clean Water Act is the sewer ban moratorium. That will get city hall's attention much quicker, not because I do. It's but because the builders and construction people appear at city hall the next day. We don't need the increase in civil penalty to be effective in the States. I would hope if you give that management tool to the Administrator that it will be done in such a way so as not to jeopardize the delegated NPDES programs; that is, not then impose the change in the law on the States.

In closing, Mr. Chairman, I will be, of course, pleased to respond to any questions you may have. I would like to once again thank you for the opportunity to testify and to thank you for your leadership over the years regarding the Clean Water Act program.

Mr. ROE. I thank you for your testimony.

Mr. STANGELAND. You heard the question asked of Secretary Gianelli about the main impediments to delegation of 404 permit responsibilities to the States. He said funding was probably the key problem. What do you see as the main impediment to the delegation?

Mr. LEDBETTER. I think that the entire program cannot be delegated under the present act because as we have always had explained to us by EPA and the corps, phase one as they call it, the old navigable waters that the corps regulated for so long would still be retained by the corps.

We are interested in Georgia in having the program delegated to us, but we want the entire program. We think it would be further confusion of the bureaucracy to have the applicant come to my office once for a 404 permit and the next time he has to go to the corps, depending exactly where he is located. So we in the States would certainly recommend that that be addressed if you are going to make changes in the law.

The other problem we have had is the unnecessary amount of redtape and procedure, and his simplified flow chart; I don't see how he made it that simple because it is not that simple in the experiences I have had with it.

I think the money is the third impediment as far as we are concerned. If you could address those other two issues, first, the entire program delegated to the State and, second, streamline a lot of the redtape, many of us would assume that responsibility and funding would not be that major an issue.

In our own case, for example, we do all the environmental permits. EPA has delegated all the other environmental programs to us. It is efficiency in Government, whether you are dealing with a public official, an industrial official, environmentalist, private citizen, whatever, when they can come to one agency and get all the permits in Georgia except 404. We would be interested in it, but not as it is now presented to us.

Mr. STANGELAND. Are you, I gather then, in support of the Secretary's efforts to streamline the 404 process?

Mr. LEDBETTER. Yes. We would not want to see the program weakened with respect to the wetlands protection, but it is so cumbersome.

Mr. STANGELAND. A number of approaches have been suggested for the control of toxicity. You are suggesting a somewhat different approach. What are the advantages of the association recommendations over others we have heard, in your opinion?

Mr. LEDBETTER. First of all, we see it as something that complements the ongoing program. You don't stop what we are doing now. You continue with the NPDES program of requiring BAT. We proceed with the program that is in place. Then we come back with this mechanism to expedite things.

As I mentioned, at the rate EPA can develop the effluent guidelines, and especially as you get into a lot of these inorganic and organic chemicals, they are going to be beyond the year 2000 trying to determine what the numbers need to be in a lot of cases. We can implement the ASIWPCA proposal today.

As I mentioned, we have already written it into permits in Georgia, and we are using it. We think that it is something the committee could use to strengthen the Clean Water Act, rather than dealing with numeric standards because those numeric standards are very expensive, and it takes so much time to develop them.

Mr. STANGELAND. Some have testified that changes in the national pretreatment program would represent weakening the Clean Water Act. Would you comment on that position?

Mr. LEDBETTER. Well, the national pretreatment program as it has been administered has been a weak link in the program. It is a weak link now. We think the fact it has moved so slowly speaks to the fact there needs to be a new approach tried.

That is the reason we are recommending the approach I have summarized. ASIWPCA thinks it would strengthen the program and certainly be more expeditious in getting on with the subject. We are concerned that many of our communities are spending millions of dollars. Without a good pretreatment program we are not protecting the taxpayers' investment or the water quality and certainly not the integrity of that biological system.

Mr. STANGELAND. Your association recently surveyed States on the nonpoint source pollution problems. Did that survey show any cost to analyze the total problem of nonpoint source pollution? Was there any cost estimate?,

Mr. LEDBETTER. We are actually involved in two reports dealing with nonpoint sources. The one I have been talking about, the report we are doing with EPA, does not speak to dollars. We are involved with a survey now that is going out to all the States to try to get additional information so we can work with EPA in providing the report that Congress has asked by the first of the year, or shortly thereafter. It is possible some dollars may be provided there. At the present time we do not have them.

Mr. STANGELAND. I guess what my question is directed to is that your statement says that while nonpoint source pollution from agriculture is the biggest problem, it hasn't caused that much degradation in the water. We are talking then of silting, fertilizer runoff, chemical runoff, pesticides and herbicides.

I am just wondering what it is going to cost to survey just exactly what is in that pollution, what are the pollutants going into the water, No. 1. Then, of course, the overall cost I think is of a tremendous magnitude to correct it, but the costs to determine how much degradation are we doing to the water from agricultural runoff.

Mr. LEDBETTER. That varies from State to State. I think we are almost there in my own State because we are just finishing the section 208 studies and reports. That was one area where we spent a great deal of money and time. So I don't think we are going to need more money to answer that question in our State. I think we had the funds under 208.

And we will have answered that question by sometime early next year when we compile all the results of the studies we have been making with our university system, the agricultural community and others.

Now other States vary on that, so I don't have a good number for you.

Mr. STANGELAND. You mentioned that the States are just beginning to implement section 208 plans and put in place best management practices. To what extent are they really being implemented and to what extent are they just sitting on shelves, and what could be done to encourage implementation of those programs?

Mr. LEDBETTER. Well, I think to answer the last part of the question, to encourge the implementation, would be for this committee to look for the Administrator requiring the States to go forward with a nonpoint source program as well as their point source program. Again, I think you are going to see something that varies all over the country as to where we are in carrying those out.

In our own case, mandatory programs are addressing several of those areas such as soil erosion and sedimentation from construction sites, et cetera. But there are still some voluntary programs we think will work with the agricultural community if we can put incentives into place through USDA and others.

Mr. STANGELAND. Would you provide copies of your nonpoint source review papers when you get them?

Mr. LEDBETTER. Yes, sir, we would be delighted to.

[The information follows:]

Association of State and Interstate Water Pollution Control Administrators

Robbi J. Savage
Executive Director
Secretary Treasurer

March 7, 1984

Honorable Robert A. Roe
Chairman
House Subcommittee on Water Resources
B376 Rayburn House Office Building
Washington D.C. 20515

Dear Mr. Roe:

The Association recently completed several national surveys on nonpoint source pollution problems and control programs, specifically, ASIWPCA's:

- States' Evaluation of Progress made over the last 10 years in water pollution control (the STEP project), and
- nonpoint source survey.

During the Association testimony on the Clean Water Act before your Committee, the STEP* and survey results were requested by the Committee. The preliminary analysis has just been completed and is forwarded for your consideration. The results will be published shortly with the ASIWPCA Board of Direction's approval. Highlights are discussed below.

Summary Results

The information ASIWPCA obtained from the States vastly improves the national data base. Results indicate States have given more attention to nonpoint source pollution as municipal and industrial discharge programs have matured. They recognize better ways must be found to identify and control priority nonpoint source water quality problems. This presents a new challenge. In contrast to the discharges from point sources that occur on a predictable daily basis, nonpoint source discharges are intermittent and as a result may have less potential to affect designated uses.

* The STEP Project's Report to Congress entitled America's Clean Water, States' Evaluation of Progress 1972-1982 will be released in late March.

Hall of the States • 444 North Capitol Street, NW, Suite 330 • Washington, D.C. 20001 • (202) 624-7782

20-955 O—84——167

Nonpoint Source Survey

The preliminary results of the ASIWPCA nonpoint source survey (see Attachment A) provide a current and detailed understanding of program status at the State and local level regarding the:

- progress being made in nonpoint source program development and implementation,
- geographic variability,
- priority of nonpoint source problems, and
- future program needs.

Inadequate funding appears to be the major obstacle in achieving nonpoint source control, but others of importance include: lack of knowledge on cause/effect relationships, lack of public understanding of the problems and issues, questionable economic feasibility of controls, and inadequate laws and regulations.

STEP Results

The STEP project focused on case studies and the extent to which nonpoint sources impaired designated uses. The results are useful in promoting implementation. As indicated in the ASIWPCA testimony, such problems may be more manageable than previously thought:

- General -- 36 States indicated they had severe nonpoint source problems, However, their frequency varied widely (see Attachment B).
- Extent -- 21 States had "extensive" nonpoint source problems , i.e. they were the major cause (equal to or greater than 40%) of less than full support of designated uses :
- Priority -- 16 States indicated nonpoint sources were a "priority water quality problem", i.e. they were not only extensive, but also severe enough to impair a designated use on a localized or wide-spread basis:

Number of States With Priority Nonpoint Source Water Quality Problems

Category	Wide-Spread	Localized
Agriculture	10	2
Mining	1	9
Hyromodification	1	2
Residuals	1	1
Construction	-	4
Silvaculture	1	1

Future Issues

Both the STEP project and the ASIWPCA survey indicate policy areas which merit further attention. The Association intends to assess them over the next several years in cooperation with the US EPA under a cooperative agreement. The results should provide a more solid basis for national decision making. They include:

Cause and Effect

- Nonpoint source problems appear to be greatly influenced by natural erosion, geographical location, and hydrologic regime (e.g. lakes vs. streams),
- Intermittent nonpoint sources vary in the extent to which they cause long term use impairment, and
- The effectiveness of management practices in improving water quality needs more documentation.

Responsibilities -- All levels of government share roles and responsibilities in nonpoint source management:

- The Federal government manages vast amounts of land and large financial programs,
- Local communities manage land use , e.g. construction and urban runoff control, and
- All share control of residual waste management.

Funding -- State Water Administrators support Federal matching programs to foster nonpoint source controls, but the appropriate nature and extent of such funding needs further clarification.

Should you desire additional information on this or other issues related to the water quality program, we would be pleased if you call on us.

Best Regards,

Robbi Savage

Appendix B

STATES' EVALUATION OF PROGRESS (STEP)
--
GENERAL FINDINGS ON NONPOINT SOURCE IMPACTS

STEP results from the 45 States reporting on nonpoint source problems are outlined below:

Nonpoint Source	Number of States With Severe NPS Problems	General* Extent of NPS Pollution	
		Wide-spread	Local-ized
Agricultural	16	29	12
Urban	11	8	35
Mining	15	2	36
Land Disposal	12	5	35
Construction	6	7	34
Dams and Channels	7	5	33
Forests	4	6	27
Saltwater Intrusion	2	1	21

* number of States

Of the 36 States indicating the presence of severe nonpoint source problems:

- Agriculture is by far the most severe and wide spread problem (14 States)
- Mining is the most severe localized problem (14 States)
  - .. Urban is second (10 States)
  - .. Residuals is third (9 States)
- Less Severe nonpoint source pollution generally follow this order. However, construction and hydromodification were the most common moderate and localized problems.

The nonpoint source pollutants most seriously affecting water quality in most States are suspended particles of solid materials, nutrients that promote undesirable growth of algae, waste-related bacteria, pesticides and heavy metals.

Definitions:

Severe	impairment of a designated uses. Note that more moderate impacts were also documented in STEP.
Wide spread	50% or more of States waters are affected by a category of nonpoint source pollution
Localized	Less than 50% of States water are affected by a nonpoint source of pollution

Analysis of the States' Response to ASIWPCA Nonpoint Source Pollution Survey

February 1984

Prepared by the Nonpoint Source Committee
Water Quality Management Task Force
Association of State and Interstate Water Pollution Control Administrators

DRAFT

Introduction

In 1982, the Association of State and Interstate Water Pollution Control Administrators (ASIWPCA) recognized nonpoint source pollution as being an important water pollution control issue. A Nonpoint Source Pollution Control Committee was formed as part of ASIWPCA's Water Quality Management Task Force. The committee developed a nonpoint source pollution questionnaire. In November, 1983, the ASIWPCA Board of Direction authorized the questionnaire to be sent out to the states.

This report is a summary of responses from 43 states to the questionnaire and provides an overall evaluation of current state nonpoint source programs, problems, issues, needs and future direction as perceived by a majority of the states.*

Most of the state agencies that were polled are responsible for the assessment, oversight and control of nonpoint source pollution.

Assessment

States use a variety of chemical, physical and biological parameters to assess nonpoint source pollution. Nonpoint source pollution assessment can be divided into three major levels of detail: statewide reconnaissance inventories, statewide comprehensive assessments and intensive surveys in selected problem areas. Most states have completed statewide reconnaissance surveys. Only two states have developed detailed statewide comprehensive assessments based on monitoring data during runoff events. Most states have conducted intensive monitoring assessments during runoff events in specific problem watersheds.

* A telephone survey was conducted. An additional six states answered key questions. These questions were 29, 31, and 48 of the Nonpoint Source Questionnaire; see Appendix A for questionnaire results.

Assessments in selected problem watersheds have been specific enough to guide implementation efforts to reduce the effects of nonpoint sources in these areas. The majority of states indicate that they have unmet needs for further assessment of nonpoint source pollution and Best Management Practice** (BMP) effectiveness on water quality.

DRAFT

Water Quality Standards and Beneficial Uses

Almost all states indicated that they have attributed water quality problems to nonpoint source pollution. These problems are identified as impairments to beneficial uses and violations of water quality standards.

Almost all state standards were established to protect streams during normal or low flow conditions. Only a very few states have specific water quality standards for variable or high flow conditions. Lack of criteria for periods of runoff when nonpoint source pollution normally occurs may be a significant constraint to program effectiveness when dealing with rivers and streams.

Sources and Impacts of Nonpoint Pollution

Most states identified agriculture as being a major contributor to water pollution followed in decreasing order by urban sources, construction, mining and silviculture (Appendix B). The majority of states indicate that nonpoint source pollution has the most impact on rivers, streams, lakes and ponds followed in decreasing order by groundwater, wetlands, estuaries, oceans and bays.

** Methods, measures, or practices to prevent or reduce water pollution, including, but not limited to, structural and nonstructural controls and operation and maintenance procedures. BMPs may be applied before, during, or after pollution-producing activities to reduce or eliminate the introduction of pollutants into water bodies. (From EPA report to Congress: Nonpoint Source Pollution in the U.S.)

Forty-three percent (43%) of the states stated that current nonpoint source pollution problems are greater in magnitude than point source problems. Thirty-five percent (35%) of the states stated that current nonpoint source pollution problems are equal in magnitude to point source problems. Twenty-two percent (22%) of the states stated that nonpoint source pollution problems are less in magnitude to point source problems (Figure 1). In a majority of states, nonpoint source pollution causes widespread problems to fisheries through habitat damage and nutrient enrichment (Figure 2). The most significant widespread problems were recreational impairment from sedimentation, decreasing aesthetics (weeds, algae, clarity and litter) and the occurrence of pathogens (Figure 3). To a lesser degree, states identified turbidity and chemicals as being a widespread problem with water supply contamination.

DRAFT

Best Management Practices and Their Water Quality Benefits

Many states have the means to set priorities for the correction of nonpoint source problems and have identified BMPs to address those problems. For the most part, states have identified BMPs that can be applied to local conditions, are economically feasible, and are acceptable to the public. Most BMPs are modified, added or deleted as needed. Although traditional BMPs are being used to correct nonpoint source problems, many states believe additional BMPs and innovative approaches may need to be developed to improve water quality. Research should continue on BMP effectiveness in relation to water quality improvement. Research results need to be transmitted to state and other implementing agencies. Most states have information on success stories they believe could benefit other states. A few states have documented specific instances where nonpoint source pollution controls failed to yield a desired water quality response; this information would also be beneficial to the other

#31 FIG. 1 THE MAGNITUDE OF NONPOINT SOURCE POLLUTION IN COMPARISON TO POINT SOURCE POLLUTION

FIG. 2 Fishery Impairment

FIG. 3 Recreational Impairment

states. Most states recognize the need to better document the degree of water quality improvement from installed BMPs.

DRAFT

Existing Nonpoint Source Control Programs

Almost all states use a mixture of federal, state and local programs to control nonpoint source pollution problems. Most states use both voluntary and regulatory approaches to control nonpoint source pollution depending on the source being controlled. The majority of states have regulatory programs for mining, construction and urban nonpoint source pollution. Virtually all states rely upon the educational/voluntary approach for agricultural nonpoint source problems. Many states have state cost share programs for agricultural nonpoint pollution; while some states back up their voluntary and cost share efforts with a regulatory approach.

Many states indicated that they have the necessary legal and institutional framework to carry out an effective nonpoint source pollution control program; but there was a significant minority which stated that they were not fully prepared, due to either legal or institutional problems. Most states have the means to coordinate federal, state and local nonpoint source pollution control efforts. The majority of states have adequate means to disseminate nonpoint source pollution information and to obtain and incorporate public input into their nonpoint source pollution control efforts.

Most states reported that very few local units of government have taken steps such as local ordinances, land use controls and educational programs to control nonpoint source pollution.

DRAFT

Most states indicated that while USDA cost-sharing programs may minimize soil erosion problems, they only partly respond to water quality problems caused by agricultural sources.

The majority of states favor regulatory approaches for mining, construction and urban nonpoint source pollution and then only at the state and local levels. The majority of states favor non-regulatory programs for agriculture and silviculture.

Obstacles to the Control of Nonpoint Source Pollution

The states identified inadequate funding as the major obstacle in achieving adequate nonpoint source pollution control. Other obstacles or constraints identified by the states are: lack of knowledge on nonpoint source cause/effect relationships, lack of public understanding of nonpoint source problems and issues, questionable economic feasibility of nonpoint source controls, and to a lesser extent, inadequate laws and regulations.

Future Needs and Outlook

Currently, the majority of states are using 205j funds for nonpoint source activities and nearly all the states are in favor of continued funding for Section 314 Clean Lakes Program which can be used in specific watersheds to control nonpoint source pollution. At this time, most states do not have adequate funding for the assessment and control of nonpoint source pollution (Figure 4).

Ninety-three percent of the states questioned answered that ASIWPCA should actively support efforts for a federal match program for the assessment and control of nonpoint source pollution.

FIG. 4 Inadequate Funding

Association of State and Interstate Water Pollution Control Administrators

ASIWPCA

ASIWPCA NONPOINT SOURCE SURVEY

Introduction

The following survey has been prepared by the ASIWPCA Water Quality Management Task Force. Results will be used to:

1) foster communication between States on nonpoint source problems and issues

2) generate a comprehensive information base on State nonpoint source management efforts and program approaches which may be effective in addressing water quality problems.

3) enhance the Association's ability to address State needs.

4) develop a better understanding Nationally of the State perspective

The data from this survey will be analyzed and the results compiled for use by the States and US EPA. Our intention is to use the information as the vehicle to assist US EPA in drafting the report Congress required by January, 1984.

Please feel free to make any additional remarks not covered in the survey. If you have any questions, please call Bill Markley, South Dakota Department of Water and Natural Resources (605-773-3296).

43 written responses were received. All responses are shown as percentages of total answers to each question except where otherwise indicated.

State _____

Staff contact (Name, title, phone) _____

_____

	Yes	No
1. Is your agency the prime agency for nonpoint source pollution assessment? If not, please indicate the agency? _____	100%	0
2. Is your agency the prime agency for nonpoint source pollution control? If not, please indicate the agency. _____	80%	20%

	Yes	No
3. Does your state have an accurate assessment of NPS pollution—its causes, areas of impact, and severity?	33%	67%
4. Does your state have guidance/criteria for defining a nonpoint water quality problem?	50%	50%

5. Please check the statement best describing the detail level of your inventory.

a. Statewide reconnaissance inventory	2%
b. Detailed statewide inventory based on monitoring data	5%
c. Inventory is a "mixed bag". In some areas we have a good documentation of NPS water pollution, in other areas little or no reliable data exists.	84%
d. Our state has not made an assessment of NPS water problems per se. Information we have on hand is primarily from our ambient monitoring of point source pollution.	7%
e. Other _____	2%

	Yes	No
6. Does your state have additional NPS assessment needs?	95%	5%
7. Does your state have a means of setting priorities for identified NPS problems?	63%	37%
8. Does your state have a comprehensive list of BMP's to address NPS pollution problems? If so:	77%	23%

		Yes	No
	a. Are BMP's applicable to local condition?	97%	3%
	b. Are they socially accaptable across the state?	77%	23%
	c. Are they deemed econcmically feasible?	84%	16%
	d. Are BMP's modified, added or deleted as needed?	85%	15%
	e. Are additional BMP's needed?	68%	32%
9.	Does your state have an adequate means of assessing water quality impacts of BMP's that have been installed?	29%	71%
10.	Does your state have unmet needs for assessing water quality impacts of installed BMP's?	84%	16%
11.	Does your state have adequate water quality monitoring to assess ongoing impacts of NPS pollution?	14%	86%
12.	Has your state found innovative and cost-effective means of water quality monitoring to determine NPS impacts?	29%	71%
13.	Does your state presently have a means of coordinating NPS pollution control efforts across the state, at the local, state and federal levels?	59%	41%
14.	Does your state have the necessary legal and institutional framework to carry out an effective NPS pollution control program?	61%	39%
15.	Does your state have an adequate means of obtaining and incorporating public input into NPS pollution control efforts?	84%	16%
16.	Does your state have a means of evaluating management agencies involved in NPS pollution control?	71%	29%
17.	If an evaluation of management agencies reveals ineffectiveness, does your state have a means of making needed changes?	59%	41%
18.	Does your state have adequate funding for technical assistance needed to install BMP's?	7%	93%
19.	Does your state have an adequate means of disseminating information about NPS pollution and BMP's to pertinent persons and agencies?	57%	43%

		Yes	No
20.	Does your state believe that adequate research is being conducted on NPS pollution and its control?	17%	83%
21.	Does your state have particular achievements in NPS pollution control that could benefit other states?	88%	12%
22.	Does your state have water quality problems attributed to nonpoint sources?	98%	2%
	a. If so, are they identified as impairment to beneficial uses?	95%	5%
	b. If so, are they identified as violations of water quality standards?	83%	17%
23.	Does your state have specific water quality standards provisions that establish criteria for runoff or high stream flow conditions?	5%	95%
24.	If not, does your state apply water quality standards for low or normal flow to runoff or high stream flow conditions?	73%	27%
25.	Which of the following parameters has your state utilized to assess NPS impacts: *		
	a. Total Solids	50%	___
	b. Dissolved Solids	65%	___
	c. Suspended Solids	91%	___
	d. Total Phosphorus	88%	___
	e. Ortho Phosphate	74%	___
	f. Total Kjeldahl Nitrogen	74%	___
	g. Nitrates	84%	___
	h. Nitrites	65%	___
	i. Ammonia	67%	___
	j. Pesticides	76%	___
	k. Heavy metals, please specify	70%	___
	l. Priority toxic pollutants, please specify	30%	___
	m. Fecal coliforms	86%	___

* The percentages for question 25 are based on the entire 43 states.

		Yes	No
n.	Biochemical Oxygen Demand	72%	____
o.	Conductivity	67%	____
p.	Turbidity	81%	____

	Dissolved oxygen loss	40%	60%
	Pathogens (shellfish, etc.)	31%	69%

		Yes	No
	Nutrient enrichment	76%	24%
c.	Recreational impairment		
	Pathogens (viruses, bacteria, parasites)	49%	51%
	Aesthetic (weeds, algae, clarity, litter)	77%	23%
	Sedimentation	79%	21%
28.	Do you use modeling tools for predicting NPS cause/effect relationships in your state?	38%	62%
29.	Does your state consider the following nonpoint categories, major contributors to water pollution: *		
	a. Agriculture	85%	15%
	b. Construction	54%	46%
	c. Mining	56%	44%
	d. Silviculture	27%	63%
	e. Urban nonpoint sources	56%	44%
	f. Other, please specify	____	____
30.	Does your state consider nonpoint source pollution to have major impacts on the following water bodies: **		
	a. Rivers and streams	90%	10%
	b. Lakes and ponds	86%	14%
	c. Estuaries	51%	49%
	d. Groundwater	55%	45%
	e. Oceans and bays	44%	56%
	f. Wetlands	58%	42%
31.	Does your state consider current nonpoint source pollution problems: ***		
	a. Greater in magnitude than point sources	43%	____
	b. Equal in magnitude to point sources	35%	____
	c. Less in magnitude than point sources	22%	____
32.	Does your state have state funding for nonpoint source assessment?	26%	74%

* Percentages include personal communication with Alaska, Maine, Nevada, and Rhode Island.
** This may not be a true estimate of Estuaries, Oceans and Bays, since some states are not located near them.
*** Percentages include personal communication with Alaska, Indiana, Maine, Nevada, Rhode Island, and Virginia.

33. Identify any constraints or obstacles to solving NPS pollution problems which exist in your state. Please check whether you believe the following is an obstacle to NPS controls.

	Obstacle	Not an Obstacle	Undertermined Obstacle
a. Lack of knowledge on NPS cause/effect relationships.	55%	29%	17%
b. Lack of proven NPS control technology to restore water uses.	28%	42%	30%
c. Economic feasibility is questionable. Cost of NPS controls may be greater than benefits.	49%	19%	33%
d. Lack of public understanding of NPS problems and issues.	57%	31%	12%
e. Inadequate laws/regulations.	38%	43%	19%
f. Inadequate funding.	95%	2%	2%
g. NPS problems are few and insignificant relative to point source problems.		72%	28%

34. Are USDA cost sharing programs for agricultural practices effectively responding to agricultural nonpoint pollution problems in your state?

Yes	Partially	No
2%	79%	19%

35. Has your state documented specific instances where NPS controls failed to yield a desired water quality response?

Yes	No
17%	83%

36. Please check the sources being controlled and the control methods being used. *

(Check those controls that are being implemented by your state)

	Education/ Voluntary	Cost Sharing	Tax Incentives	Regulatory
a. Agriculture	98%	70%	12%	23%
b. Silviculture	70%	7%	2%	19%
c. Mining	28%	2%		77%
d. Construction	67%		2%	56%

* Some states included federal and local programs. These percentages are based on entire 43 states answering the questionnaire.

e. Urban runoff	63%	2%		40%
f. Other (explain)	12%	2%		19%

37. Have local governments in your state taken steps (local ordinances, land use controls, educational, etc.) to control nonpoint sources?

5%	29%	67%
Generally Yes	Several Have	Only a Few Have

38. Does your state have state funding for nonpoint source pollution control in the following categories:

a. Agriculture	38%	62%
b. Construction	7%	93%
c. Mining	20%	80%
d. Silviculture	10%	90%
e. Urban nonpoint sources	7%	93%
f. Other, please specify		

39. Does your state have a state funded lake restoration program?	20%	80%
40. Does your lake restoration program currently have funds appropriated for it?	14%	86%
41. Does your state support* federal match programs for nonpoint source assessment?	81%	19%

42. Does your state support federal match programs for nonpoint source pollution control in the following categories?

a. Agriculture	78%	22%
b. Construction	41%	49%
c. Mining	44%	66%
d. Silviculture	51%	49%
e. Urban nonpoint sources	57%	43%
f. Other, please specify		

43. Does your state favor continued funding for 314 Clean Lakes Program?	91%	9%

* i.e. the State water pollution control program support

		Yes	No
44.	Does your state use 205j funds for NPS activities?	73%	27%
45.	Does your state believe that there is adequate federal legislation on the books to cover NPS activities?	46%	54%
46.	Does your state favor regulatory approaches for the following categories?		
	a. Agriculture	21%	79%
	b. Construction	71%	29%

29e URBAN NONPOINT SOURCES AS A CONTRIBUTION TO WATER POLLUTION

Mr. ROE. The gentleman from Georgia.

Mr. ROWLAND. Thank you, Mr. Chairman.

You indicated in your testimony that we should have compliance with the best available technology as soon as we can after the effluent guideline promulgation comes into effect. I have heard testimony that with publicly owned waste treatment facilities, there has been a combination with some areas where industry got involved with publicly owned waste treatment.

Would you comment on that and how you think that would work?

Mr. LEDBETTER. Where we have the industry and city working together?

Mr. ROWLAND. Right.

Mr. LEDBETTER. In one case, Macon, Ga., in your district, Mr. Congressman, we after several extensive pilot plants, showed that by mixing the two wastes we got a higher degree of treatment. They were compatible, in other words. And by mixing the industrial waste water and municipal waste water, we had a higher degree of treatment for the two wastes.

So it can be very beneficial in many cases. We can better protect the receiving water. The key thing is to be sure that there is not any toxic or hazardous pollutants in the industrial waste water that would have an adverse impact on the integrity of the publicly owned treatment works. But it can work, and we have got several projects in our own State where it has worked quite successfully.

Mr. ROWLAND. Do you think that would bring about some savings, not only to industry but to municipalities, also, with the construction of the facility and whatever the product might happen to be that is being manufactured that has the waste produced?

Mr. LEDBETTER. Yes, it brings about some saving because the studies that have been made, of course, address the issue of cost effectiveness. You always evaluate the cost of them going independently as well as going jointly.

But another very important aspect of that is that if you look at this Nation as a whole, you have got many, many industries that could not discharge as point sources where they are located. There is nothing in which to discharge other than a storm sewer or drainage ditch, that would meander through maybe a developed community for a number of miles before it could get to a river.

So it is very important that we continue to promote industry working with the publicly owned systems to put their waste water into those when you are in those kinds of situations. It is more cost effective. It is wiser from an environmental standpoint.

The key thing is for us to put into place the pretreatment program that I have talked about and then use the toxicity elimination strategy to make sure that is effective.

Mr. ROWLAND. Thank you very much, Mr. Chairman.

Mr. ROE. Any questions, Mr. Albosta?

Mr. ALBOSTA. Mr. Chairman, thank you.

I thank you for being here and the excellent testimony to the committee, Mr. Ledbetter, that I think is helping us to make decisions. But I am concerned about nonpoint sources of pollution. Michigan has the right-to-farm law. This may be unique in the

Nation. I am not sure. But I am not sure, you could say that most of it is coming from agriculture.

The gentleman from Minnesota, I think, asked you the question of what were those pollutants. I don't recall that I heard you answer it, or don't you know exactly what they are?

Mr. LEDBETTER. Well, those vary, of course, from one agricultural activity to another. The No. 1 problem is simply soil erosion. That is the number one problem from the agricultural community throughout the country.

Secondly, depending if you are in the East or the West, it could very well be the salt problems related to irrigation return flows in the West. In many of our States, like my own State, where we have in the southern half of the State extremely sandy soils, leachate of ammonia, the fertilizer, nitrogen, pesticides, herbicides, are problems that we encounter in many cases there.

But so far the level that we have detected in all of our studies have been such that those levels of concentration do not preclude meeting the designated use, which in most cases will be fishing.

Mr. ALBOSTA. Have you had any problems with any of the States that you have encountered where they don't have the funds, or are cutting back on staff, would have problems trying to implement sections of the act?

Mr. LEDBETTER. Yes.

Mr. ALBOSTA. Michigan, for instance, has cut back I believe about 15 percent on the number of State employees because of real tough financial problems that the State has encountered.

Mr. LEDBETTER. We have had to cut back a small percentage in Georgia because, as you know, most of the States are required by their constitutions to live within a balanced budget. The State of Oregon, I know, had a significant reduction. I think they almost cut their staff in half due to the economy's impact on their State revenues. I know about your own State of Michigan and the problems of the economy there.

Basically, what we in the States have said is that if Congress will continue to provide the funds under the Clean Water Act, section 106 particularly and section 205 (g) and (j), that we can continue to administer an effective program. As you know, the former Administrator of EPA was urging that those funds be reduced by as much as 50 percent and eventually eliminated. We cannot be effective in carrying out effective programs with such reductions.

But we do believe, and the Nation's Governors, for example, have a policy position that they have adopted saying, "Continue that funding at the current level, and we can be effective in managing the program." I think in most States that would be the case.

Mr. ALBOSTA. I think what you are saying, then, is that it would almost be essential that the States get some assistance from the Federal Government in order to implement their part of the program?

Mr. LEDBETTER. Yes, sir, especially since if you look at the Clean Water Act in cases like myself where I was there many years in the State program before the Clean Water Act, it is a more expensive program to administer today due to the various procedures dictated to us under the Clean Water Act. So it is more costly and,

20-955 O—84——169

therefore, we think the Federal Government should continue to contribute to the management of that program in a financial way.

Mr. ALBOSTA. I thank the gentleman. I don't have any further questions, Mr. Chairman.

Mr. ROE. Mr. Sunia?

Mr. SUNIA. No questions.

Mr. ROE. Any further questions?

We want to thank you very much, Mr. Ledbetter, for your excellent testimony. It will be very helpful to us. You are giving us a good oversight as to what States are thinking at this point. We appreciate your help very much.

Mr. LEDBETTER. Thank you, Mr. Chairman.

Mr. ROE. Our next witness this morning is Mr. Charles Kaiser, Jr., assistant executive director and general counsel, Metropolitan St. Louis Sewer District and chairman of AMSA Legislative Committee representing the Association of Metropolitan Sewerage Agencies.

The full text of your prepared statement will appear in the record at this point.

[Statement referred to follows:]

REMARKS BY CHARLES B. KAISER, JR., ASSISTANT EXECUTIVE DIRECTOR AND GENERAL COUNSEL, METROPOLITAN ST. LOUIS SEWER DISTRICT ON BEHALF OF THE ASSOCIATION OF METROPOLITAN SEWERAGE AGENCIES

Mr. Chairman, my name is Charles B. Kaiser, Jr. and I am the Assistant Executive Director and General Counsel of the Metropolitan St. Louis Sewer District and Chairman of the Association of Metropolitan Sewerage Agencies' Legislative Committee. I appreciate this opportunity to present the Subcommittee with AMSA's views on the major clean water issues of concern to our members. AMSA's members serve more than seventy-seven million people in 94 of the nation's major urban areas, and treat over fifty percent of the wastewater subject to existing federal pretreatment mandates across the country.

One of these issues, a most critical one relating to the future federal financial commitment to the construction grants program, is addressed by H.R. 3282, the Water Quality Act of 1983. The other major issues I will be discussing, such as pretreatment, sludge management, common law, and municipal compliance, are not covered by this proposed legislation, but are included in companion legislation in the Senate. Accordingly, our testimony will address these and other issues in our recommendations on Clean Water Act amendments that are most responsive to the needs of the nation's major metropolitan sewerage agencies.

PRETREATMENT

AMSA has been at the forefront of the pretreatment debate for many years. During this time, we have worked with EPA, the states, and others to fashion a sensible approach to achieving the goals of the law. We have been strong advocates of good pretreatment programs because our members are ultimately responsible for regulating toxic waste discharges into their systems. More importantly, we are the ones who are ultimately accountable to EPA, the states and our own citizens if failure to regulate these discharges results in environmental damage. Many of our members already had effective industrial waste control programs prior to 1972, when the concept of Federal pretreatment requirements was first imposed. Most of our members now have programs that comply with, or are awaiting EPA or state approval of, Federal pretreatment requirements. In many cases, these agencies require industry to meet even more restrictive discharge limitations than those that have been promulgated or are under consideration by the Environmental Protection Agency, because the restriction is necessary for plant, sludge, or environmental protection.

AMSA member agencies are the strongest advocates of effective pretreatment programs at the local level, and they support Federal regulatory requirements that POTWs develop and implement such programs. At the same time, AMSA is highly critical of the national pretreatment program's assumption that a single nationwide

strategy based on national categorical standards is uniformly appropriate throughout the nation. We believe that the basic objective of pretreatment—to protect water and sludge quality, to protect plant operations, and to prevent the pass-through of pollutants—relate to site-specific problems and require site-specific solutions. Accordingly, we favor an approach that would enable capable local agencies, with effective local programs and standards in place, to move forward on their own and to avoid burdensome administrative and economic disincentives associated with implementation of national categorical standards at the local level. Federal categorical program requirements should apply only to those local agencies that are either unwilling or unable to develop and implement effective programs on their own.

Our position has the strong support of local and state officials. Indeed, up until several months ago, EPA and the Senate Subcommittee on the Environment also supported local flexibility for pretreatment program implementation. This latter support, evidenced by legislative proposals considered by the Senate, would have enabled POTWs with good pretreatment programs to continue to move forward on their own. Although this proposed legislation was more stringent in its pre-conditions than we thought necessary to guard against possible abuse, we gave it our strong support and urged its enactment into law. However, the Senate subcommittee deleted this provision from its bill prior to reporting it to the full committee.

We understand that EPA is in the process of establishing a pretreatment task force to address regulatory remedies to the problems faced by the pretreatment program. EPA believes that, through this mechanism, they will be able to respond to the concerns faced by those attempting to implement the current program. While such an effort is laudatory after five years of wrestling with program implementation, and AMSA wil cooperate with the Agency and participate on this task force in an effort to facilitate administration of the existing program, we feel quite strongly that the nature of the program's problems require immediate legislative redress.

We believe that the pretreatment issue deserves this subcommittee's serious attention and consideration, and that any Clean Water Act legislation reported should include provisions authorizing the implementation of alternative pretreatment systems by capable POTW's. Over the past several months, we have worked closely with representatives of state and local organizations as well as other interested parties to develop an approach that addresses the needs of the sewerage agencies who must implement pretreatment programs while avoiding the difficulties associated with earlier proposals to modify the pretreatment provisions of the Clean Water Act. This approach would enable qualified local agencies to operate an alternative pretreatment program following a demonstration statisfactory to the state or EPA that the program would achieve the objectives of the national pretreatment program. It would also require these agencies to establish a monitoring program to ensure that the program adequately and continuously protected the receiving waters.

In our view, this approach would expedite the enforcement of toxic controls at the local level and enhance environmental protection throughtout the nation. By relying on local standards, set at site-specific levels necessary to protect plant operations, guard against pass-through, and ensure a sludge quality that meets state and federal requirements, we can have immediate effective pretreatment, rather than awaiting some undetermined time in the future when national categorical standards are finally promulgated for all of those industries subject to regulation by the national program. More important, qualified local agencies will be able to avoid the administrative headaches of the national categorical standard process, including those related to removal credits and combined waste streams. Finally, there are many cases where local standards are more stringent than those now being considered by EPA. The existence of less stringent categorical standards may, from a political standpoint, result in the downgrading of local efforts and standards. An alternative program would enable qualified POTWs to justify their programs not only politically, but also economically and legally, without sacrificing environmental objectives.

Our approach would enable all levels of government to conserve scarce resources. The implementation of such a program would represent a simple extension of what EPA and the states are required to do at the present time in approving local pretreatment programs for approximately 2,000 municipalities around the country. Our approach would enable EPA and the states to concentrate their limited resources on problem municipalities, while leaving the larger, more capable agencies on their own with a limited annual accounting required. This would enable EPA and the states to conserve both money and man-hours. Equally important, our approach offers potential savings to municipalities, who are now required to expend substantial sums to comply with all of the annual reporting and other procedural requirements for each of the categorical standards in effect within their jurisdictions. Ex-

penditures such as these, which are not going to result in further environmental improvement, could be saved under our approach.

In the final analysis, the pretreatment debate centers on whether the Federal or local level of government is best equipped to develop and implement effective pretreatment controls. There is no question in our minds as to who that is. Pretreatment problems are site-specific and require site-sensitive solutions. National categorical standards are not designed to address varying local conditions and are not premised on any water quality, plant protection, or sludge quality considerations. Locally derived standards, which in some cases may have to be more stringent and in other cases less stringent than applicable national standards, do consider these factors and are, accordingly, easier to justify and enforce because they make sense in the local context.

Our alternative pretreatment approach would enable local agencies to tailor solutions to meet the site specific, environmental needs of their communities in a cost efficient manner. Much time has already been lost. Municipal agencies need to know now whether they will be able to move forward with their locally designed solutions to local problems or whether they will have to impose expensive, insensitive national requirements that will not provide any greater degree of environmental protection than if they were allowed to proceed on their own. We again urge the Committee to support an alternative pretreatment approach, and we are willing to assist in any way with the development of a proposal that would accomplish this objective.

SLUDGE MANAGEMENT

AMSA is also deeply concerned over the burden of conflicting demands imposed by the various statutes which regulate sludge management options and practices available to local wastewater agencies. This has resulted in the issuance of uncoordinated regulations and guidelines, placing additional burdens on local agencies in their efforts to approach sludge management on a cost-effective, long-term basis. This failure of EPA to issue guidance for some management options has only served to compound an already critical situation.

The Association supports the concept of a single comprehensive sludge management policy within EPA, the linchpin of which would be a coordianted set of regulations and guidelines which would assist local agencies to select the best sludge management option, or options, after review and consideration of human health, environmental, social, economic and other relevant factors. Without such a comprehensive policy to bridge the gap between the decisions that have already been made regarding effective ways to treat wastewater and the decisions that have to be made about the ways to dispose of or reuse the products of the treatment process, more precious time and money will be wasted.

To accomplish our objectives in the sludge management area. AMSA has been working closely with EPA's sludge management task force, which was established to develop a comprehensive set of sludge management guidelines. We believe that this agency task force has made a great deal of progress, and we are now eagerly awaiting the initial output of its work effort. The approach that the agency is taking has been reviewed by AMSA member agencies throughout the country and has met with their approval. Accordingly, we believe that the EPA task force should be allowed to continue its work unhindered by additional statutory directives that would likely only delay completion of a long overdue comprehensive sludge management policy document. It would be premature at this time to enact additional provisions affecting this extremely important area.

FUNDING AND ENFORCEMENT

AMSA endorses a plan to accelerate municipal compliance which addresses the special needs of major metropolitan sewerage agencies with respect to both federal funding and enforcement policy. This plan calls for continued federal grant support at levels necessary to accomplish the objectives of the Clean Water Act, joined to a municipal compliance policy taking into account the complex technical, regulatory, and political considerations that are particularly evident in the large, metropolitan areas of our country. Failure to deal with these issues in a positive manner will only result in further delays in achieving the noteworthy goals of the Clean Water Act.

We wholeheartedly endorse H.R. 3882's provisions increasing the spending authorization and of appropriation are woefully inadequate to enable the nation's communities to achieve the federally mandated requirements within the specified timeframes.

The current funding picture represents a breach of the federal-local compact that was agreed to in the mid 1960's as the basis for the major rewrite of water pollution control legislation. At that time, local agencies were given to understand that the federal government would contribute the billions of dollars needed to assist the local wastewater treatment agencies in constructing needed facilities within the mandated timeframes of the Clean Water Act. While costs have escalated and the overall program has become more and more complex, the timeframes for municipal compliance have remained fairly rigid. It is now time to reevaluate the construction grants program with a view towards renewing the federal-local compact that was the foundation of the 1972 Act and to make a clear statement of intent acknowledging an enforcement strategy that takes into account federal funding.

In 1981, we conducted a survey of AMSA member agencies to assess their wastewater treatment facility construction needs to meet Clean Water Act requirements. That survey indicated total needs for all funding categories, including combined sewer overflow correction, of roughly $20 billion. Assuming a 75 percent federal share, AMSA members needed roughly $15 billion in federal grants in 1981 to complete the federal program. A copy of our survey results is included with our testimony. AMSA is currently updating this survey and will make these results available to the Committee as soon as they are available. A quick comparison of our members' 1983 and 1981 returns indicates, however, that the results are going to be in the same ballpark.

Iwould like to emphasize that the 1981 amendments to the Clean Water Act, which reduced the categories eligible for funding October 1984 and dropped the federal share to 55 percent, did not reduce AMSA member needs. These provisions, as well as others which we opposed then and continue to oppose, simply shifted $8 billion of needed construction from the federal to the local level. This funding shift only makes it more difficult for economically strapped urban areas to aggregate the large sums necessary to proceed with and complete ongoing projects within the timeframes required by law.

Based on our survey results, AMSA member agencies would require $1.5 billion per year for 10 years to meet the Act's requirements. This, in our view, is not out of line with current budgetary constraints on the Federal Government. An increase of the current appropriations to $3 billion per year, for example, would enable the large metropolitan centers throughout the country to meet the act's stringent requirements with one-half of the available appropriations. This would not represent an unreasonable compromise, especially considering the more severe water quality that these large cities face.
